NOMINALISM AND REALISM. See SCHOLASTICISM.

NOMINATIONS, POLITICAL. The nomination of several candidates for an office may be said to be a prerequisite in any election in which a number of people vote. The nominations serve to concentrate the attention of the electorate upon relatively few persons, so that the victor will represent the choice of more than a very small proportion of the electorate. Even in assemblies in which all the electors are present in person, as in a legislature, nomination of

candidates, whether from the floor or in advance by some caucus (*q.v.*), has generally been found necessary. Under modern democratic government, with its wide franchise, the conduct of elections without some preliminary process of nomination would be practically impossible.

Unless the number of candidates is greater than the number of offices to be filled, nomination and election become practically the same process. Such is frequently the situation in England, where certain parliamentary seats are "uncontested." The Italian system of submitting to the electorate a single full roster of candidates for the Chamber of Deputies, to be accepted or rejected in toto, is unique in the extent to which it equates nomination to election. Substantially the same effect is obtained where control by a particular party is very strong; nomination by the Democratic party in the ten states of the "solid South" in the United States or by the Republican party in certain northern and western states is tantamount to election. Recognition of this fact has led to increased state regulation of the nominating process in some states in which this situation prevails. In order to make certain that the ultimate choice shall represent more than a very small proportion of the entire electorate, these states have provided for a double, or "run-off," primary or for the use of preferential voting in the primary.

In most countries the choice of the voters at the election is confined to those who have previously acquired the legal status of candidates by the appropriate method. In the United States, however, as in a few other countries any qualified person may be elected, even though he has not been nominated and his name has not been printed on the ballot. In all but about six states the voter is expressly permitted to "write in" the name of his choice. This right of election without nomination is, however, more theoretical than real. Especially in the larger communities cases of election of persons whose names were not on the ballot are almost unknown.

Outside the United States legislative bodies have given little attention to the subject of nominations. They have ignored the process by which parties and other political groups concentrate their strength behind particular candidates and have confined themselves to laying down formal and rudimentary requirements. The French law says nothing whatever about candidacy for election to the various local councils—communal, district and departmental; with respect to the Chamber of Deputies, the law provides merely

that the candidate may run in only one constituency, which must be specified in advance. This limitation was adopted in 1889 to prevent the recurrence of such a situation as that which arose when General Boulanger won large majorities in various constituencies.

The system of self-announcement, still in use in France, was employed in England until 1872, when it was replaced by nomination by petition. The petition, signed by ten registered voters of the constituency, must be filed on the eighth day following the proclamation summoning a new Parliament. It must be accompanied by a deposit of £150, which is forfeited if the candidate fails to poll more than one eighth of the total vote. This requirement, intended to discourage frivolous candidacies, applies only to parliamentary elections. The dominions follow the British practise with some variation.

Nomination by petition prevails in those countries of continental Europe which have adopted the list system of proportional representation. When the party lists are filed, some time in advance of the election, they must be supported by a specified number of signatures, which is generally relatively small—one hundred in Belgium and Austria, five hundred in Germany. Attempts by some of the German states, such as Hesse in 1927, to increase considerably the number of signatures and to require a large deposit which would be forfeited if no candidate on the list were elected have been held unconstitutional by the Staatsgerichtshof. Candidates for the German presidency are likewise nominated by petition, but the discrimination in favor of existing parties through the requirement of a large number of signatures for new parties tends to reduce the number of presidential candidates. This tendency is furthered by the fact that there is a single indivisible office to be filled. As a result the individual party usually enters a coalition backing a single nominee instead of running its own candidate. This becomes especially apparent where a second ballot is required. Thus in the German presidential election of 1925 there were seven candidates in the first election and only three in the second. In the 1932 election there were five on the first ballot and only three on the second.

In colonial America the system of self-announcement was taken over from England by some of the colonies, including Georgia and Virginia. Other colonies experimented with various methods of nomination. For a time East Jersey, like Greece and some of the mediaeval

communes, used the lot as an important element in the nominating system. Some of the New England colonies at one time employed a rudimentary form of direct primary. One of the methods developed in Massachusetts was the caucus, which gradually spread until it became the predominant way of making nominations in the United States, being applied even to the presidency through 1824. Efforts to democratize and broaden the nominating process led to the introduction of the delegate convention system, whereby conventions were called in the various units of the governmental hierarchy for the purpose of setting up slates of candidates and determining the party platform. With the development of abuses in this system and under the impetus of the movement for more democracy to cure the ills of democracy, it was replaced to an increasing extent by the direct primary system (*see* CONVENTION, POLITICAL; PRIMARIES, POLITICAL). The nomination of the president continued, however, to be made by national conventions called especially for this purpose, although there was at one time a movement to substitute presidential primaries.

The problem of nominations in the United States is the subject of perpetual controversy and of elaborate statutory regulation. In New Jersey and South Dakota, for example, the direct primary law is as elaborate as the law governing the general election. Statutes in the United States distinguish between party nominations and independent nominations. The latter take the familiar European form—the filing of a petition—but usually burden the candidate with the necessity of securing hundreds or thousands of signatures. In many states certain offices are termed non-partisan; no party designations are permitted on the ballot and all nominations must be by petition.

It is in the matter of party nominations that the peculiar character of American practise is revealed. Party candidates take their place on the election ballot as of right and without the formality of a petition. They do so because the law, having deprived the party of its original status as a voluntary association, now orders all its most intimate and significant concerns, determining how candidates shall be nominated and platforms framed, even who shall belong to the party and who shall lead it. The method of making nominations is prescribed in great detail. When the members of a party attend a primary and either nominate candidates or else choose convention delegates who will nominate

them, the proceedings are conducted precisely as in the case of public elections. The party has been integrated with the government as an acknowledged official agency. This momentous change came in most states at the turn of the present century.

The institution of legislative control has generally been considered a consequence of the corruption of American parties in the decades following the Civil War. It may be argued, however, that even without such control the people would in the long run secure the type of candidate they desire. Candidates are nominated in order to be elected; they are manufactured, like industrial commodities, in order to be sold, the Republican brand competing with the Democratic brand in a common market and facing, like its rival, the competition of independent producers. Under such circumstances a discriminating electorate can impose its own standards. Certainly European experience has not yet suggested the need or even the desirability of statutory regulation. Nor can it be said that regulation has altogether justified itself in the United States. So small a percentage of the electorate takes part in the primaries that as a rule the "organization" or "machine," whose adherents always do vote, not only finds its position little impaired but thus escapes responsibility for nominations which in theory proceed from the people.

The reasons for legislative control must therefore be sought in more fundamental influences than the desire to purify party politics. In the first place, the United States differs from other countries in that it extends the principle of election to a multitude of offices, so that the voters are confronted with the so-called long ballot, which may list as many as thirty or forty offices to be filled on election day. Incapable of making a choice of their own, the voters fall back on the party ticket. They are not in a position to discriminate between individual candidates and thus hold the party to a high standard in making nominations. While the obvious remedy is a drastic reduction in the number of elective offices, the reformers chose instead to subject the primaries to public supervision. A second factor is the nature of the two chief American parties. For a generation the divergence between them has been less clear perhaps than that between progressive and conservative factions within each. Moreover in certain areas one party has enjoyed such predominance that nomination has been the equivalent of election. Great im-

portance has attached therefore to the outcome of the primaries. Finally, the statutory control of parties may mark an inevitable stage in the development of democratic political institutions. A comparative time chart would show how far in advance of England and France, for example, the United States established manhood suffrage and set up the powerful party organizations which are necessary to regiment a vast electorate. The direct bearing of these party organizations upon the character of the government and their capacity to work great injury to the general welfare first became manifest in the United States. The countries of western Europe are perhaps moving toward a similar stage of statutory regulation.

A survey of the methods by which the political parties in England or in Germany select their candidates before complying with the simple formal requirements reveals a similarity to the American procedure more striking than the contrast, notwithstanding differences in national character, in political institutions and in length of experience with democratic self-government. In theory control over nominations rests, in Europe as in America, with the mass of party members. German parties, for example, are organized very much as American parties were before the advent of the direct primary: a hierarchy of conventions and committees corresponding with political units and depending ultimately upon the rank and file. The annual convention elects a party council (*Parteiaus-schuss*) and a much smaller executive committee (*Parteivorstand*), the latter being sometimes chosen instead by the council. In each of the thirty-five election districts the list of candidates is prepared sometimes by the convention but more often by the executive committee, which may or may not submit it to the convention for approval. In practise, however, the central, or national, committee exerts considerable influence over the composition of the district lists. It also compiles the national list, putting certain favored leaders at the head and thus insuring their election in case they are defeated in the districts. Candidates are picked apparently for their "regularity" rather than for personal qualities or as a result of pressure by economic or other groups within the party.

Parliamentary candidates in Great Britain are "adopted" by the party association in each constituency or rather by the large executive committee which the members of the association have elected. In fact this committee merely rati-

fies the decision of a small subcommittee, which in its turn may have been influenced chiefly by suggestions from the central office of the party in London. Above all, the candidate must be a man whose support of the party leader can be depended upon. The rules of the Labour party require endorsement of the candidate by the national executive.

NORDAU (SÜDFELD), MAX SIMON (1849-1923), German scientist, publicist and Zionist leader. After completing his training in medicine Nordau in 1880 went to Paris, where until the outbreak of the World War—and again from 1918 to 1923—he practised medicine and contributed to various periodicals, both technical and popular. His first systematic work, *Die conventionellen Lügen der Kulturmenschheit* (Leipsic 1883; translated Chicago 1884), and his

Paradoxe (Berlin 1885; tr. by J. R. McIlraith, London 1896) enjoyed sensational success and established the reputation of the author as an outstanding social theorist. The appearance of *Entartung* (2 vols. Berlin 1892-93, 2nd ed. 1893; tr. as *Degeneration*, London 1895) with its biologically grounded thesis of the degeneration of European culture created even more of an intellectual furor and went far toward popularizing a concept which hitherto had found only esoteric expression. His *Der Sinn der Geschichte* (Berlin 1909; tr. by M. A. Hamilton, London 1910) and his *Biologie der Ethik* (Leipzig 1920; tr. by M. Lewenz as *Morals and the Evolution of Man*, London 1922), written during his years of exile in Spain from 1914 to 1918, exerted a far more limited influence.

Nordau felt little sympathy with the dominant aesthetic and intellectual trends of the late nineteenth century. His rationalistic and scientific outlook made him suspicious of any cult of the irrational, the mystic or the amorphous. His faith in the doctrine of human solidarity provoked him to biting invective against the individualistic and antisocial schools of literature, aesthetics and philosophy. His belief in the pragmatic value, from a societal point of view, of individual morality and conscience made him impatient with the currently accepted gospel of the amorality of art. Criticizing savagely the works of Wagner, Nietzsche, Tolstoy, Ibsen and many other less illustrious exponents of what he designated as "modernism," he was led, under the influence of Lombroso and Morel, to the conclusion that these abnormalities in the realm of creative art were but symptoms of a pervasive tendency to racial degeneration. As an antidote to the hysteria and pessimism infecting modern thought he prescribed a wholesome regime of "spiritual hygiene," compounded in the main of enlightened altruism, intensive work, subordination of the instinct to reason and above all pursuit, in a true scientific spirit, of undistorted truth. In his efforts to break away from what he felt to be prevailing misrepresentations in the fields of historiography and philosophy of history Nordau sought to formulate a truly scientific approach to history, freed from a priori, *sub specie aeternitatis* postulates and especially from anthropocentric or one-sided teleological premises. The true philosophy of history he defined as "sociology looking backward" and he emphasized the value of individual psychology, biology and anthropology as aids to the historian in his

efforts to reconstruct the social group in its natural setting and recreate the living unity of human evolution.

An outstanding figure in the Zionist movement, Nordau analyzed with almost unrivaled insight the problem of Jewish assimilation and with deep fervor lamented the tragic status of the Jews in western European culture. Because of his well established reputation as an author his addresses before successive Zionist conferences, pleading for an aroused and independent Jewry, found an echo in the widest circles. Carrying on in the tradition of Herzl, he assisted in drawing up the Basel Program of 1897 and championed the eventually unsuccessful project for Jewish colonization in Uganda. When in 1911 the leadership of the Zionist movement passed into the hands of the so-called "practical" wing, Nordau headed the opposition and continued to exert a deep influence on the Zionist movement long after his prestige as critic and philosopher had begun to dim.

NORDENSKIÖLD, NILS ERIK (1877-1932), Swedish ethnographer. Nordenskiöld, who was trained in zoology, made a palaeontological expedition to Patagonia in 1899; his interest, however, soon shifted to anthropology and he made a series of ethnographic and archaeological trips to Bolivia, Argentina, Peru, Brazil, Panama and Colombia. In 1913 he became director of the ethnographical division of Göteborg Museum and in 1924 professor of ethnography at Göteborg Högskola. His outstanding contributions appeared in English in nine volumes under the general title *Comparative Ethnographical Studies* (Göteborg 1919-31), and some of his works were also widely read in German translations.

Nordenskiöld was primarily concerned with the technological aspects of culture but also recorded myths and social practises. His attitude toward the aborigines is reflected in sympathetic sketches of several tribal cultures as wholes. His major contribution lies in the meticulous determination of trait distributions, which he established by exploiting simultaneously historical sources, ethnographic observation and archaeological finds. He was a master of ethnographic

cartography and imparted the technique to his school, which includes G. Montell, A. Métraux, S. Linné and K. Isikowitz. On the basis of distributions he inferred historical relationships, and although generally cautious he was not opposed to the theory of trans-Pacific cultural connection between South America and Polynesia. He insisted, however, on the independence of the basic features of New World culture.

NORMAN, GEORGE WARDE (1793–1882), English economist. Known generally only as one of the three leaders of the English “currency school,” which developed and defended the principles on which Peel’s Bank Charter Act of 1844 was based, Norman exercised considerable influence on the general development of economic thought during an extraordinarily long and active life. He had followed his father in the Norway timber trade, becoming a director of the Bank of England in 1821, a position which he held with short interruptions until 1872. From 1830 to 1864 he was also a director of the Sun Insurance Office. In 1821 he joined the newly founded Political Economy Club and remained a member for sixty-one years. Although he opened discussions at this club as early as 1822, his first pamphlet was not printed until 1833 and then only for private circulation. This pamphlet was an outcome of the discussion occasioned by the Althorp Committee of 1832 on the bank charter, before which Norman gave evidence as one of the representatives of the Bank of England. It contains what is probably the earliest statement of the aims of the currency

school by one of its members and attracted considerable attention when it was published five years later in a slightly expanded form and under a somewhat different title. By his subsequent publications and the evidence which he gave to later parliamentary committees, in 1840, 1848 and 1857, as well as by his activities at the bank itself Norman did much to shape the bank’s policy. He did not agree on minor points with his chief associates, Lord Overstone and Colonel Torrens, and he joined issue with the latter on the question of protection. He wrote also on taxation and was a lifelong advocate of a single tax on all property. A clear and penetrating writer, he contributed many articles to the *Spectator*, the *Economist* and other publications and finally collected some of these miscellaneous writings into a volume entitled *Papers on Various Subjects*.

FRIEDRICH A. HAYEK

Works: *Remarks upon Some Prevalent Errors with Respect to Currency and Banking and Suggestions to the Legislature as to the Renewal of the Bank Charter* (London 1833); *Remarks upon Some Prevalent Errors, with Respect to Currency and Banking, and Suggestions to the Legislature and the Public as to the Improvement of the Monetary System* (London 1838); *A Letter to the Rate Payers of the Parish of Bromley, on the Propriety of Building a Central Workhouse for the Bromley Union* (London 1838); *Letter to Charles Wood, Esq. M. P., on Money, and the Means of Economizing the Use of It* (London 1841); *An Examination of Some Prevailing Opinions, as to the Pressure of Taxation in This, and Other Countries* (London 1850, 4th ed. 1864); *Remarks on the Incidence of Import Duties, with Special Reference to the England and Cuba Case Contained in “The Budget”* (London 1860); *Papers on Various Subjects* (p.p. London 1869); “The Future of the United States” in *Royal Statistical Society, Journal*, vol. xxxviii (1875) 64–78.

NORTH, SIR DUDLEY (1641–91), English merchant, economist, civil servant and politician. One of the famous North brothers, a self-made man grown rich in trade, a prominent Tory politician and an able customs official, he is now remembered chiefly for his one small tract, published in the year of his death. This tract was lost from view until 1822, when it was rediscovered and reprinted, and it therefore had no influence on the subsequent course of thought. North shows herein remarkable freedom from the current economic notions of his time, and in a series of brief statements and aphorisms rejects many of the most fundamental mercantilist doctrines. All trade which is profitable to the trader is claimed to be profitable to the public; but government restrictions on

trade, while possibly profitable to a few traders, are injurious to the public. Foreign trade should not be dealt with differently from domestic trade, for "a nation in the world, as to trade, is in all respects like a city in a kingdom, or family in a city." Money is merely a merchandise which can exist to excess. A country automatically acquires the amount of money it needs; regulation of trade in bullion is not necessary to assure an adequate supply. If there is a greater supply of money than is needed, it falls in value, is melted down and exported in spite of legal prohibitions. Low rates of interest can result only from prosperity, from a large number of lenders relative to the number of borrowers. Legal restriction on the rate of interest leads to evasion and hoarding. Debasement of the currency is dishonest and injurious, but a seigniorage charge should be made for coinage in order to check wasteful melting and re-minting, and there should be a recoinage of the clipped money at the expense of the holders thereof. Although North thus anticipated many of the later laissez faire and free trade doctrines, he presented his views somewhat dogmatically and without adequate recourse to reasoned analysis.

NORTHCLIFFE, FIRST VISCOUNT, ALFRED CHARLES WILLIAM HARMSWORTH (1865-1922), English journalist and newspaper proprietor. Northcliffe, who was born near Dublin, left school at the age of fifteen and engaged in free lance journalism. In 1888 he founded his first paper, *Answers to Correspondents*, a popular weekly inspired by the success of George Newnes' *Tit-bits*. Newnes may be regarded as the forerunner of the new journalism in England, but the idea of using a newspaper to make

a profitable rather than a political appeal to the new half-educated British public to which Victorian newspapers did not cater developed in Lord Northcliffe's hands until he became the proprietor of the largest periodical publishing company in the world. In 1894 he acquired the *Evening News*; in 1896 he founded the *Daily Mail* (the first halfpenny daily), in 1903 the *Daily Mirror*, in 1905 the continental *Daily Mail*; in 1908 he took over the *Times* and in 1914 the *Weekly Dispatch*. In building up his newspaper syndicate, which by the time of his death included in all some seventy newspapers and magazines, Lord Northcliffe was assisted greatly by the financial skill of his brother Lord Rothermere.

Northcliffe's dominating position in the press gave him great political influence during the World War. In the spring of 1915 he exposed the shortage of munitions and attacked Lord Kitchener while he was still the nation's hero (the *Daily Mail* on this occasion was burned on the Stock Exchange). The Northcliffe press helped to form the Asquith coalition of 1915, led the campaign for conscription and played a crucial part in the final events which brought about the Lloyd George coalition of 1916. After declining the post of British ambassador at Washington, Northcliffe was appointed chairman of the British War Mission to the United States in 1917 and in 1918 became director of propaganda in enemy countries.

Although opinions are divided as to the nature of Lord Northcliffe's influence, the following points may safely be made. As he himself pointed out in his pamphlet *Newspapers and Their Millionaires* (London 1922), he differed from most other big newspaper proprietors in that he was a journalist who became a millionaire and not a millionaire who acquired papers as a hobby. The commercialism and the trustification of the press which he promoted resulted in the displacement of the independent political editor, who became increasingly subordinate to the business manager and the proprietor; this drove out many political papers of the older type and tended to reduce journalism to a branch of commerce. While he destroyed the traditions and independence of British journalism, Northcliffe improved the working conditions and wages of journalists and printers. He admittedly had a genius for gauging "what the public wants," a phrase which, after Northcliffe, came to mean what the public can most easily be persuaded to buy. Perhaps the reason for his

immense success was, as Sir Norman Angell has suggested, that Northcliffe himself shared the instincts and prejudices of most of his readers, that he was an extraordinarily ordinary man, a genius if only because he himself really was "the man of the street."

NOTARIES, PUBLIC. Notaries are public officers charged with functions of varying importance in the administration of law. Like many modern legal institutions, the office of the notary can be traced back to Roman origins. The forerunners of the modern notary were, however, not the *notarii* (or *scribae*) of the early Roman Empire, who were usually slaves employed for taking notes of judicial proceedings, but the *tabularii* and the later *tabelliones*, who made their appearance about the time of Ulpian. Their public character was fully recognized and their functions, such as keeping public records and drafting and witnessing legal documents, were regulated minutely in Justinian's time. During the centuries of unrest and agitation following the collapse of the Roman Empire little resort was had to orderly legal processes and the need for legal documents was rather slight. Assistance in such matters, when required, was rendered by the only class of the population which at that period was conversant with the art of writing, the clergy. Traces of the ecclesiastical character of the profession of the mediaeval notary can still be found in England where notaries, under a statute of Henry VIII which is still in force, are appointed by the archbishop of Canterbury. During the early Middle Ages the power to appoint notaries was exercised by the popes and kings and by those to whom such power, under the prevailing feudal institutions, was delegated. The ever increasing assertion of temporal over spiritual power and the concurrent spread of knowledge of writing to classes other than the clergy resulted finally in the secularization of the notarial office. With the exception of England the power of appointment is now exercised by some governmental agency. In the United

States notaries are appointed in each state by the governor—in some states with the advice of his council or the upper branch of the legislature. In the District of Columbia appointments are made by the president of the United States. In France the power is vested in the president of the republic, who acts on the recommendation of the minister of justice. In the German states appointments are made by the minister of justice and the presidents of the higher courts.

The functions of notaries have developed differently in various countries, with the result that the relative importance of the office in the hierarchy of law administration has not always been the same. In most of the civil law countries the notary public is an important official whose cooperation is indispensable in almost every legal transaction of any consequence. In England and in the United States, on the other hand, the duties of the notary are rather perfunctory.

Perhaps in no other country has the notarial office attained the power and dignity which characterize the French notary. He is appointed for life and is irremovable except for breach of his trust. As a curious survival of the old regime, in which the venality of public office was the rule, the French notary has power to devise or sell his office to a successor of his own choice. In order to guarantee the integrity of the office he is forbidden to engage in trade or business or to have any interest therein; he cannot act as counsel or attorney, nor can he hold any office. He is liable for any violation or breach of his duty under a substantial bond held by the government. The notarial corps is organized throughout France similarly to the bar association, and the organization is vested with broad disciplinary powers over its members.

Although he is a public officer, the French notary receives no salary from the state; nor is he entitled to pension upon retirement. He is rewarded for his services by fees which have been fixed by statute since 1808. Nevertheless, the notarial branch appears to be the most remunerative in the French legal profession, because its assistance is requisite in almost every transaction. The statute of 25 Ventôse, year XI, although amended and modified, is still the fundamental charter of the French notarial system. By virtue of this statute notaries are charged with the drafting and authentication of all deeds and contracts to which the parties thereto are either obliged or desirous to give authentic character, such as *attaches to* public documents.

The power thus vested in the notary is very broad both on account of the great number of legal transactions wherein the authentication of the documents is compulsory and because of the probative force implicit in the notarial act. The following are only a few examples: deeds relating to real property, such as conveyances, leases, mortgages and liens; documents concerning inheritance, wills, gifts and inventories and partitions of decedents' estates; parental consents to marriage, marriage contracts; accounts and divisions of estates of minors; acts dealing with the formation of partnerships and corporations; certificates of payment of one quarter of subscribed shares of stocks. Private contracts relating to ordinary business transactions, such as contracts of sale, loans and bailments, may at the discretion of the parties be drawn up and attested by the notary, whereupon they become *actes authentiques*. The notarial attestation covers the certainty of the existence and the date of the transaction; the notary keeps in his archives the original document, a copy of which is always available to any interested party. Copies of such notarial documents are received as evidence in legal proceedings and are not subject to attack except for fraud. They become executory when placed in the hands of the sheriff. The notarial attestation does not consist merely of placing a rubber stamp on statements submitted by the parties but frequently involves the notary's cooperation in their preparation. He often participates in the drafting of the documents in order to avoid technical defects which may result in the nullity of the agreement; he must inquire and satisfy himself concerning the identity and capacity of the parties and the truth of the statements made by them.

The French notary thus appears to exercise what is essentially a non-contentious jurisdiction. His function tends to diminish the necessity of resorting to litigation. He advises parties how to formulate their intent; he enlightens them concerning their rights and obligations; he assists them in drafting their documents so as to prevent uncertainties. By preserving these documents he enables the parties at any time to prove their respective claims. In order to fulfil such diversified functions he must be an expert with a considerable technical knowledge of law and business. In most other civil law countries the notaries perform similar functions; and, while the office of the notary is perhaps not held in the exceptionally high esteem which characterizes it in France, the position and importance

of the French *notariat* is more or less characteristic of the notariates in other civil law countries.

In England and in the United States the office of the notary has little significance today. Some centuries ago, when canon law was equal in importance to common law, he had an exceptional position, as is shown, for instance, by the rule that his testimony was worth that of two ordinary witnesses. As common law became paramount, the powers and influence of the notary gradually diminished; and the institution was received in the United States with such lessened importance. Both in England and in the United States the notarial function consists in the authentication of deeds and the attestation of commercial documents, the taking of depositions and affidavits to be used in judicial proceedings and the protesting of bills of exchange. In connection with his functions the notary is authorized to administer oaths. But, in contrast to France and most of the other civil law countries, he does not take part in the drafting of the documents, which are usually submitted merely for his signature and seal. It may be observed that his position in England is somewhat higher than in the United States. Before being appointed the candidate in England has to serve under a notary for seven or five years, depending upon whether he intends to practise within or outside of London. Most English notaries today are solicitors. In Scotland no person can be a notary unless he is enrolled as a law agent. In the United States, on the other hand, appointment to notary's office is not conditioned on any special training or particular qualifications.

NOTTINGHAM, FIRST EARL OF, HENEGAGE FINCH (1621-82), English judge. Finch was a member of a distinguished legal family. Called to the bar in 1645, he acquired a large practise during the Commonwealth but took no part in politics until the Restoration, when he became

successively solicitor general (1660), attorney general (1670), lord keeper (1673) and Baron Finch of Darenty (1674), lord chancellor (1675) and Earl of Nottingham (1681). He was responsible for the legislation in 1660 which abolished military tenures and from 1673 onward took a prominent part in the attempts to frame a satisfactory statute against frauds. The proposal seems to have originated with him, but Chief Justice North had an almost equal share in drawing the bill which finally became the statute of frauds in 1677. But his greatest claim to fame is his work in the Court of Chancery. He brought to equity a thorough knowledge of common law and studied chancery doctrine with the same methodical spirit which he had applied in student days to the common law. For his own private use he compiled treatises in the decadent law French of the common lawyers, wherein he sought general principles which would knit together the mass of largely unrelated chancery decisions. He further declared that the "conscience" which swayed the chancellor was no longer his personal or private sense of right but the "civil conscience" embodied in the settled principles of equity. In his hands therefore equity became a system with established rules which for the future were considered as binding in the Court of Chancery. He also did much to lay the foundation of the modern law of mortgages, and in the Duke of Norfolk's Case he established the modern rule against perpetuities. In matters of constitutional law he was a royalist and a fairly sound historian of the law of the prerogative.

NOVALIS (Friedrich von Hardenberg) (1772-1801), German romantic poet and philosopher. Novalis' significance in the history of the romantic movement consists mainly in the fact that he represents the transition stage between the early and more purely aesthetic romanticism and the later political romanticism. Traditionalism, the organismic view of the state, the ideal of a paternalistic and authoritarian rule, the glorification of the Middle Ages, the emphasis on the religious factor in civilization and the regeneration of Catholicism—all these ideas characteristic of the later romanticists, such as Baader, Adam Müller and Friedrich Schlegel, are found in embryo in the fragmentary writings

of Novalis. He was the first of the German romanticists to turn against the French Revolution, attacking the Enlightenment and its mechanistic, utilitarian view of the state and its principles of natural rights, equality and representative democracy. Most of his ideas are not original; they hark back to the influences of Zinzendorf and the Pietists, to Herder, Burke and Schleiermacher. But Novalis did give a political content to the more purely aesthetic and religious ideas of the early German romanticists. In his philosophy of history he went beyond Herder in definitely disassociating the Middle Ages from the period of classical antiquity and in emphasizing the Christian character of the mediaeval period. In his political philosophy he was the first to formulate the organismic view of the state. He called for a greater and more intensive political activism on the part of the citizens and regarded the state as the incarnation not only of the political but also of the cultural and religious life of the individual. In the paternalistic rule of Frederick William III and Louise of Prussia he saw a concrete realization of his political ideals.

Novalis' profound influence on German thought is to be attributed not so much to the effectiveness of his ideas as to the poetic form in which he voiced them and even more to the romantic halo which developed around his personality. His youthful precocity and his all embracing interests—often nothing more than dilettantism—his tragic love affair with Sophie, his own premature death at the age of twenty-nine, all contributed to make a legend of his personality and to set him up in the eyes of his contemporaries as the concrete exemplification of the romantic ideal of genius.

NOVIKOV, YAKOV ALEXANDROVICH (Jacques Novicow) (1849-1912), Russian-French sociologist and pacifist. Novikov adhered to the school of sociology which, following Spencer, conceived of society after the pattern of the human organism. He defended the bio-organic conception of society in his *La théorie organique des sociétés, défense de l'organicisme* (Paris 1899) and in *Conscience et volonté sociales* (Paris 1897) he compared to the nervous system of an organism the élite, whom he regarded as the initiators of ideas and sentiments which control and guide the behavior of the social organism. He held the practise of violence for the achievements of particularistic ends to be the destructive agent which prevents the healthy and integrated functioning of society; thus poverty was to him the result of violence in the form of brigandage and spoliation (*Le problème de la misère et les phénomènes économiques naturels*, Paris 1908). In his major work, *Les luttes entre sociétés humaines et leur phases successives* (Paris 1893, 2nd ed. 1896), Novikov attempted to show that while struggle is universal, violence is not its necessary concomitant; this led him to criticize sharply the narrow conception of the struggle for existence as formulated by the social Darwinians (*La critique du darwinisme social*, Paris 1910). He distinguished four levels upon which the struggle of human beings takes place, three of which, the physiological, the economic and the political, imply violence in some form; the fourth is the intellectual level, on which struggle assumes the character of competition without bloodshed, spoliation or extermination of fellow men. He set forth the view that social evolution is development toward the elimination of violence from human relations by a process whereby struggle is gradually raised to the intellectual level. The main task of the social scientist he considered to be the promotion of this end, and he therefore devoted the major share of his writings to propaganda for a society in which violence would have no place. He rejected socialism and collectivism as coercive and proposed in vague terms a political reorganization which would lead to a federation of states and to the establishment of universal justice and harmony. Novikov failed to go beyond generalities in the expression of his strong emotional reactions against force; he did not analyze or advocate concrete, practical measures for attaining a society free from violence.

NUISANCE. Although nuisances, real and fancied, have plagued society since time immemorial, it is difficult if not impossible precisely to define the term. Changing social conditions have relegated some nuisances to the realm of the archaic and vested others with importance, so that each case must be considered more or less by itself. Furthermore an attempt to classify nuisances is, as suggested by Judge Cooley, "almost equivalent to an attempt to classify the infinite variety of ways in which one may be annoyed or impeded in the enjoyment of his rights" (*A Treatise on the Law of Torts*, vol. iii, sect. 401).

Blackstone defined a nuisance as "whatsoever unlawfully annoys or doth damage to another," and also as "anything that worketh hurt, inconvenience, or damage" (*Commentaries* III, 5, 216). In legal parlance the term is now conceded to extend to "everything that endangers life or health, gives offense to the senses, violates the laws of decency, or obstructs the reasonable and comfortable use of property" (*Ruling Case Law*, vol. xx, p. 380). Many more complex definitions have been offered by legal writers, and the courts have enumerated literally hundreds of specific actions and conditions which may constitute nuisances. A nuisance is at least readily distinguishable from a trespass, which involves a direct injury to the property rights of another person.

A nuisance may be either public or private. Public nuisances, those affecting the people as a whole, are obviously of greater social significance than the many private nuisances, which concern only the affairs of individuals. "Common nuisances," wrote Blackstone, "are a species of offenses against the public order and economical regimen of the state; being either the doing of a thing to the annoyance of all the king's subjects, or the neglecting to do a thing which the common good requires" (*Commentaries* IV, 166). Motive and intent play no part in the creation and maintenance of nuisances, but negligence may be a factor. A public nuisance must cause special and peculiar damage to an individual in order to entitle him to personal redress. The modern rule against nuisance revolves around the ancient maxim, *sic utere tuo ut alienum non laedas*, literally, "so use your own as not to injure others." Failure to comply with this rule authorizes an individual who is damaged thereby

to invoke the appropriate remedies to abate or prevent the nuisance, or empowers the state itself to take suitable action in behalf of its citizens.

In the mediaeval English law the chief remedy available against nuisances was the assize of nuisance, which afforded the remedies of both abatement and damages. Supplementary to the great assize of novel disseisin, it lay, however, only in favor of freeholders. Another much more cumbersome remedy, especially since it was subject to great delay, was also available in the mediaeval law; this was the writ of right, *quod permittat prosternere*, which had to be brought when land upon which a nuisance was being maintained was alienated. Both of these remedies were obsolete in the time of Blackstone but were not formally abolished until the enactment of the Real Property Limitation Act [3 & 4 Will. IV (1833), c. 27, sect. 36].

The common law, however, also permitted the summary abatement of all nuisances. Not only could the state take this action, but an aggrieved individual might do so after proper notice. Both might have to justify their actions later before the courts. This right of summary abatement still exists and is frequently utilized by health officials when they seize or destroy infected materials which endanger the public health.

Although the Fourteenth Amendment to the Constitution of the United States prohibits any state from depriving persons of life, liberty or property without due process of law, the right of summary abatement was not relinquished by the people. The Supreme Court has frequently upheld this procedure, especially when the property involved has been of trifling value [*Lawton v. Steele*, 152 U. S. 133 (1894)].

A heritage from the common law is the distinction between nuisances *per se* and nuisances *per accidens*. The former comprise all those conditions and acts which by their very nature are nuisances, such as a house of prostitution or a case of smallpox. The latter include only those which are not by nature nuisances but which may become such by virtue of their localities, surroundings or mode of operation. Noise and smoke are not nuisances *per se*, but under certain conditions they may be both offensive and harmful.

To these two types of nuisance may be added a third, the nuisance concerning which there may be an honest difference of opinion in impartial minds. Many elements, including a nice

adjustment between public and private convenience, are involved in the adjudication of such nuisances. Relying on the principle "the greatest good of the greatest number," legislatures and courts must deal with these matters in a prudent manner. Thus detriment to the aesthetic ideals of individuals is not sufficient cause for action.

Modern statutes have of course modified the common law to some extent by denouncing as nuisances certain acts and conditions which were not so by custom or ancient law and exempting from this category others which were. Such action is sanctioned by social progress, but American courts retain the prerogative of reviewing legislative action in this as in other respects. On the whole the judiciary has been liberal in sustaining the acts of legislatures against nuisances, but it has been much more stringent in considering municipal ordinances and regulations on this subject and in scrutinizing the findings and actions of executive officials, such as health authorities. It is a well established principle that the state may delegate powers of nuisance control to its political agents, but this ministerial power must be exercised in a reasonable manner calculated to promote the general welfare. In continental law the power of local officials is more complete and final in these matters.

Although nuisance control was once the chief activity of health officials and almost the foundation of sanitary administration, public health authorities are at present concerned primarily with persons rather than with things, and they tend to assign a minor role to nuisances as factors in public health protection. It is recognized of course that certain diseases may be spread by polluted water and contaminated food, by insects and animals and by the inmates of brothels; and it is conceded that health may be affected by unsanitary housing, adverse working conditions and various other environmental disadvantages which are the accompaniments of urban and sometimes of rural life. Odors, for example, may be nuisances, but there is no scientific evidence to prove that such annoyances are in any way detrimental to health. Many other conditions may be nuisances from the standpoint of morals, decency, comfort, convenience and safety of the public; but they are seldom health nuisances, and action upon them serves only to divert public health authorities from their more important duties of communicable disease control, maternal, child and school hygiene, public health nursing, public health engineering, the

collection of vital statistics and popular health instruction.

Since every public nuisance was also a crime at common law, one of the remedies employed was that of indictment. Modern statutes more often provide for a fine or even imprisonment for persons found guilty of maintaining nuisances, with the result that indictments at common law are now unusual. Actions for damages also may be brought in nuisance cases. Although damages may be allowable for every day that a nuisance is continued, this legal remedy is often inadequate since it substitutes compensation for elimination of a possibly dangerous condition, and it may also lead to a multiplicity of suits. In cases of public or private nuisance a more frequent remedy therefore has been the equitable one of abatement by injunction. Such action is as readily taken against a municipal corporation which creates a nuisance as against an individual or a private corporation.

As part of the police power nuisance control is inherently the function of each American state. The activities of the federal government are limited to the prevention of the entry of actual and potential nuisances into the United States and their avoidance in interstate commerce. In exceptional cases, however, the federal as well as the state courts have intervened to abate nuisances. The United States Supreme Court also has taken jurisdiction in suits brought by states under its constitutional power to adjudicate controversies between states.

The occurrence of nuisances in foreign countries sufficiently near international boundaries to cause injury to citizens of other nations calls for action by diplomacy and treaty in accordance with the principles of international law. One of the articles of the Covenant of the League of Nations empowers the League to take steps in matters of international concern for the prevention and control of disease; the exercise of this function has consisted mainly in the interchange of information, the formulation of standards and the investigation and reporting of diseases and epidemics, but not in the abatement of local nuisances.

NULLIFICATION. See STATES' RIGHTS.

NÚÑEZ, RAFAEL (1825-94), Colombian statesman. After receiving the doctorate in jurisprudence and political science Núñez became active in politics and by 1882 he had filled various local and national offices, including a two-year term as president of the republic. During this period he had been allied with the federalistic, anticlerical Liberals, who had dominated the country most of the time, and in his earlier years he had even leaned strongly toward socialism.

But the political turbulence and general backwardness which characterized the nation under Liberal control brought about a revolutionary change in his political principles; and between 1881 and 1884, in a long series of press articles diagnosing national ills and prescribing remedies, he laid the foundations for a new governmental system. In 1884, when again in the presidential office, he led in the formation of the Nationalist party, which restored conservative rule to Colombia for nearly a half century (1886-1930). A convention of adherents to the new party in 1886 adopted a conservative-centralist constitution in harmony with Núñez' changed political philosophy. This provided for restoration of the Roman Catholic church to its old

flavored position and gave it control of national education. But freedom of worship was promised to all except when it should prove contrary to law and Christian morals. The aim was to foster national solidarity through church unity and discipline of character through religious teaching. Núñez hoped also to divert interest from soldiering and professional politics by fostering agriculture and industry. He remained president until his death. His regime was marked by governmental stability and decrease in corruption; but it did not effect the progress expected.

NURSERIES, DAY. *See* DAY NURSERY.

NURSERY SCHOOLS. *See* PRESCHOOL EDUCATION.

NURSING. Nursing care dates from earliest known society when women dressed the wounds and soothed the fevers of members of their families or prepared healing potions from herbs and medicinal plants. Primitive religions, assigning to evil spirits the mysterious origin of disease, set up their own system of therapy, a departure from democratic, undisciplined household practices. As early as the twelfth century B.C. there were Greek temples where ill persons, under religious guidance, carried out a regime of diet, rest and baths. India, however, was the first country to recognize nursing as a separate calling, usually for men, and to pay salaries in publicly supported hospitals for their services. According to an early Sanskrit medical treatise: "The Physician, the Drugs, the Nurse and the Patient constitute an aggregate of four. Of what virtues each of these should be possessed so as to become causes for the cure of disease should be known." Among other ancient civilizations the Egyptians contributed a knowledge of drugs, the Jews some excellent laws for public and personal hygiene and the Romans their famous

examples of sanitary engineering. Nursing as a branch of modern medicine traces some of its services to each of these sources.

Early Christianity brought a new spirit of charity and compassion into human relationships. Both women and men, Phebe perhaps the best known, were members of the diaconate whose duties were to visit the sick, to feed the hungry, to teach the young and to protect the aged. Ever since the first century A.D. there has been an unbroken succession of women nurses in western civilization, the value of their services fluctuating not so much with the rise and fall of medical knowledge as with the social status of women and the freedom granted them for self-directed work outside their own homes. As the church increased in wealth and complexity of organization the unhampered zeal of the early deaconesses or parish nurses inevitably stiffened into patterned rules of conduct. Monasteries were built with accommodations for the sick poor; but the monks and nuns owed their first allegiance to the rites of the church, not to their patients' needs. The Augustinian Sisters, nursing in the Hôtel-Dieu of Paris from 651 until 1908, have the longest history of these religious nursing orders. High born abbesses, for example, Radegonde in the sixth century and Hildegard in the twelfth, might study all the medical knowledge available to their day; but the rank and file of nursing nuns attended to the laundry and other menial tasks, prepared the meals and prayed beside the dying without benefit of even a modicum of scientific training. Nursing became a disagreeable drudgery performed for an ultimate reward in heaven. Although doubtless there were many unknown saints whose lives radiated a spiritual grace akin to that of St. Francis as he worked among the lepers or St. Elizabeth descending from her castle to care for her sick peasants, nevertheless nursing was for the most part regarded as a penance, not a profession.

The crusades stimulated nursing organization, as wars generally do. Semireligious military orders, like the Knights Hospitallers of St. John of Jerusalem, built hospitals along the route from England to Palestine, equally famous for the beauty of their architecture and for the wealth and aristocracy of the men and women who served in them as nurses. The traditional strict discipline of nurses' training had its origin in this long association of nursing with authoritative regimes of mediaeval religious and military life. Here and there small groups of women

refused to submerge individual intelligence and private property in these institutions. The Bèguines of Belgium are the most famous of the secular nursing orders, living unclioistered under their own rules from the twelfth century to the present. The rise of humanism with its interest in science and its defiance of ecclesiastical formalism encouraged these free groups. St. Vincent de Paul founded the Sisters of Charity in 1633 as an unclioistered visiting nursing order. The Protestant Reformation and the expansion of wealth based on commerce and manufactures sapped power from the feudal church and transferred the care of the sick largely to tax supported hospitals. A new type of nurse appeared, a paid servant, preferably the cheapest the city officials could find. Not infrequently women inmates of workhouses and penal institutions were obliged to care for the sick poor. Without religious inspiration to refine drudgery, without education to appreciate the beginnings of modern medical science, without sufficient wages or leisure to maintain a decent existence, these untrained nurses were pitiable and unrespected creatures. In some countries they still exist.

As a part of the humanitarian reforms to which the industrial revolution gave rise, concerted efforts were made during the nineteenth century to improve nursing and hospital conditions. Pioneers in this movement were Pastor Fliedner and his wife of Kaiserswerth, Germany. Attempting to meet the social needs of their impoverished parish, they revived the forgotten order of deaconesses and in 1836 planned a training course with emphasis on nursing. There were several revolutionary features in this course: obligatory entrance certificates of health, education and good character; five years of graded supervised training; an allowance of spending money; recreation periods as part of the program; and, most important in principle, the appointment of a matron with complete authority over the work of the pupils.

Among the visitors attracted by the deserved reputation of the Kaiserswerth school was Florence Nightingale, who became convinced that nursing offered a long neglected field for the activities of trained gentlewomen. To her modern professional nursing owes the first enunciation of its basic principles: that nursing should be approached as a science and practised as an art, with devotion and intelligence, not sentimentally as an outlet for emotion or penance for sin; and that in any institution engaging nurses a woman superintendent should be solely re-

sponsible for their activities and discipline. In 1860 Miss Nightingale founded a school of nursing at St. Thomas's Hospital, London, where emphasis was placed upon cleanliness and sanitation, a knowledge of the scientific reason for every nursing procedure combined with deftness in its performance, and a discriminating observation of the patient's condition. Immediately the school attracted women of energy and intelligence, whose aspirations had been stirred by the current feminist literature but who had had little opportunity to exercise their abilities. On completion of a crowded year of theory and supervised practise these women went out to revolutionize conditions in the filthy wards of overcrowded public hospitals and to establish new schools of nursing based on the Nightingale principles.

In the United States experiences of influential citizens on the Sanitary Commission during the Civil War resulted in a demand for improvement in hospitals. Schools of nursing were established almost simultaneously in several cities, among the earliest being the New England Hospital for Women and Children in Roxbury in 1872, where Linda Richards became the first American graduate nurse. The first superintendents of nurses at Bellevue Hospital in New York City and the Philadelphia General Hospital were graduates of the Nightingale School in London.

With the advance in medical science and the development of hospitalization came increased demands on nursing skill, requiring an expansion of the original single year of training into three or more years. The Johns Hopkins School of Nursing led in raising academic standards, admitting only high school graduates as pupils, charging tuition fees and paying salaries to lecturers. Courses in hospital administration and public health were introduced into Teachers College, Columbia University, as early as 1899. Comfortably furnished nurses' homes replaced the unsanitary cubicles attached to hospital wards which had previously housed pupils. Uniforms were adopted, adding dignity to both pupil and graduate nurse. The new preventive medicine led some nurses to work in schools and factories, city slums and country districts. Perhaps because of the pioneer quality of their activities the first graduate nurses were intensely individualistic. As the number of schools increased, however, with widely varying standards of work and ethics, the value of nurses' associations based on recognized efficiency became apparent. School alumnae associations were

formed, then societies of training school superintendents and finally national organizations of graduate nurses, entirely self-governing in the United States, but with physicians as influential members in England. The solidarity resulting from organization under single minded leadership made possible an early acceptance of the principle of state examination and licensing of nurses in the United States. In other countries where nursing organizations have been guided by medical or lay members the struggle for state registration and higher academic and social status has been prolonged. In both the United States and Great Britain nurses belonging to religious orders have usually joined the national associations and supported the demands for state registration.

The Red Cross, founded in 1863 as an international organization to care for the victims of war, has been an important factor in nursing history. In Europe it maintains many nursing schools and hospitals of varying standards, usually dominated by committees of conservative aristocrats. The American Red Cross in addition to its wartime services has supported rural public health nursing and conducted short popular courses in home nursing.

There were in 1900 in the United States 11,804 graduate nurses, or 1 to every 6438 persons; by 1930 the number had risen to 294,189, or 1 to every 417 persons, with an annually increasing number of pupils in the 1802 accredited training schools. Such a ratio is disproportionate to the actual nursing needs of the population and to the amount of money available for nursing services. Four divisions of the nursing field are open to these graduates: private duty, institutional nursing, public health work and teaching. In the case of the second and third divisions teaching is often required in addition to administrative responsibilities. The great majority of nurses continue to enter private duty, although this field is already far too overcrowded and offers irregular employment and unsatisfactory living conditions. The average private duty nurse obtains employment for only a few months each year, serves twelve hours of day or night duty whether in a private home or in a hospital and receives fees of \$6 or \$7 per day. Institutional nursing includes a wide range of activities, from routine care of patients in the public wards of a hospital or charge over an orphanage infirmary to the complex responsibilities of a hospital superintendent who is also head of a training school. Hours of duty may be continu-

ous day and night or may be restricted to eight-hour periods. Salaries range from about \$1000 a year with meager maintenance to \$4000 a year with comfortable apartment and automobile. The demand for public health nurses has increased rapidly since the medical statistics of the World War revealed the nation's health deficiencies. In 1931 there were 15,865 graduate nurses with public health training, not including about 3000 industrial nurses. Sixty percent of these nurses were employed in official departments, and the number is increasing steadily. Salaries rise from \$1500 a year for staff duty to \$2400 as the median for executives, with a few individuals receiving \$5000 or more. Opportunity for normal living conditions as a result of the usual seven or eight-hour working day, and for stimulating professional associations, distinguishes this field of nursing.

Retirement pensions and unemployment insurance for nurses in the United States and Canada are available only in the case of a few private or philanthropic agencies. Outside of the military and naval nursing service no government system as yet exists. In European countries, on the contrary, such as Germany, where old age pensions are provided by law, nurses are pensioned as are all classes of wage earners.

In the United States there are 15 accredited training schools for men and about 2000 graduate male nurses, most of whom are engaged for cases of mental or venereal disease or in hazardous industrial work and in prisons. They are more numerous in European countries and in the Orient, where social customs often prevent young women from performance of routine nursing care of men patients; in the Philippines men are trained in American hospital schools for public health nursing in remote, unsettled districts. Male nurses are especially well adapted to psychiatric nursing, which during the past decade has become increasingly important in the prevention and early treatment of mental disorders. In 1927 the International Council of Nurses formed a standing committee to promote this branch of the profession. In all countries there are perhaps 14,000 male nurses trained in religious brotherhoods or in secular schools.

Of practical nurses and attendants with some hospital experience there are about 154,000 in the United States, most of them finding employment among families who cannot afford a registered nurse but who, because of chronic illness or other unusual circumstance, require constant nursing attendance. An effort to solve this prob-

lem has recently been made through the development of "visiting housekeepers" who combine the duties of home management with nursing. The wider use of practical nurses in the care of chronic illness and in certain other cases is probably advisable, but waits upon the standardization of their training.

Some adjustment in the numbers and distribution of nurses and in allocation of the cost of nursing care is imminent. Although there are no reliable statistics, it is obvious that large urban centers have too many nurses and rural areas too few, while everywhere the class best able to pay for nursing care requires the least amount of it. Nurses supported by public taxes are usually connected with official health departments, practising only preventive medicine; private philanthropy and subsidies from the life insurance companies have provided certain limited districts with trained bedside nursing for people unable to pay the full fee of a trained nurse, but their program is inadequate as a national system. To correct these unsatisfactory conditions experiments are now in process with group nursing of hospital private room patients and with hourly nursing in the home, the patient paying the full cost of his share of the nurse's time. The School of Nursing at Yale University has undertaken a scientific study of the requirements in time, training and equipment of fundamental nursing procedures as bases for the first accurate computation of the cost of nursing care and in anticipation of an economic readjustment of nursing service in terms of community rather than individual needs. The increasing interest in compulsory health insurance as well as certain trends in the public health movement points to a time when nursing, whether preventive or therapeutic, will be considered an essential public service to be provided as universally as elementary education.

Public health nursing has become a dynamic expression of modern humanitarianism. It has been defined by the National Organization for Public Health Nursing as "an organized community service rendered by graduate nurses to individuals and families. It includes the interpretation of medical, sanitary and social procedures for the correction of defects, prevention of disease, and the promotion of health, and may include skilled care of the sick in their homes." This service may well have been envisioned by Florence Nightingale for what she termed "health nurses" as distinct from the "sick nurses" of her day. She communicated some-

thing of her ideals to William Rathbone of Liverpool, who financed as a charity the first secular visiting nurses' association in 1859. For many decades, however, while the number of associations grew in England and America, the aim of the nurses was to reproduce hospital conditions as nearly as possible in the homes of their patients. A mystery enshrouded the nurse's ministrations, in which the patient's family had no share. When in 1893 Lillian Wald went to live among her patients on New York's East Side this aloofness was doomed. The spirit of the nurses' settlement founded by Miss Wald carried the interest of the visiting nurse beyond the care of one individual to the fortunes, social and sanitary, of the entire family and its neighborhood. At about the same period the emphasis of the public health movement was shifting from ordinances and compulsion to the prevention of disease by educational methods, a program into which the nurse fitted admirably. While giving skilled bedside care she could translate into simple words the discoveries of long years of research and suggest their household application. At the same time she could learn the health habits of all members of the family, the emotional abnormalities as well as the social and economic backgrounds which so powerfully affect a family's health. Wherever she went morbidity and mortality rates fell in sharper curve than elsewhere and the value of a public health program to the community was clearly demonstrated.

Many different services in addition to bedside care are now included in public health nursing. The school nurse assists the doctor in the medical examination of children, visits the parents to urge correction of physical defects, cooperates with the teacher in planning health education programs and renders first aid in accidents; the industrial nurse brings almost the same service to the employees of a factory or industry; nurses help to conduct dispensaries whether publicly or privately financed; the families of patients suffering from acute contagious diseases, tuberculosis or venereal disease receive from nurses special instruction and sometimes assistance in nursing care; pregnancy and early infancy, even if normal, require continuous sympathetic supervision, which the physician usually delegates to the nurse. In every case the principles of healthful living must be taught with special stress upon their relation to sanitation, nutrition and mental and social hygiene. The employment of nurses with special training for each type of

service was once recommended, but careful study has proved that a generalized service is more economical and more efficient. An administrative ideal would allot a nursing organization to each community, urban or rural, with one nurse making the necessary visits in each small district.

In the United States since 1912 the National Organization for Public Health Nursing has been largely responsible for the unity and progress in this branch of nursing. It publishes a monthly magazine, helps to support an employment bureau, maintains a small staff of research workers and traveling consultants and has drawn up qualifications for workers and standards of technique which tend to improve the quality of public health nursing.

The rational development of nursing education has been complicated by its origin as an apprenticeship in hospital wards. When the laboratory and aseptic technique became essential factors in diagnosis and treatment of disease, hospitalization rapidly increased both in extent and in value to the patient. With this advance more nurses were needed to care for the number of new nursing procedures as well as for the greater number of patients. The cost of this increased staff was parried, satisfactorily to the hospital directors, through use of additional pupil nurses. Responsibility for maintaining a school based on sound educational principles was not keenly felt. Low entrance requirements, meager academic instruction, inadequate supervision of practical work and a tempting stipend to pupils inevitably resulted in an oversupply of poorly trained graduates. Apportionment of the time of the student too often depended, not on the experience she would need later in meeting the nursing demands of the community but on the immediate requirements of the hospital; an undue proportion of her time usually went to the surgical department and to unsupervised night duty. The pioneer stage of training schools is, however, gradually coming to an end with the establishment of trained nursing as a profession and the demonstration of its value to the medical profession and to the general public. The hospital of the future will probably employ more graduate general duty nurses and more trained attendants, while the student nurses will pay tuition fees in endowed professional schools of nursing affiliated with hospitals offering adequate educational experience but no longer dictating the hours and subjects of the curriculum.

Within recent years classroom teaching has

increased in amount and improved in quality, while everywhere the proportion of pupil nurses with high school diplomas has risen. Three years is the usual period of training in the main branches of nursing—medical, surgical, obstetrical and pediatric—with growing emphasis upon experience in out-patient clinics and social service departments. At the end of this period in an accredited hospital school the nurse is eligible for state examination and licensing. An additional nine months' course in visiting nursing, community organization and family case work is customarily required for the certificate in public health nursing. At the present time seventy-five American colleges or universities give instruction in nursing, ranging from scattered lectures for graduate nurses to a full five years' course leading to an academic degree.

Among the organizations whose object is to improve the status of the nursing profession the American Nurses Association has been particularly active. Founded in 1896 and comprising 103,741 members in 1932, it publishes the *American Journal of Nursing*, maintains a relief fund and several educational scholarships, directs research and supports legislation favorable to nursing and public health. The National League of Nursing Education, composed of teachers and supervisors of nursing, has been an important force in educational progress among nurses in the United States. The International Council of Nurses, with headquarters in Geneva, promotes friendliness and a standard of professional self-government among nurses of all countries. Another factor in international cooperation is the League of Red Cross Societies, organized after the World War to promote peacetime humanitarian activities and composed in 1931 of the Red Cross societies of more than fifty nations. The chief work of its nursing division is to found training schools in countries where they do not exist and to promote the public health movement. In furtherance of the latter aim an international nursing center has been established in London in cooperation with British education and nursing authorities. Each year scholarships are granted to qualified nurses from various countries to pursue advanced public health training and courses in nursing school organization and administration.

The more conservative social traditions of European and Asiatic countries have retarded the development of self-governing nursing groups among women. Even Florence Nightingale thought in strictly individualistic terms and

added her influence to the forces in England which prevented state registration of nurses until 1919, although almost three decades earlier the British Nurses Association had been the first group of professional women to obtain a royal charter of organization. In general, however, the status of nursing in all English speaking countries is similar to that in the United States. The technical nursing services in the public health field have been centralized and standardized more fully in England than in America. The Queen Victoria Jubilee Institute for Nurses, as an integral part of Great Britain's Ministry of Health, trains and supervises all visiting nurses; it also supervises rural midwives, many of whom are nurses who have taken the officially approved midwifery course in addition to their own training. British enterprise is largely responsible for the development of modern hospitals with training facilities for nurses in Australia, New Zealand and South Africa, most of which are patterned on the Nightingale system. Under the British mandate in Palestine government training schools have been opened at Jerusalem and Haifa and in the municipal hospitals of Jaffa and Nablus.

Examples of all types of mediaeval and modern nursing organizations exist in Germany. The Catholic church continues to train both monks and nuns for its traditional nursing service. Similarly, Protestant deaconesses, trained as nurses, remain under direct supervision of the clergy in all of their subsequent activities, while nurses affiliated with Red Cross societies become servants of a nationalistic state. The graduates of all training schools, whether under the control of church or state, are forbidden membership in independent nursing organizations. A few individuals have defied social and religious authority by withdrawing from the organizations which trained them and have formed a voluntary professional association, patterned on those in England and America, but its future is still uncertain. Recently several municipal hospitals with training schools for nurses have been opened, but their number is as yet too small to exert any appreciable influence. In Germany in 1930 there were 451 recognized schools of nursing and approximately 60,000 registered nurses.

Conditions in the Scandinavian countries show a similar lack of standards and unity, although of late there has been considerable improvement in nursing education. In Sweden, where many of the early leaders received their

training at the Nightingale School, the deaconess orders and the Red Cross have been active in coordinating training schools with hospitals. The Danish Council of Nurses and the Norwegian Nurses Association have been important forces in raising the status of the profession in their respective countries through emphasis upon a three years' training course and recognition of only such schools as provide this minimum. Independent state hospitals with facilities for nurses' training have been established in both Finland and Iceland since 1930. In all the Scandinavian countries notable progress has been made in the state registration of midwives, most of whom are trained nurses supported by the government to serve in rural communities. According to statistics for 1930 there were approximately 18,000 registered nurses in the Scandinavian countries.

When the French government expelled religious orders, nursing in the larger city hospitals was given over to untrained women, poorly paid and sometimes dissolute, many of whom still remain on duty. In 1901 Dr. Anna Hamilton started a reform by introducing Nightingale methods into the Bordeaux Hospital. In 1907 the Salpêtrière in Paris instituted a two years' training course for nurses in an effort to improve conditions in the municipal hospitals. Since the World War, when English and American nursing became common in France, the Ministry of Health has encouraged modern training and issues official state diplomas to qualified nurses. In 1931 there were 80 recognized schools of nursing in France, 25 directed by religious orders and 55 under secular auspices, of which nearly 30 were controlled by the Red Cross. Graduate nurses in 1930 numbered 22,500.

In Italy, Spain and Latin America nursing is still considered incompatible with the sheltered life of middle and upper class young women and professional standards are accordingly low. In the case of Cuba and South America some advance from this traditional conservatism has been made by modern schools recently opened under American influence. Hospitals coordinated with training schools have been established under American direction in the Philippines, Hawaii and Porto Rico. Modern nursing has been undertaken in Brazil under the auspices of the National Department of Health and also in Chile. In the latter country three state training schools have been opened, one in connection with the University of Chile at Santiago.

In the Slavic and Balkan countries organized

health work was unknown until recently. Stirred by the suffering revealed during the World War, humanitarian and welfare agencies in several of the newly created states, assisted by American philanthropy, have launched active health campaigns, in which the modernization of the nursing profession holds an important place. The educational services of the American public health nurse have been utilized in several of these countries after experiments with inadequately trained health visitors. Today Poland, Czechoslovakia, Bulgaria, Yugoslavia, Greece and Turkey all have at least one modern school of nursing affording thorough hospital as well as public health training. Similarly at the Hadassah School in Jerusalem training for nurses has been patterned after the American system. In Albania, Hungary and Rumania the Red Cross has been largely responsible for the establishment of nurses' training schools.

In recent centuries the indigenous cultures of Asia have given little encouragement to social service or welfare activities. The foreign missionary schools were the first to train native men and women nurses in China and India; but disturbed political conditions in these countries, coupled with racial and religious prejudices and a low educational level among candidates for training, have prevented progress in organization and standards. In 1886 under the auspices of the American Board of Missions Linda Richards introduced modern nursing into Japan, where it has been enthusiastically developed as a patriotic service by the Japanese Red Cross. Numerous training schools offering three-year courses have been opened and there are now more than 50,000 graduate registered nurses in Japan.

In Russia before the revolution modern nursing education was unknown, although a few religious orders provided nursing service and a Red Cross Society offered a short preparation for army nursing. Soviet Russia is now developing a system of state medicine in which nurses have a recognized position, both in institutional and in public health work. They are trained entirely by doctors, with enthusiasm and patience but without as yet any definite standardization of nursing technique. Self-governing nursing organizations are impossible, as are self-governing medical organizations, since all medical personnel, including physicians, nurses, hospital attendants, pharmacists, dentists and midwives belong to one general medical union. Emphasis is placed on collective effort for the

welfare of the institution rather than on separate professional advancement.

As a phase of the emergence of women into full social and economic freedom, the struggle of nurses in all countries for acknowledged professional rank has significance. To gain recognition for this ideal of an independent profession nurses are, however, obliged to overcome many entrenched traditions: the notion that a nurse's life should be sacrificial, rewarded by other than worldly means; the old fashioned physician's belief that the hospital servant is the best type of nurse and that nursing, if advanced to a profession, would compete with medicine; the war-time attitude implying that any woman can achieve as much through patriotic ardor and tenderness as through disciplined hospital training; the idea that a nurse's duties are beneath the dignity of a well educated woman; and, finally, the lack of really professional standards in almost all nurses' training schools. Experience has shown that these obstacles can to a considerable extent be overcome through the provision of legal safeguards to promote efficiency in the profession and to protect the community against ignorance or incompetence on the part of its practitioners. State control of nursing has gradually come to be accepted in principle and at the present time exists in more than thirty countries. Although its form varies under different governments, certain provisions are customary: the issuance of state licenses or certificates, usually upon examination, to qualified nurses; requirements as to standard curriculum and recognition of schools providing such training; a minimum of previous education requisite for admission to these schools; and systematic inspection of all hospitals and nursing schools. Such supervision on the part of the state is a link in the increasing government participation in health and medical work and tends toward a more effective social use of nursing service. In addition to the fulfilment of legal requirements, however, the active voluntary efforts of nurses through independent professional associations will continue to be an important factor in the integration of nursing in a community social service program.

NUTRITION. Primitive man in a favorable environment in which a variety of foods existed in unrestricted quantities had no serious problems relating to diet; he could rely solely upon his appetite as a guide to nutritive well being. To the grains, grasses and plants supplied for his diet by nature he added meat through the practise of hunting and the cultivation of domestic herds. When, however, the population increased to the point where migration became necessary, certain factors were introduced which exerted a direct influence upon the natural food resources hitherto serving as the major determinant of the diet of primitive man. With the change from a uniformly warm climate to the alternating seasons of the temperate zones came the development of agriculture; when conditions were favorable food was produced to be consumed at a later time, and there arose the problems of conservation and of the selection of food and crops best suited to those conditions. Migration was not halted by geography and climate, and even the arctic regions acquired a population which adapted the indigenous flora and fauna to its dietary needs. In response to this shift in environmental conditions populations altered their personal characteristics, with the result that races of men more or less distinctive in physique and customs were evolved. The factors of climate, geography and race have exerted an important influence upon human food habits.

The seriousness of the problem of nutrition and the effects of inadequate diet are cogently illustrated in connection with the forced dietary restriction incident to mass movements of individuals. Historical records show that scurvy, a nutritional deficiency disease, was usually present during long journeys by armies or trade expeditions as well as among polar explorers and sailors while on long sea voyages. This malady and beriberi, another dietary deficiency disease, have repeatedly occurred on land when for some reason the diet was too strictly limited, as, for example, in a community suffering from the failure of staple crops or from food shortage in time of war or economic crisis, or in prisons and other public institutions when those in charge provided the inmates with inadequate rations.

In modern times economic factors have played an important part in bringing about a change in the character of diet. Almost half of the food energy of a nation is obtained from cereals. When the methods of preparing cereals involved little more than mechanical grinding, the resulting product provided many of the essentials of an adequate balanced ration. With the newer trends in the manufacture of certain cereal foods methods of treatment designed primarily to improve the appearance and to facilitate preservation and convenient distribution were introduced. As a consequence the balance of nutrients in the resulting product has frequently been so changed that some of the recognized valuable attributes of this class of foods have been lost. Thus the keeping quality of most ground grain is markedly improved by removing the embryo, or germ, but when this is done valuable salts and vitamins are eliminated. The removal of the bran from cereal preparations improves their appearance but alters the nutritive value. On the other hand, the problem of providing an adequate ration under modern conditions is greatly facilitated by the introduction and perfection of methods of drying such articles as milk and fruits, by the freezing of meats, fruits and vegetables and by the improved methods of commercial canning. Newer extensions of rapid transportation have made possible the use of fresh fruits and vegetables throughout the year in localities where these would not otherwise be available. Whereas recent experimental studies of nutrition have demonstrated that such diseases as rickets, scurvy, beriberi, pellagra and perhaps others arise in large part from specific deficiencies in the diet-

ary, the facility with which the so-called protective foods can at present be obtained throughout all seasons of the year represents an effective advance in one phase of preventive medicine.

The contributions of chemistry, bacteriology and physiology and also the dissemination of the established facts of disease prevention have during the past three decades given impetus to the development of the science of nutrition. The importance of diet in sickness and health, among children and adults, has been increasingly emphasized by physicians and nurses, by home economics teachers and by public health and social workers. The exigencies of the World War, particularly the necessity for food conservation, directed popular attention to the importance of nutrition. The restriction of diets in some of the countries involved served to emphasize the close relation of public health and preventive medicine to normal nutrition. On the other hand, there were eliminated, by the same forces of circumstance, certain diseases of dietary superabundance prevalent among the upper economic levels of society. As a result certain standards of diet developed which, because of their effectiveness in connection with relief measures, exerted a wide influence in post-war years. No longer are the rations of the gourmand considered desirable even when cost is not a consideration.

In the United States the facilities for research and dissemination of the knowledge of nutrition, sponsored by federal bureaus, state agricultural experiment stations, universities and home economics departments, have proved so efficient that both the health promoting and the therapeutic properties of a properly constituted diet are matters of surprisingly wide knowledge. Inevitably the results of scientific experimentation have been appropriated by food manufacturers for advertising purposes and by charlatans for less approved ends. The food faddists of an earlier day—the fasters, vegetarians, nutarians and the like—have been supplanted to some extent by groups which have applied only partially the tenets of modern nutrition to their dietary program. Asserting that cooking destroys certain essential food factors one group limits itself to the “raw diet,” forgetting the beneficial effects of cooking in facilitating digestion and in the maintenance of necessary conditions of food hygiene. Other faddists prohibit the consumption of meat and potatoes in the same meal lest the acid gastric juice called forth by the protein of the meat interfere with the

digestion of the starch—a fallacy which is obvious to the well informed student of nutrition. The modern tendency of food quacks is thus to appropriate such portions of demonstrated physiological principles as suit their particular purpose and to minimize other equally pertinent details.

The general character of the national dietary of the United States has shown a definite change as a result of this growing popular interest in the science of nutrition. In 1929 the nation's bill for food was over \$23,000,000,000, compared with \$9,300,000,000 for clothes, \$3,600,000,000 for medical care and \$3,400,000,000 for education. There has been a decided shift in emphasis, however, among the various classes of foods. The consumption of wheat has lately dropped to the extent of 147,300,000 bushels annually; the consumption of fats, especially those of vegetable origin, has increased; sugar and dairy products have shown a decided increase, meat a decrease. The industrialization and urbanization of the population have been reflected in the trend toward simpler, more easily prepared meals and in the demand on the part of housewives for ready-to-serve foods. Not only the effect of certain economic and advertising trends is seen in these records of changing food economics but also the influence of an increasing knowledge of the fundamentals of nutrition.

This transition in food habits has been accompanied by less ostentatious but important developments in the more purely scientific problems of nutrition. As late as 1834 the theory was current that all foods contained one nutritive essential—the universal aliment. In that year, however, it was suggested that no ration was complete unless the three staminal principles, fat, protein and carbohydrate, were included. The indispensability of protein for physiological well being was demonstrated in 1839. Since foodstuffs were then believed to be absorbed practically unchanged into the blood stream and since blood and tissues are rich in protein, it was contended that this foodstuff is primarily essential to maintenance of growth. There followed naturally the development of a system of evaluating foods and feeding materials that stressed the protein content. Even then, however, the nutritive significance of the inorganic elements, such as calcium, phosphorus and iron, was appreciated and knowledge of the part played by these dietary ingredients was rapidly extended.

Late in the nineteenth century Rubner for-

mulated his conceptions of the energy factor in nutrition and succeeded in demonstrating that the body as a heat engine conformed to the law of the conservation of energy. At this time too the question of the balanced ration and especially of the optimum quantity of protein occupied the interest of investigators. Early in the present century emphasis shifted from the quantity of protein to the quality, or the amino acid, make up of the proteins, a conception established both by analytical chemical research and by the newer methods of biological analysis. From 1910 on, the results of biochemical investigation pointed to the existence of indispensable accessory food factors—the vitamins—and recent evidence indicates that their chemical nature will soon be established. The further discovery of the nutritive significance of mere traces of unusual metals, such as manganese, copper and iodine, has led to the belief that a satisfactory diet must contain a requisite amount and assortment of amino acids, inorganic elements and vitamins and that, if optimal results are to be secured, the nutritional intake must be adequate for the energy requirements of the body.

Commercially these newer conceptions of the constitution of a balanced diet have had far reaching influence. The demands of an informed public require the constant effort of research laboratories for the control of the various operations involved in food manufacture. The response in the food industries has been striking. Not only is the effort made to produce an attractive product which is sanitary, but processing has been improved to the point where the labile indispensable dietary constituents are preserved to a remarkable degree.

The factors of age, occupation, environment and physical condition have been accorded increasing attention by nutrition experts in working out properly balanced diets for all groups of the population. Children, particularly infants, have benefited greatly from progress in nutrition. Largely through an increased knowledge of nutrition the period of infancy has been transformed from hazard and uncertainty to a reasonable assurance of normal development. Instead of breast feeding, which is practised less extensively than formerly, cows' milk modified to simulate human milk is used. Latterly, however, cows' milk has been employed merely as a base, energy yielding additions and vitamin and mineral supplements being added so that the result approaches a synthetic product. Whether

or not breast milk is given, such adjuvants as orange and tomato juice and cod liver oil have played a large part in maintaining child health. Also because of the efforts of nutritionists improved feeding methods for older children have been introduced into the schools, where carefully planned lunches serve to supplement the remainder of the daily diet.

Dietetics, always an important factor in the care of the sick in hospitals, has found increasing place among the healthy, especially in factories and industrial establishments, where the relation of food to physical fitness is evident. The feeding of other classes of individuals, such as inmates of asylums and prisons and members of the army and the navy, has been changed to conform to the modern conceptions of nutrition; the persons are better fed and the cost to the taxpayer is often decreased. Similarly bread line diets and emergency rations during periods of stress, such as economic depressions, have been planned in the light of modern precepts for optimal nutrition. The fact that where modern dietary principles are effectively practised such diseases as scurvy, rickets, beriberi and pellagra are becoming rare emphasizes again the part which dietotherapy is playing in preventive medicine.

Science has provided the knowledge of what constitutes an adequate, well balanced diet; but a prevailing low standard of living, widespread unemployment or the exigencies of an economic crisis preclude the realization of these standards of nutrition for large sections of the population. The effect of malnourishment upon these groups has been clearly demonstrated in time of financial depression in terms of increased mortality and morbidity rates and a generally lowered resistance to illness and disease. Until a uniformly high standard of living makes possible the utilization of the findings of nutrition by all classes of society, the larger social and economic implications of the problem will remain unsolved.

OASTLER, RICHARD (1789-1861), though he called himself a Tory was a leader in the social discontent which found its expression in the North of England in the Chartist movement. The cause to which he devoted his best powers was that of Factory Reform. He published in 1830 a series of letters under the title "Yorkshire Slavery" which caused a sensation, and from that time he was one of the leaders of the agitation for the Ten Hours Bill. He was a man of violent language and he led the left wing by methods that often alarmed Shaftesbury, the parliamentary leader, who disapproved of all appeals to passion. The position he won by his pen and his voice in the North of England was indicated by his nickname "The Factory King." When he came out on this question he was steward to Thomas Thornhill, a landowner at Huddersfield. Thornhill sympathized with his views on the factory question, but the two fell out over Oastler's views on the new poor law passed in 1834. The new law was very unpopular in the West Riding and in some places resistance was carried so far that the application of the law was postponed. Huddersfield was one of these places and Oastler had been vehement in recommending resistance. He lost his post and for a time he lost his freedom for he owed money to Thornhill. He spent three years as a debtor in Fleet Prison. There he employed his pen with vigor, publishing a series of *Fleet Papers* (3 vols., London 1841-43). His memory is justly honored by a statue in the town of Bradford in the West Riding of Yorkshire. When it was unveiled in 1869 one of the chief

speakers was Shaftesbury, who though his differences with Oastler had sometimes been acute, gave generous recognition to his immense services to their common cause.

OBEDIENCE, POLITICAL. The obedience of the many to the few is the most obvious, as it is the most complex, of political phenomena. Its explanation is a task which has always engaged the attention of political thinkers. Consent, fear, habit, utility—each at different times has been advanced as the reason for obedience. Each, however, embodies at best only a partial truth, and all fail as ultimate explanations because they attempt to deal in rational terms with that which has its roots only partly in reason. The nature of obedience cannot adequately be understood in terms of any one force or principle.

Broadly, the fact of political obedience arises from man's need to live with his fellows. Since social life is for most men an essential condition of existence, so too is obedience to the rules whereby that social life is made possible. The common standards and the complex activities of civilized existence cannot be left to the play of impulse or to the competence of the individual intelligence. Law and order, internal and external, are but the minima of those social requirements in the provision of which individual decisions cannot be permitted. Philosophical anarchism cannot be envisaged in that realm where the needs of the community imply the common regulation of their satisfaction.

As his regulation is implied in the facts of man's nature, so is his freedom; for the enjoyment of common standards of life is not possible without the enforcement of certain uniformities of conduct. That the individual need not make private decisions about those standards is both the reward and the price of social life. For man is born into traditions and institutions to which largely his desires must necessarily conform. Nor is man's history the only check upon his constant alteration of the social context. For such alteration presupposes abilities and opportunities which are denied to most men.

Of all the rules of social life those of the state claim supremacy. They represent the legal expression of the social will, and they claim dominion over every facet of social activity. To

claim dominion, however, is not to achieve identity; for the whole range of varied interests which make up the communal life cannot be compressed into the political category. For example, allegiance to a church and to the wide ideals it embodies cannot be confined within national boundaries. Again, international concepts of right demand a loyalty which may pass beyond that accorded to the state. The members of organizations devoted to the service of such ideals will render a contingent obedience to the state, but they will insist that the two allegiances can ultimately be unified only when those ideals are in a positive manner incorporated in the ends of the state. Until such time the state can have no certainty that its claim to allegiance will always be valid in the eyes of its citizens.

That there exists such a distinction between the state and society can be illustrated by an examination of the way in which the state acts toward its citizens. In the modern state the great mass of citizens cannot undertake the enormous task of governmental decision. They can do little more than express in a formless way the general nature of what will secure their consent. Effective state action, in other words, must be the realm of those few men whose decisions have, for the whole community, the force of law; and it is their task to comprehend the nature of what will secure consent and out of its formlessness to erect statutory guaranties.

That is the purpose of the state, and the state secures obedience only to the degree that it fulfils this purpose. In the long run the nature of the judgment passed upon the acts of the state is determined by the quality of those acts. And if this is true, then what becomes important, from the point of view of obedience, is the effort made by the government to insure that its decisions embody the largest possible measure of social experience. Since obedience depends on the satisfaction of needs, law must be based upon the fullest possible investigation of those needs.

This is not to say that obedience depends upon consent. Consent may mean any one of a variety of attitudes toward the acts of government, and when applied to the real experience of government it becomes little more than a form of words. The true function of consent is not to explain the phenomena of obedience, but to act as the criterion of good government. For democracy is founded upon the belief that while there is a realm of common agreement, there is also a realm in which private decisions have for the individual the highest moral value. Govern-

ment is to be judged not by the fact of unanimous consent to its decisions, but by the assurance that each man's experience should in some way contribute to them. The problem of political obedience requires a double solution: first, the formation of government decisions which will command by their quality the allegiance of the governed and, second, the discovery of political mechanisms which make possible the widest participation in those decisions.

This view emphasizes the duty of the state in insuring obedience. The classic view, on the other hand, was more concerned with placing the onus of obedience upon the citizen. It required obedience to the state because the state was the final lawmaking authority. Its claim to obedience lay in the function it performed of ultimate integration of society. For this reason the monistic tradition denies any final status to associations which stand between the individual and the state, calling its decisions into question and detracting from allegiance to it. The state is the ultimate authority upon which associations depend for the validity of any claim they may have upon its citizens. Since then the will of the state has legal and moral supremacy over all other wills in the state, the problem of obedience is easily solved. It is the origin of the orders of the state which give them their claim to obedience. The state has no duty to provide moral validity for its decisions, for such validity is naturally inherent in them.

It is, however, possible to submit authority to a different analysis—to go behind law and to scrutinize its origin more closely. The traditional problem takes on a different perspective when the acts of the state are resolved into a series of man made decisions. The emphasis shifts then from what government is to what it does. The function of the state becomes the search for allegiance, rather than the postulation of allegiance.

In this analysis the characteristic mark of the state is still its possession of the monopoly of force. But in general it possesses that monopoly in order that no one else may. It uses its force in order that individuals and associations may not resort to violent settlement of disputes. The meaning of the state's possession of force is that the majority of the citizens desire the rule of law and order. The state does not rest upon force, but possesses it while men deem the continuance of peaceful constitutional government to be a desirable thing.

Obedience can be enforced only while the mass of men are in some sort of agreement with the law. There is no lack of examples of opposition, and successful opposition, to government decisions. Government and the maintenance of law and order by organized force are possible because general agreement is given by most people to law and the government. But since peaceful government rests upon the complete observance of rules, it is essential that obedience on the part of citizens should be both constant and unanimous. For the proper ordering of society majority compliance to a law must be widened into general compliance.

But while law is the origin of social peace, its justification of itself to the citizen must remain the prelude to obedience. That justification implies the embodiment in law of those rights to which the citizen attaches value. Obedience may, it is true, be given to such decisions because of the consequences which resistance entails. Or it may be given because the continuance of government as such is considered a greater good than the rights which are denied. But the desire for peaceful government is not a desire which will be satisfied at any cost. There may come a time when men are willing to endure disorder rather than submit to the continued denial of their claims.

This eventuality occurs when resistance ceases to be directed against particular decisions and is aimed at the form of the state itself. To the extent that those satisfactions which men deem essential are provided by associations other than the state there exists the contingency of conflict between allegiances. The monopoly of political power cannot be claimed for the state while men recognize the authority of groups as more real than that of the state. Since men at different times place different values on ideas, so loyalty will swing back and forth between the ideas embodied in the state and those incorporated elsewhere. It is only at certain times that the hold of the state idea is so strong as to exclude loyalty to other groups. If men want most those goods which a group can provide, their allegiance will be first to the group. If they desire such goods as law and order, which the state can provide, then their allegiance is to the state at the expense of the groups. Moreover there is every variety of degree in these allegiances as between the state and the groups.

It is possible to argue that such a view leaves the way open to disorder and therefore ultimately to dictatorship. But if disorder and

Caesarism are phenomena of the life of states, the theory which contemplates their possibility has at least the merit of realism. Therein, by contrast, is implied the unrealism of the analysis which assigns to the state the role of umpire in the conflict of groups. The state cannot be regarded as separate from the men who order it, nor can those men be considered as separate from their loyalty to particular ends. Thus it cannot be assumed that the agents of the state will organize the life of the state in the good faith of impartiality. But if, on the contrary, no such assumption is made, it is possible to acknowledge the absence of social integration within the state and to contemplate the struggle of different desires, even where the outcome of that struggle may be, as in Fascism, the emphatic victory of one desire over all others. For constitutional government is not an end in itself; it commands obedience only so long as its blessings are not too high a price for other goods. On the other hand, those goods can be measured against law and order; and where the latter are deemed necessary at any cost, the outcome may be Fascism. When the choice is made of the fulfilment of one need rather than another, there may have to be some sacrifice of the organization which looks out for the neglected needs. But there is no reason to believe that when once again men place a different value upon the blessings of a dictatorship, in terms of other satisfactions, they will not suitably relegate that organization into a position more commensurate with the new evaluation.

OBRADOVIĆ, DOSITEJ (1742-1811), Serbian national leader. Obradović was born in southern Hungary and entered the Hopovo monastery of Fruška-Gora in 1757. Impelled by a passionate desire for knowledge he began to wander through Europe in 1760, settling in 1771 in Vienna, where he remained with some interruptions for twenty-two years. He there came into contact with western European enlightenment. He now came to look upon learning as a means of advancing the human race and not merely as a method of earning his livelihood, but the inner drive to communicate his intellectual treasures caused him to appear almost everywhere as village schoolmaster, tutor, mentor and educator. He took over the direction of education in Serbia after its liberation by Karageorge, and by his practical activity as minister of education as well as by his writings he was influential in the spread of enlightenment among the Serbians.

Obradović was neither an original nor a profound thinker; he merely absorbed ideas which had already been thought out in western Europe and cast them into forms which he considered suitable for his people. In accordance with the current rationalism he believed in the omnipotence of education. For Serbia, however, which was still in the thrall of mediaeval and oriental ideas, he accomplished an extraordinary feat in that he turned it toward the west and pointed out the sources of western culture. He thus became the intellectual recreator of the Serbian spirit, the pathfinder into the nineteenth century, the first European mind at the junction of the Sava and the Danube.

Since it was always his endeavor to be understood by the masses, Obradović wrote not ecclesiastical Serbian or Slavo-Serbian but folk Serbian, in this respect being a precursor of Vuk Stefanović Karadžić. At the same time he regarded the language as a unifying bond for all Serbians, and no one before him pointed out so forcibly and clearly the linguistic unity of the inhabitants of Montenegro, Dalmatia, Bosnia, Herzegovina, Serbia, Croatia, Slavonia, Syrmia, Bačka and the Banat. Again he was a pioneer in considering the nation as superior to the church, for he believed language and race to be fundamental while faith and laws were fortuitous; and since he included even the Moslems of Bosnia in the national unity, he appeared as the creator of modern Serbian, even of Yugoslav, nationalism. Obradović not only was admired and worshiped by the Serbians but even among the Croats his influence persisted, especially during the Illyrian movement; while among the Bulgarians he was one of the most widely read writers at the time of their national awakening.

OBRECHT, GEORG VON (1547-1612), German jurist and writer on economics. Obrecht was born in Strashourg and studied at Tübingen, Besançon, Dôle, Orléans and at Basel, where he received the degree of doctor of jurisprudence in 1574. In the following year he was appointed professor of law at the University of Strashourg, where he acquired a great reputation as a scholar and teacher.

Although Obrecht is the author of a number of legal works he is best known through his *Fünff unterschiedliche Secreta Politica* (Strasbourg 1617), a work setting forth his economic views, written at the request of his friend Emperor Rudolph II. He is regarded as the forerunner of the early German cameralists and appears to have been strongly influenced by the so-called juristic tax literature, especially by

Bodin. He was a typical fiscalist, desirous above all of increasing the revenue of his prince. To attain this end he proposed an increase of the various duties, particularly those on luxuries, recommended the introduction of some form of inheritance tax and advocated a wider use of court fees and fines as a source of revenue. He classified the sources of revenue according to their incidence upon the standard of living of the taxpayers and generally favored property rather than personal taxation. He was in favor of the typically mercantilistic tax on exports and imports, recommending, however, that raw materials be imported at reduced rates. Insisting that gold should remain in the country, he urged the prohibition of the export of precious metals. He opposed the monopoly of the guilds and advocated the promotion of agriculture and industry, the subsidizing of commerce and shipping by the prince and the introduction of a standard currency for the entire German empire. Noteworthy too was his proposal of a children's savings bank and state endowment insurance. In suggesting an elaborate plan of registration and police regulation of the people he laid the foundations for a complete system of population statistics. But, as in all his proposals, the revenue of the prince was the prime consideration and the census was to be made the occasion of collecting various registration fees for the prince's treasury.

Jahrhundert* (Jena 1911); Zielenziger, Kurt, *Die alten deutschen Kameralisten*, *Beiträge zur Geschichte der Nationalökonomie*, no. 2 (Jena 1914) p. 176-98.

OBREGÓN, ALVARO (1880-1928), Mexican statesman. Obregón had been a rancher for many years when in 1912 he joined the revolutionary movement. Two years later at the head of victorious troops he entered Mexico city and soon thereafter became secretary of war under Carranza. The leader of the radical group, Obregón grew disgusted with Carranza's inefficiency and the latter's efforts to impose his successor upon the country; early in 1920 therefore

Obregón led a successful revolt and was elected president.

At the time Mexico was completely demoralized and relations with foreign governments were strained. Largely through an amnesty to all his political opponents Obregón pacified the country: lawlessness decreased, railroad traffic was gradually resumed, payments were made on international obligations and assurances of safety were given foreigners. Although Obregón was friendly toward the United States he refused to give the pledge which Secretary of State Hughes demanded before recognition—that there would be no interference with property rights of American citizens in Mexico—but his obvious willingness to be fair to foreign interests and the pressure of public opinion led the United States to recognize the new regime in 1923.

Meanwhile the administration made the first serious effort to put the decade old revolutionary program into effect. Labor was permitted to organize for self-protection and did so on a large scale. During Obregón's term several million acres of land were distributed to landless peasants; but as there was no adequate provision for water for irrigation, little improvement resulted. The administration's chief contribution to reform was its educational policy. For the first time in Mexico's history plans were made to extend literacy and enlightenment throughout the nation. Under the lead of José Vasconcelos, minister of education, volunteers of all ages began to teach the A B C's to their fellows, thousands of elementary schools were established at national expense, facilities were offered for technical training and plans were launched to make the isolated Indians a conscious part of the body politic. These advances in education were particularly impressive in view of the financial handicaps confronting the administration. Revolutionary outbreaks, however, toward the close of Obregón's term destroyed many of the reconstructive measures of the new regime.

Obregón cooperated with Calles, who succeeded him in 1924, and was in turn elected to follow Calles in 1928. Shortly afterward he was assassinated by a religious fanatic.

OBRENOVIĆ DYNASTY, Serbian rulers. The Obrenovići reigned intermittently in Serbia for seventy-two years between 1815 and 1903. They were a powerful influence in shaping Serbian development, for they were all endowed with political talent or at least had an interest in politics. Under them, although sometimes more or less against their will, Serbia was transformed from a 'Turkish pashalic into an independent kingdom and from a patriarchal despotism into a constitutional state with administrative, financial and military systems following the western model. Moreover they fostered a strong independent rural population, which played a great part in the nation's history. Their task of building up Serbia was complicated by the fact that they had to reckon not only with the Serbian people but with Turkey and also with the great European powers, especially Russia and Austria.

Miloš (1780-1860), the founder of the dynasty, was an illiterate peasant endowed with great shrewdness and an almost infallible political instinct. He became the leader of the Serbs after the Serbian defeat and the flight of Kara-george in 1813. On his promise to restore order the Turks named him voivode of Rudnik; and when a new revolt broke out, Miloš was hesitant about allying himself with either side. But in the spring of 1815 he joined the rebels and from then on tried to trick the Turks of territory by diplomacy, compromise and bargaining. In 1817 he was elected prince of Serbia, again with the assistance of Turkey, and by 1830 the Porte was forced to recognize the internal independence of Serbia with Miloš as hereditary prince. A true oriental despot, he ruled the Serbs in the Turkish tradition and enriched himself enormously at the expense of the people. Nevertheless, his very despotism made it possible for him to consolidate Serbian independence and to establish its government; while he contributed fundamentally to the growth of democracy and of strong national sentiment by preventing the development of a landlord class through his division of the abandoned lands of the Turkish spahis among the peasants. Although Miloš was glad to accept Russian support especially in the Peace of Adrianople in 1829, he opposed Russia when it forced upon Serbia a constitution which through an indissoluble senate limited materially the prince's freedom. He abdicated in 1839 but ruled again from 1859 to 1860.

His son Mihailo (1823-68) reigned from 1840 to 1842 and from 1860 to 1868. Realizing the

important role that Serbia might play in southern Slav affairs, he drew up political plans so vast and audacious that they sometimes seemed impossible fantasies and not only attempted internal reorganization but also initiated an ambitious foreign policy. He modified the oligarchic constitution of 1838, curbed the powers of the senators, established a national army and made changes in the administrative system. He continued his father's policy of protecting the small landholder by founding in 1862 the Uprava Fondova, a state agricultural credit bank. Serbia's series of Balkan alliances, with Montenegro in 1866, with Greece in 1867 and with Rumania in 1868, were part of Mihailo's plans for a general Balkan war of liberation against Turkey for which he was preparing at the time of his assassination; in addition his schemes reached out toward Bosnia, Herzegovina, Syrmia and Croatia, culminating in the idea of a great Slav state which was to include the Bulgarians also. He brought about in 1867 the withdrawal of the last 'Turkish garrisons from the six fortified cities of Serbia.

Mihailo was succeeded by his cousin Milan (1854-1901) in 1868, although the regency did not cease until 1872. The constitution of 1869 had tended to make the political parties a real factor in government, but Milan used them only as foils for one another in order to exercise arbitrary power more freely. The only important social legislation of his reign was a law protecting the peasant's home, stock, tools and six yokes of his land from the money lender. By the Treaty of Berlin Serbia became completely independent and in 1882 the prince proclaimed it a kingdom. Milan gave a new turn to Serbian foreign policy when in 1881 he concluded a secret treaty with Austria, which gave the latter a predominant influence in Serbian foreign affairs. He declared war on Bulgaria after its union with Eastern Rumelia in 1885 made it appear a natural successor to Serbia in the leadership of the Balkans, and Serbia was saved from disaster only by the intervention of Austria. The king's liberal constitution of 1888 failed to quell the general dissatisfaction and a year later Milan abdicated in favor of his son Alexander (1876-1903).

The latter's reign was marked by instability and a series of coups d'état. Alexander despised and combated the parliamentary system introduced by the constitution of 1888, and in foreign relations swerved from the Austrophil policy of his father by occasional manoeu-

vres in the direction of Russia. His unpopular marriage crystallized the resentment against his rule and led to his death at the hands of assassins.

O'BRIEN, JAMES (BRONTERRE) (1805-64), Irish social and political reformer. O'Brien attended the Edgeworths' school at Edgeworthstown, Ireland, and in 1830, one year after his graduation from Trinity College, Dublin, entered Gray's Inn, London, to continue his legal studies. Almost immediately he was swept into the growing radical reform movement. Although he afterwards developed into an orator of no mean capacity, his early work in the cause of the working classes was in the field of journalism. In 1831, following his publication under the nom de plume Bronterre of three articles in Carpenter's *Political Letters*, he became editor of the *Midland Representative and Birmingham Herald*. Subsequently he edited Hetherington's *Poor Man's Guardian* (1831-35), the *Twopenny Dispatch* (1836), *Bronterre's National Reformer* (1837) and the *Operative* (1838-39) and was joint editor of the *London Mercury* (1837) and the *Southern Star* (1840). From 1838 to 1841 he was one of the foremost leaders of the Chartist movement, but after 1841 largely as a result of his bitter quarrel with Feargus O'Connor his influence gradually declined. Later he edited the *National Reformer*, and *Manx Weekly Review* (1846-47) and wrote a series of articles in *Reynolds's Political Instructor* (1849-50).

A vitriolic opponent of the existing social and political order and an apostle of the class struggle, O'Brien was an admirer of Babeuf, Robespierre and Robert Owen. He was never an Owenite, however, for Owen had no faith in

political action, while O'Brien believed that improvement in the condition of the working classes could materialize only after the common people had attained control of the legislature through universal manhood suffrage; hence his ardent advocacy of the People's Charter. In addition to the worker's ignorance, which O'Brien zealously sought to combat, the chief obstacles to reform were in his opinion the vested interests of the aristocracy and the moneyed middle classes—the "capitalists, stockjobbers and other gamblers." He did not condemn private property, competition and machinery as such but rather the abuses associated with them in a "cannibal civilization." Machinery owned and operated by the workers and competitive effort, for instance in the field of scientific research, would assuredly increase human welfare. But such potentialities were forestalled by that "overwhelming evil . . . the profit-hunting system, *alias* the unjust power of *capital over labor*." "If every one were paid the full value of his services," he said, "there would be no unjust accumulations"; he failed, however, to indicate how the "full value" was to be determined. By far the most pernicious usurpation by the upper and middle classes was the private ownership of land. Deriving his opinions from a study of Thomas Spence, William Ogilvie, Charles Hall and Thomas Paine, O'Brien became the chief Chartist exponent of land nationalization. His practical proposal was that by purchasing estates upon the decease of their existing owners the state should gradually make itself trustee in perpetuity of all the land, letting it to cultivators and assuring to every tenant farmer sufficient temporary credit to stock and crop his farm.

During his participation in the Chartist movement in 1839 O'Brien became so incensed at the apathetic attitude of Parliament that he worked himself into a violently revolutionary frame of mind, but after his imprisonment for seditious speaking he reverted to the tactics of "moral force." He never attempted to expound a systematic body of socialistic principles; his main aim throughout seems to have been the immediate attainment of political reforms by means of which, as he believed, the social and economic salvation of the working classes could speedily be worked out.

OBSTRUCTION, PARLIAMENTARY. Parliamentary obstruction is an elastic term which means different things to different men. It is not always easy to detect, for what seems to be obstruction may be nothing more than long-windedness, while apparently genuine debate may in reality be dilatory. A minority naturally attempts to thwart or at least to delay the will of a majority which is ready to act and in order to accomplish this purpose seizes on every available weapon. Obstructionist tactics vary somewhat with different parliaments, according to the loopholes which can be found in the rules of procedure limiting debate and permitting the expedition of business. Certain general patterns and tactics can, however, be discovered in the experience of various legislative assemblies.

One of the most obvious means of obstruction is the long drawn out speech. Where members may speak as long as they wish, physical endurance alone is sufficient to make obstructionist tactics successful. This is still true of the United States Senate, where the closure rule, adopted in 1917, is difficult to apply and hence rarely invoked. In practically all other assemblies the government can usually apply closure (*q.v.*). Since 1841 no member of the House of Representatives may speak for more than an hour except by unanimous consent. Before 1881 the rules of the House of Commons made no provision for closing debate so long as anyone wished to speak. On the Irish Church bill and the Land bill of 1870 there were 14,836 speeches, of which 6315 were made by Irish members. During the session there were two thousand points of order and it was clear, as the speaker declared, that Parnell with his minority of twenty-four dominated the House. On the other hand, as Lord Morley remarked, "the suspension of habeas corpus is a thing that men may well think it worth while to fight about, and a revolution in a country's land system might be expected to take up a good deal of time." The gradual elaboration of the closure, inaugurated in 1881, now makes obstruction of this sort impossible.

When the rules of parliamentary assemblies provide for closure, ingenuity in respect of

points of order and dilatory motions becomes important. The choice of device is influenced by the particular rules of order of the assembly as well as by the state of the parties—that is, the size of the majority—and by the nature of the legislation involved. Thus under Speaker Reed in 1890 the Democratic minority effectively obstructed proceedings in the House of Representatives by refusing to answer the roll call. Since the Republican majority was narrow and absences from its ranks were inevitable, there could be no quorum unless the minority was willing to be recorded. In a ruling comparable to Speaker Brand's coup which ended the obstruction of Irish members in the House of Commons in 1881 Reed ordered that members present be counted toward the quorum. The point of no quorum, however, can still be used for obstruction in most legislative bodies. It can be made in the House of Representatives whenever less than a majority is present (in the Committee of the Whole, less than one hundred), and the roll call which automatically follows may take thirty minutes. It is not uncommon for more than one hundred of such points of order to be raised during a congressional session, involving the loss of fifty working hours, equivalent perhaps to ten legislative days. If forty members are not present, the House of Commons can be "counted out" and adjourned until the next day. Cabinet control is so complete that this device cannot obstruct government business, but it is useful against bills of private members. Dilatory motions—to adjourn, that the speaker leave the chair and so on; points of order and their discussion; frivolous amendments to pending legislation, all such devices are possible. The speaker of the House of Commons has considerable discretion in refusing to accept motions which he deems dilatory or in putting them to a vote without debate. The extent to which obstruction is successful depends on the looseness of the closure rules, on the majority's willingness to deal ruthlessly with the minority and on its continued enthusiasm for the pending measure.

Perhaps the most sustained recent filibuster in the House of Representatives occurred in connection with the Dyer antilynching bill, which was bitterly opposed by all southern representatives. When it was reported to the House on December 19, 1921, the roll was called twice on points of no quorum and once on a motion to adjourn. Then a special order from the Rules Committee provided for ten hours of general

debate, the bill thereafter to be open to amendment under the five-minute rule. There were five roll calls on points of no quorum and on a motion to adjourn before this special order was adopted. The next day there were five roll calls and no debate on the bill. Southern Democrats absented themselves, so that a quorum was not present. But such tactics could not continue indefinitely. Debate was finally engaged in. The original allowance of ten hours was raised to sixteen and the measure was passed after as many days of consideration as hours of debate which had finally been agreed to.

In the Senate, however, business was completely tied up through the expedient, similar to one of those used by the obstructionists in the Austrian parliament at the end of the nineteenth century, of refusing the customary unanimous consent to dispense with the reading of the journal of the previous day's session, of proposing of amendments and corrections to the journal and then of debating these changes. Discussions as to whether the journal recorded the correct hour at which the vice president had entered the chamber and whether the prayer delivered by the chaplain should be included in the journal were the pegs on which the southern senators who opposed the Dyer bill hung time consuming speeches. After several days the Republican leaders admitted defeat and withdrew the measure. Such a filibuster would hardly be possible toward the close of a congressional session, when the Senate frequently recesses rather than adjourns. Over a number of calendar days it may preserve the fiction of a single legislative day, thus doing away with the necessity for the approval of a daily journal and saving the time which under the Senate rules is usually spent in "morning business." Spectacular parliamentary obstruction becomes more and more infrequent as closure rules are made more severe. So also violent obstruction, although not extinct, is at least rare.

A good deal of parliamentary obstruction is indirect and at the time is not clearly marked. Most legislative proposals are highly complicated and bristle with technical difficulties which, to be understood by members, must be tediously explained and discussed. A clever opposition can use up time on such details, especially when no actual differences are involved, without laying itself open to the charge of obstruction. As Lord Eustace Percy told the Select Committee on Procedure on Public Business in 1931: "The serious charge is that we

obstruct non-contentious legislation in order that there may be less time for the passage of contentious legislation."

All parliaments are arenas for deliberation; but with material interests assailed and threatened, with parties espousing different policies and individuals holding different opinions, the deliberation can come only from contention and conflict. So long as this is the case, individuals and minorities will resort to parliamentary obstruction. It will sometimes be personal—to get publicity for the obstructionists—or it will be a measure of party strategy—to embarrass the majority leaders. In other cases the obstructionists will be actuated by motives not unconnected with their conscientious view of the dangers of the proposed legislation and in some cases their view will prevail. Some of the greatest statesmen have on occasion been obstructionists. For example, Edmund Burke forced twenty-three divisions during a single sitting of the House of Commons.

In the minds of those who employ them obstructionist tactics are always justified. Occasionally results are such that justification is generally admitted. Not infrequently obstructionist tactics delay a proposed measure until it is improved or until parliamentary or public opinion changes and the measure is abandoned. As the price of their desistance obstructionists may sometimes, especially in the United States Senate, receive promises that measures which they sponsor will be given consideration by the assembly. With party lines rigidly drawn as they now are almost everywhere a majority party rarely finds it difficult to use a steam roller. Indeed necessary business would not otherwise be dispatched. Obstructionist tactics are frequently the only means of delaying the steam roller long enough for the proposals to be understood clearly. In every legislative assembly moreover majority leaders are seldom overgenerous in the time allowed the minority for debate, and the latter therefore may be compelled to obstruct in order adequately to voice its opinions. The difficulty is, however, that no clear line can be drawn between justifiable obstruction and obstruction which simply throws grit into the bearings of the legislative machine. Such a distinction is always conditioned by one's attitude toward the action proposed.

OCCUPATION

THEORY AND HISTORY. In modern society, with its characteristic division of labor, specialization of functions, exchange and prevailing ideology, the overwhelming majority of the people engage in a specific, relatively continuous activity in order to earn their livelihood and maintain a definite social status. This activity in the literature of the social sciences is designated as occupation. One need not go as far as Simmel, who believed that the concept of occupation is fundamental to the true society, to perceive that modern society, at least for the time being, is organized on an occupational basis. For occupation is a fact which distinguishes one man from another, giving every individual a feeling of independence, and at the same time unites as equals men of different origin and background. Occupation leaves its impress upon the inner being of individuals, affects vitally their external life histories, serves as the link binding them to society and thereby gives specific form to the social structure.

The term itself is indefinite as to both meaning and scope; it has a varying intellectual content and emotional associations. In all modern languages it has a number of synonyms, and the range of their meaning indicates how much the specific content of the term has shifted with the succession of historical epochs. Although it merely reflects the continuous changes in the reality to which reference is intended, the linguistic confusion itself becomes an obstacle to effective action by student, legislator, organizer and administrator. The meaning of the term can definitely be fixed for a short period only. And even with this limitation the term must cover three different sets of facts: technological—the specific manual or mental operations involved in the execution of occupational work; economic—the income yield of an occupation which serves to provide a livelihood; and social—the prestige attaching to a person or group by virtue of occupation. It is this complexity which makes possible a shift of emphasis as historical conditions change; for example, the economic aspect

of occupation, which is the most important at present, came to the fore only as late as the mediaeval town economy; before that work for an income was not regarded as proper, income itself being a function of social status rather than of occupation.

In accordance with current popular and statistical usage occupation may be defined as that specific activity with a market value which an individual continually pursues for the purpose of obtaining a steady flow of income; this activity also determines the social position of the individual. As defined above occupation is linked up closely with the present social and economic system, in which production is for sale and not for use; occupational work must be available for purchase in the open market, although it need not necessarily be carried on in a business enterprise. Subjectively occupation is the specific activity by which a living is earned, a duty imposed from the outside as a necessary condition of life in society; objectively it refers to the dovetailing of individuals into the innumerable spheres of activity into which modern economic society is divided. Occupational work is the individual's contribution to the national dividend, and the sum total of occupied persons constitutes the labor power of the nation.

The above considerations as to the relation between individual, occupation and society are subject to qualification even for the modern period. To begin with, not everyone has an occupation. Apart from children and those still training for their vocation at one end of the age scale and the sick and aged at the other, all of whom must be supported by the working population, there are in modern society persons of independent means—rentiers, pensioners and the like—who share in the social product without pursuing any real occupation. In recent times continuous unemployment has created a new group of people who live without working; the ambiguousness of their social status is the obverse of the still unsettled question as to whether the technologically unemployed constitute a separate "occupational" group. In the second place, an individual may engage in several trades, one of which will be recognized as his chief occupation because it conditions his social position and yields the major portion of his income. Nor is occupation in modern society a rigidly limited sphere of hereditary activity; on the contrary, occupations tend to merge and subdivide and changes of occupation are a frequent occurrence.

A striking fact about the occupational structure of modern industrial states at approximately the same stage of economic development is that it is fundamentally the same in all of them. Occupational lines are shifting; the personnel of any specific occupation is fluid and yet, despite this marked mobility in particulars, the proportions between the larger occupational strata—and hence the structure as a whole—remain fairly stable over long periods of time. This suggests two forces at work, one making for change and the other tending to redress the balance. With regard to the social division of labor, which lies at the basis of occupational differentiation, these forces may be identified as the rational adaptation to the demands of the economic system and the traditional adherence to the institutions of the past. The two are combined in varying proportions in different societies, the contrast being greatest perhaps between an economy with a long “mediaeval” history and one developed in a colonial country. In either case it would be a gross error to assume that present occupational stratification may be explained in terms solely of economic traditionalism or of economic rationalism. Every occupational hierarchy has grown out of a previous set up, much of which it has destroyed but from which it has salvaged something, perhaps no more than a code of occupational ethics.

Throughout the greater portion of history society in all its manifestations has been shaped by authority and primarily by religious authority. Its influence upon modern developments can therefore scarcely be denied. Thus recent studies of Protestantism as a force in the evolution of capitalism show that it invested lay economic activity with new spiritual values; in providing the secular striving for monetary return with a substratum of meaning and dignity it released human beings from the oppressive isolation into which they were sinking when the old guild system was being replaced by competitive capitalism.

A more direct manifestation of the influence of the past is the modern tendency toward a corporate organization of occupations. This implies a definite group ideology, which may or may not be sanctioned by the state, and the recognition of an occupation as a public entity with special legal rights, fixed powers and a defined internal organization. In a sense the corporate and the occupational represent two opposed principles of social organization; they are the modern counterpart of the closed, static,

conservative type of community, the extreme of which is the caste system, and of the free, dynamic, progressive type, the purest realization of which is a society according to every individual a position exactly suited to his personal gifts, qualifications and wishes. While the structure of all societies before the modern period was predominantly corporate rather than occupational, modern society lies between the two extremes; it reflects the movement from the closed to the free society as well as that in the opposite direction. Doctors, lawyers, scholars, military men and members of the other so-called intellectual and liberal professions, which easily develop an *esprit de corps*, a group consciousness and an internal organization, attain a corporate existence. In the older countries the proletarian organizations are also in the process of changing from mere occupational bodies into corporate associations. This process would have been much accelerated if the ideology of class consciousness and class struggle, which denies the validity of the corporate and occupational concepts and at the same time aims at the transformation of the proletariat into the only corporate body in society, had not hindered the development of a clear cut corporate ideology and a code of corporate ethics. It is this duality of outlook which explains many conflicts as to principles of labor organization, such as that between craft and industrial unionism. Under Fascism, with its program of a corporate organization of society, this process has been greatly stimulated by the endowing of occupational bodies with public legal functions and powers.

The force of tradition in modern society is perceptible also in the allocation of high prestige value to certain occupations, which can scarcely be related to their social utility. Were it possible to construct a hierarchy of occupations on so rational a basis as their social utility or productivity, the prestige attaching to them would have to be in accord with their market price or, in some cases, high income would have to offset low prestige. In fact, however, a rough correspondence of prestige to income is found only in business occupations. In other fields, particularly in the liberal professions, social position is largely independent of the lucrateness of the activity and is often in inverse ratio to it, representing the continuance of the values of the past, when a particular calling had a monopoly character, required unusual talent or was a public function invested with a special dignity.

Since occupation is not simply an economic

or a technological fact, occupational evolution is not merely a part of economic history or an aspect of technological progress. It is rather an important constituent element of general social history, whose salient characteristic is that it cannot be fitted into any rationalistic stage schema. Nevertheless, systematic exposition must assume as its background a general outline of the succession of industrial organization forms, such as that of Karl Bücher. In occupational development industry—processing and fabricating operations—has always been the dynamic factor, perhaps because of the possibilities for division of labor which inhere in it; for this reason a sketch of changes in internal organization of industrial units and in their external interrelations furnishes essential clues to occupational history.

The oldest and earliest distinct occupations have everywhere been the "spiritual" professions—those of magician, soothsayer, prophet, medicine man, singer. Such professionals possess a charismatic monopoly and a socially exempt position; yet they are not economic specialists but rather exercise a calling in the old sacramental sense of the term. Division of labor proper occurs at first not within the tribe but as between tribes. In tribal society the extraction and raising of raw materials and their processing take place within the same economic unit although with a clearly marked separation of functions between the sexes; at the same time there is a regular intertribal exchange of goods, sometimes with a complex organization, a fact which contraverts the usual assumption that trade must be based on division of labor. Specialization of skills growing out of differences in natural aptitudes and accidents of technical discovery is fairly common at later stages, but the major portion of the maintenance of the specialized families is still obtained through their direct efforts. Intracommunal occupational differentiation appears only with the decay of tribal society, the mixing of different ethnic strains. Thus the introduction of slave labor, which represents a method of utilizing the strange lore and skill of captive aliens, leads to a loss of the early polymorphic economic habits; similarly the use of political authority which dominates several neighboring tribes creates, through imposition of tribute and assurance of peace, the necessary conditions for the further specialization of skills, the growth of internal exchange and the separation of occupations as economic entities.

A more clear cut division of labor on a large scale takes place in the self-sufficient seigniorial units, such as the slave economy of antiquity, the liturgical public economy of Ptolemaic Egypt or the economy of the mediaeval manor and monastery. Thus the *familia rustica* of the Roman senator embraced an elaborate array of craft specialists; and the slaves of the *familia urbana* were even more specialized. In the early Middle Ages conditions were more primitive, for Charlemagne's capitulary *De villis* lists only twelve crafts, yet in some European countries technical progress remained dependent upon the seigniorial economy as late as the seventeenth century. In these units specialization was the immediate distinguishing mark of bondage; the free population was not engaged in productive work and was not differentiated occupationally. When free crafts did appear they bore many earmarks of their servile origin; thus the luxury trades which flourished in the seigniorial units attained a high degree of development prior to the more important trades catering to general consumption.

Social division of labor began with the appearance of so-called wagework, the stage in which the worker owned the tools and the customer provided the raw material. As a man with a trade, ready to serve anyone for compensation, the craftsman became an individual of public character. Like the early "spiritual" professional he assumed the performance of certain public functions and may therefore be said to have filled a public office. Similarly to the demiurgi of Homer's time and the handicraftsmen in present day Indian villages the craftsman of the wagework period was a communal official. Occupation, now for the first time recognized as a social category, has thus always been more than a special skill.

The period of wagework continued in Europe until the fourteenth century; by that time money economy in the cities had made appreciable headway and the practise of working up customer's material was being replaced by the better known form of handicraft organization, in which the worker owned not only the tools but also the raw materials and in some cases the workshop. At this stage crafts became organized into guilds, public corporations which furthered the economic interests of their members while at the same time assuming responsibility for providing needed goods of assured quality at moderate prices. In its technological aspects the guild system made for an even higher develop-

ment of skills than had hitherto been the rule, although they became less individualized; in other words, all members of an occupation conformed roughly to certain standards of performance. On the economic side there was a vertical split in industrial production, the separation of phases of the manufacturing process theretofore carried on under one roof into independent industrial branches. This necessitated mutual exchange between specialized economies, which now produced for the outside rather than for direct satisfaction of their own needs. Exchange, however, remained closely related to production and was for the most part the terminal productive operation; both took place within the limits of a single city and both aimed at the maintenance of traditional standards of living rather than profit. Socially guild handicraft involved the creation of a new type of property, industrial capital, yielding as only land had done previously a constant return, which was superimposed on the compensation of the wage craftsman to form a new economic category; those engaged in industry thus ceased to be a mere occupational group—they became a new property class which aspired to the social and political importance hitherto attaching only to the landlord. Finally the political significance of the guild system lay in developing a system of industrial self-government, the autonomy of which was more marked on the continent than in England, where as early as the twelfth century guilds fell under the influence of the royal power. The rigid corporate organization of occupations was the most characteristic feature of mediaeval economy. The exercise of an occupation was not a matter of individual choice but a privilege, often hereditary, of guild membership; occupation was thus a function of social status. Occupational practises were regulated according to norms fixed by the town council, itself no more than a joint guild board, which aimed to promote the welfare of the city as measured by a traditional standard of living.

The regulated economy of the guild town society disintegrated with the growth of a centralized state organization, unification of large economic areas and radical changes in the technique of production and distribution which came in the seventeenth and eighteenth centuries. Commercialization and later mechanization of industry resulted in a regrouping of occupations and eventually in the creation of a new occupational order. Where division of labor in the handicraft system multiplied independent

economic units, division of labor in the manufactory and factory—the new forms of industrial organization—created a new permanent class of wageworkers. Industrial society divided into two antagonistic classes, capitalist entrepreneurs and the proletariat, and the social functions of the old occupational corporations passed on to the state.

Some of these changes became manifest first under the putting out or contracting system, a natural outgrowth of the splitting up of production among so many crafts that they could no longer depend upon the local market. The new capitalist entrepreneur, originally a town merchant or prosperous handicraftsman, undertook now to purchase for resale the output of the producer—the poorer craftsman in the city or the peasant in the country—who spun and wove to supplement his meager income from agriculture. If he succeeded in building up a market, it was to the interest of this entrepreneur to assure a steady supply of stock in trade by providing raw material to his producers and when necessary by paying in advance for work to be done. A wholesale merchant thus came between the producer and his market; the producer lost thereby his economic independence and the distribution process, hitherto a simple matter of personal contact between producer and user, was now turned into a series of functionally related services with separate business organizations.

As the industrial revolution followed the commercial, so the factory succeeded the putting out system. In the factory division of labor involved a technically rational breaking down of productive operations into more or less simple manipulative acts entrusted to separate workers; skilled work was thus differentiated from unskilled, heavy from light. Where the handicraft system admitted of merely temporary gradations of apprentices, journeymen and masters, the factory built upon permanent categories of skilled and unskilled labor. Factory workers never mastered all the stages of production even in a highly specialized branch of industry; instead they were aided and directed by an entirely new class of higher industrial officials, specialized as to technical and business training. The capitalist entrepreneur too, concerned solely with the mercantile aspects of his business under the putting out system, now assumed also a general technical supervision of the productive processes. Thus the true proletariat began to emerge. The free laborer now owned neither

tools, raw materials nor workshop; he had to submit to a discipline imposed by a technical process which he did not even understand. He had no interest in the success of the industry, in the quality or price of its product; he incurred, however, a financial risk in connection with his occupation without clearly realizing it except in bad times when his income was reduced or eliminated. A "hand" without a face, an item in the inventory of industrial equipment, the factory worker's labor power was purchased like a commodity.

The new industrial system and occupational differentiation led also to a change in the relations between occupation as a social grouping and society as a whole. Corporative organizations of the handicraft era, traditionalist, restrictive, monopolistic, were incompatible with the progressive technique and competitive spirit of the new system; they disintegrated under pressure first of territorial and national governments and later of the new capitalist bourgeoisie. Their regulations were replaced by state enactments; although in certain respects they still followed corporative traditions, these on the whole assured freedom of occupational choice. This could scarcely have been otherwise in bourgeois society, based as it is upon the idea of individual liberty; nor could industrialization have proceeded under conditions other than those of *laissez faire*—extensive freedom of economic action—and of *laissez passer*—freedom of movement for both persons and commodities. Occupation now ceased to be an office, a duty recognized and enforced by authority; it became merely a social function, freely assumed by each individual, after he had balanced personal inclination against economic necessity, and pursued without overt authoritarian intervention. True, the romantic-conservative philosophy and the more recent ideology of "service" view occupation as a duty delegated by society to the individual in the interests of the common weal. This, however, is a statement not of empirical fact but of a moral philosophy which postulates a maximum of heroic and altruistic virtues in the individual; in fact only in a theocracy or in an autocracy can an attempt be made to translate it into action.

Emancipation of occupational life released the energies of the people, activating them to a more vigorous although not always a socially efficient pursuit of economic occupations; and yet this emancipation was only from official restraints and not a true liberation of occupations

whereby they might become accessible to all whose natural gifts and inclinations would fit them for such work. A genuine freedom of occupational choice means availability of opportunities and unlimited discretion in choosing among them; it should result in a complete harmony between the man and his job, a condition obviously not realized in modern industrial society.

Although the formal freedom of occupation dispensed with many tangible obstacles to the attainment of this ideal, a great many factors still operate to prevent a perfect correlation between individual capacity and its occupational utilization. Thus, while the improvement in transportation, communication and organization of the labor market favors greater geographical and to a certain point occupational mobility of labor, immigration barriers check the inflow of labor from the outside; social insurance provisions bind the worker to his old residence, occupation or even his job; and social prejudice tends to stabilize if not to exaggerate the deviations in empirical distribution of occupations from the ideal norm. Moreover in a stratified society the class factor must leave its impress upon its occupational structure. In addition to the fact that among individuals distribution of physical capacities and mental faculties is uneven the discovery, cultivation and development of such gifts are not equally available to all. Furthermore in so far as vocational training is a costly and long drawn out process, it sets up an obstacle to admission to an occupation which is almost as effective as a formal property qualification or the need of a capital fund at the start. If special training acts as a bar to free affiliation, reluctance to lose the advantages which it brings hinders free separation. It is a paradox of modern society, in which a considerable degree of occupational mobility is virtually indispensable, that most occupations require some special training and that a change of occupation necessarily entails individual sacrifice and social waste. It is not surprising that the workers in a particular occupation develop a spirit of exclusiveness and tend, where its growth is unchecked, to regard their job as a vested right to be passed on to newcomers only under certain specified conditions. These may be a long apprenticeship and a high initiation fee in the skilled trades, a special social background in some liberal professions and governmental services or simply contact with the right clique, a "pull," so often invaluable in securing appointment to the higher paid white collar jobs.

Racial and national differences also disturb normal occupational distribution. In some countries, for example, work is regarded as merely a tedious preliminary to a life of leisure supported by a fixed income from investment, while in others the inactive rentier is held in contempt. Similarly aliens have always tended to concentrate in pioneering occupations and thus to play an important part in revolutionizing economic practises and in building up new countries. The occupational distribution of the different ethnic strains in the United States illustrates the importance of the national factor, even where the assimilative force of the environment is at its highest; certain employments apparently attract, others repulse, a particular national or racial group, sometimes on economically rational grounds, in other cases because of a thinly disguised prejudice.

The assimilative capacity of modern society is greater with regard to occupational employment of women. The sexual barrier to occupation, one of the oldest and until recently the most impregnable, has been almost completely removed in modern society. What women's work lost in importance with the decline in the economic significance of the household it has regained since the emergence of industrial capitalism through the employment of women outside the home. While there is considerable difference among occupations in their actual accessibility to women and while the proportion of gainfully employed among women varies by countries, national groups and income classes, woman's occupational work is an essential, not easily dispensable, element in the modern economic order. At present formal limitations upon women's freedom of occupational choice have no quantitative importance; they are of recent origin and are based upon considerations of racial hygiene and social morality.

STATISTICS. Beginning in England with the pioneer efforts of Gregory King in 1688 and of Arthur Young in 1769, statistical work on occupations became more and more emancipated from the traditional conceptions of the natural, or "divine," class order and was eventually restricted to a purely descriptive, non-normative analysis of the economic and social composition of the population. The statistician simplified the concept of occupation for his purposes; this was based upon the increasing dominance of the income seeking element both in occupational affiliation and in occupational self-consciousness

and the changes in the methods and norms of taxation, all of which made for a practical synonymy between the categories of "occupation" and "source of income." Modern occupational statistics merely list the income yielding occupations of the individuals composing the population, often including the occupationless as well, and group them by geographical divisions and by industrial income sources, such as agriculture, trade, manufacturing, mining, public employment and the like. These statistics thus give a picture of the type of economy obtaining in the country—agrarian, industrial or rentier—and afford some notion of the comparative numerical strength of the labor and property income groups as well as of the types of occupations subsumed under these headings. It must be noted, however, that within these apparently objective groupings there are implied a variety of normative judgments as to the value of specific occupations, which account in part for the sharp controversy between statisticians as to the grouping of occupations and particularly as to the limits of "gainful activity." And the continual changes in methodology of occupational statistics from the time of the first official censuses undertaken at the turn of the nineteenth century in the large European countries and in the mid-nineteenth century in the United States reflect changes in social theory and social ideals no less than changes in occupational realities described. Even at present, despite fundamental similarity in the statistics of modern industrial countries, there are important differences in method which affect the results of occupational censuses.

One significant difference bears on the listing of secondary occupations in addition to the chief occupation, a practise followed by Germany since 1882 and by a few other countries. This method has several advantages: the limitation to a single occupation for money making purposes is more characteristic of the strictly handicraft organization of industry before the nineteenth century than of the fully developed capitalism of the twentieth century, which seeks to utilize every opportunity for gain and often results in a complex and changing occupational life for the worker. The inclusion of secondary occupations not only shows how large a portion of the population pursue several occupations but makes possible the adjustment for sources of errors in the statistics of chief occupations. It demonstrates, for instance, the extent to which seasonal occupations dovetail, a factor of elas-

tivity in the very important cross connections between agriculture and industry; and it affords some notion as to the degree of participation in agricultural work or in industrial homework of women and older children who are engaged in the main in the non-remunerative household activities. On the other hand, there are the risk of double counting and the fact that the cross sectional view of occupations made possible by single enumeration is disturbed.

Perhaps even more important are differences as to basis of inclusion in occupational statistics. Thus virtually all countries exclude such activities as the holding of honorary positions, amateur pursuits or professional crime. Furthermore in some countries the economic characteristics of an occupation are accorded much greater preponderance than in others. In the United States, for instance, only those who are gainfully employed are questioned as to their gainful occupation, whereas the German statistician leaves the whole question open by inquiring as to that "gainful activity upon which the position held in life and upon which in general total earnings, or their major portion, chiefly depend." It is to be noted also that the German occupational census, connected as it is with the general population census, embraces the total resident population without limitation as to age or occupational activity. Where the occupational census is taken separately, a minimum age limit is as a rule taken into account; this may be ten years as in the United States, England and Italy, fifteen years as in Norway or five years as in Egypt.

The strictness of the definition of occupation for census purposes is more important for the ratio of those with an occupation to those having none than for the total number of occupied. The residual group under "no occupation" (in German statistics the groups classed as "independent without occupation" and "dependent without chief occupation") is a carryall which embraces such diverse elements as rentiers, pensioners, unemployables of various descriptions—invalids, insane, prisoners—as well as students, inmates of social welfare institutions and the like. Nor is the composition of this group the same in every country: in Germany, for instance, the temporarily unemployed are listed according to the occupation in which they were formerly engaged, a practise which suggests that occupation consciousness is here stressed more than the income yield.

In connection with the relation between the

two major groups of those with and those without an occupation, a quantitatively important question arises with reference to housewives in the city as well as to married women and older daughters on farms. The problem here is not merely one of the number employed in the "housekeeping occupation"; it involves decision as to the value to be assigned to this occupation as compared with the various pursuits of women outside the home. The statistics of various countries have different ways of making it possible to ascertain the number while at the same time avoiding the other issue. In Germany, for example, where occupational statistics are based on household lists indicating the size of the household and the number of those dependent on the principal breadwinner, "married women without chief occupation" are registered separately from "other dependents"; the numerical value of the housekeeping group can therefore be derived if the number of "gainfully employed married women" is also taken into account. In other countries the statistics of marital condition admit of similar calculations. Far more difficult is the decision about unpaid housework often performed by adult daughters and about the role of "assisting dependents," especially in agriculture; here the devious ways in which the numbers are to be computed vary so much from country to country that international comparisons are scarcely possible.

Differences in practise as between countries and sometimes as between successive censuses in the same country relate not only to the inclusion of certain marginal cases and the amount of detailed information gathered but also to the classification and grouping of material. In this connection a distinction must be drawn between two fundamental criteria employed alternately or in a variety of combinations: one classification is that by industry, so that the primary grouping is by plants and branches of production with the social and economic status of the individual reflected only in the subdivisions indicating the position held in the plant; the other classification is that by individual activity with the primary grouping by occupation. Most countries do not follow either of these criteria exclusively, for they attempt to provide a statistical reflection of the dynamics of occupational differentiation in so far as it is possible to do so without radically impairing comparability with previous censuses. Many statistical offices, among them those of England and to some extent of the United States, Canada and the Union of South

Africa, tabulate the results of occupational censuses either by both industrial and occupational groupings or at least in such a way as to allow grouping according to both of these criteria. While the double tabulation is in many ways most appropriate for statistical purposes, it is superfluous in the case of such industries as agriculture, since the results are almost identical. Each grouping has its limitations. The organization by industries acquires real meaning only when there is a particularly close connection between the occupation and the industry; such connection was characteristic of the old handicraft system and is still typical of phases of modern industry which require a high degree of specialization. At present industrial grouping is therefore significant only for skilled workers, while for unskilled and semiskilled workers and clerical employees occupational grouping is the more suitable and often the only method which is technically possible. In those countries which carry out a comprehensive census of production simultaneously with the occupational census the grouping of occupations by industries would merely duplicate certain portions of the census of production.

A statistical picture of developments in occupational structure is available only for a comparatively short period; in no country does it go back farther than the middle of the last century. But even within this brief period changes in the methods of census taking and in its territorial scope where national frontiers were shifting make temporal comparisons troublesome. Much more difficult of course are international comparisons in which allowance must be made for disparity in methods, differences in the year and the season of census taking and the inequality in the time intervals between censuses, which are everywhere rather long (in France five years, in England and the United States ten years, in Germany in one case as long as eighteen years). However careful the adjusting calculations, the inferential value of such comparisons remains slight so long as the effects of seasonal and cyclical changes are not eliminated and the influence of a changing age composition of the population is not properly assessed. The numerical picture offered by such international comparisons, whether absolute or relative figures are employed, always suggests an unduly high degree of accuracy; while it is legitimate perhaps to interpret these figures as confirming conclusions regarding trends derived by other methods, it is hazardous to draw from them any new

inferences as to past developments or future possibilities unless they are supported by painstaking analysis of the history of these statistics and tally with other relevant information.

These general considerations explain why occupational statistics do not in themselves reflect clearly even such important and universal trends in the evolution of capitalism as the general intensification of economic activity, especially of its industrial branch. For example, in the four large industrial countries—the United States, England, France and Germany—the ratio of the occupied to the total population as shown in the following table has, with the possible exception of Germany, remained fairly constant during the last fifty years. Moreover even the relative rise in Germany would have been considerably less had the proportion been taken not of the total but of the employable (excluding children and old people) population, since the age composition of the German people changed radically between 1907 and 1925. Thus Zahn estimated for this period that the total population increased about 13.5 percent, the employable population about 26.4 percent and the employed population about 27.2 percent, so that the ratio of employed to employable increased only about 3 percent while the ratio of employed to total population rose by about 12 percent. This suggests that the extent of industrialization is perhaps more correctly revealed by changes in the absolute number of persons employed, especially since only a minute portion of the population increase finds employment in agriculture; in the four countries mentioned the agrarian population was in fact diminishing in absolute numbers. Account must be taken also of such decrease in the proportion of gainfully employed as is caused by the fact that the percentage of child and old age labor has diminished as a whole despite its increase in absolute numbers in some occupations. Finally, there must be noted an appreciable advance in the efficiency of industrial production, so that per capita output in these countries has grown more rapidly than the number of employed.

The pitfalls which are encountered when conclusions are based on such general figures are indicated in a consideration of the trend in the occupational activity of employed women. The abnormally high proportions for the United States in 1910 and for France in 1921 are due to changes in methods of census taking, especially as regards women on farms; and the 1925 percentage for Germany is explained in part by

GAINFULLY EMPLOYED IN RELATION TO TOTAL POPULATION IN PRINCIPAL INDUSTRIAL COUNTRIES, 1880-1930

		TOTAL POPULATION GAINFULLY EMPLOYED, 10 YEARS AND OVER (IN 1000)	TOTAL POPULATION 10 YEARS AND OVER (IN 1000)	PERCENTAGE OF TOTAL GAINFULLY EMPLOYED	FEMALES 10 YEARS AND OVER GAINFULLY EMPLOYED (IN 1000)	TOTAL FEMALES 10 YEARS AND OVER (IN 1000)	PERCENTAGE OF TOTAL GAINFULLY EMPLOYED

the surplus of women of working age, a consequence of the tremendous loss of men during the World War. Furthermore a comparison of pre-war and post-war percentages, especially for France, would seem to contradict the popular conception of the extent of the emancipation of women; this should serve as a reminder that in comparative occupational statistics more valuable inferences can be drawn from figures for each occupation than from summary data. Thus Duriac has shown for France that despite the slight decline in the total occupational activity of women from 1906 to 1926 their proportion in the group "trade, liberal professions and officials" rose for the same period from 13.9 to 18.9 percent; that is, by about 36 percent. The same holds true for the period 1910-30 in the United States. The slight decline indicated in the table obscures the fact that it was the result of opposing movements: the number of women engaged in agriculture fell off about 26 percent as contrasted with a decline for men of only about 6 percent, and in the manufacturing and mechanical industries the absolute number of employed women rose only about 9 percent while the total increase was about 34 percent; on the other hand, there was an increase for women of about 156 percent as compared with

39 percent for both sexes in transportation and communication and of 244 percent as against 141 percent in clerical occupations. In stenography and typewriting alone there were 775,000 women in 1930 as compared with 265,000 in 1910 and fewer than 1000 in 1870.

In an analysis of changes in industrial grouping of the employed population the most general trend to be observed, subject again to the limitations indicated above for the reliability of international occupational comparisons, is the continuing predominance of agriculture as the largest single branch of production. The number of persons employed in agriculture declined only in the United Kingdom, Germany, Belgium and the United States, while elsewhere the decline has been only relative; in other words, agricultural employment did not keep pace with population growth. It is impossible to measure definitely changes in the world situation, since no adequate figures are available for China and India; but it is safe to assume that as long as no radical transformations occur in these large agrarian regions, the relative importance of agriculture for the world as a whole cannot be seriously impaired.

The important change in those countries which passed through an industrial revolution

is the relative and absolute increase in the absorption capacity of industry as distinguished from agriculture. It must be noted, however, that since the end of the nineteenth century the rate of growth in the old industrial countries of Europe has declined both absolutely and in comparison with that of new countries. For a ten-year period, within the range of the varying census enumerations between 1907 and 1925, the increase in employment in industry and mining was 9.2 percent for England and Wales and 9.8 percent for Germany, as contrasted with 13.2 percent for Canada and 19.8 percent for the United States. Other "new" industrial territories which have outstripped the older European countries are Japan and British India. There is thus implied a narrowing of occupational opportunities in the regions of older civilization and a relative increase of occupational opportunities in new countries.

A more general and perhaps a more significant trend than this geographic shift of the center of industrial growth from Europe to oversea territories is the vertical shift in industry itself, from the heavy and raw material industries to the light and finished products industries. England as the oldest industrial country takes the lead in this process of industrial realignment. Its last census shows that in the period 1924-30 the number of persons employed in mining and quarrying decreased by about 21.1 percent, whereas the manufacturing group showed only a 3.5 percent loss. For England moreover due allowance must be made, first, for the sharp general decline in business and, second, for the very pronounced drop in the older industries manufacturing staples; thus employment in the textile industry dropped by about 17.8 percent, while employment in such industries as motor vehicles rose by 12 percent, printing, paper and stationery by 6.5 percent and timber by 13.8 percent.

Within the separate industries there is the characteristic shift from the occupations concerned with the manual productive operations to the supervisory and clerical occupations. This tendency toward "bureaucratization" applies not only to industrial production but also to all other occupational branches. In the United States, for example, in the period from 1870 to 1930, the proportion of those employed in the actual production of physical goods in agriculture, mining, manufacturing and construction declined from 75 percent of all employed persons to 50 percent. This drop, apparent in all

progressive industrial countries, is traceable not solely to technological progress and the resultant heightened efficiency of production; it has been accelerated by the fact that in the "aging" or "maturing" industrial countries the distributive and administrative apparatus grows faster than the number of persons employed in production. It may be established as a general rule that in the last decade production gained more in capital than in man power, whereas its distribution and administration, despite labor saving devices, absorbed a continually growing proportion of the total increase in the number of employed persons.

In view of the above considerations it need not appear paradoxical that the group whose relative increase is greatest is the one of independent persons without occupation. Before the World War this "occupational" category included predominantly investors, large and small; after the war, which impaired gravely the income basis of rentier existence, the majority in this group consisted of pensioners—war veterans, beneficiaries of invalidity, old age and unemployment insurance, retired officials and the like. The persistence of its growth despite so radical a change in the composition of this group suggests that it is the product of a characteristic tendency in capitalism: while capitalism superseded a social order in which the dominant class was economically inactive, in the course of its own development it tends to throw up an increasingly representative layer of people retired from active participation in occupational pursuits.

Even at their best statistics can scarcely undertake to describe fully the evolution in occupational structure. Besides quantitatively measurable changes the development of capitalism brought forth a series of qualitative changes which are too complex and ambiguous for statistical comprehension. The question, for example, as to whether industrialization has brought an increase in social security or whether, on the other hand, it has made possible a greater mobility as between the individual occupations or the social groups can be answered only superficially by statistics. The answer will depend upon whether individuals, whole occupational or social strata or a series of generations are considered; it cannot apply equally to individuals at the top of their occupation or to the upper groupings and to the broad base of the social pyramid. The experiences of the World War and the post-war periods would seem to

show that the security and stability of the class of industrial entrepreneurs were even less than is suggested by the adage "from shirtsleeves to shirtsleeves in three generations." But for the industrial proletariat, despite the adverse effects of depressions, a greater security has apparently been gained, as much through purely economic developments as through social legislation. To be sure, such gains are purchased at the cost of increasing immobility, with reference both to vertical movement in the direction of higher paid positions and to horizontal movement into other occupations at a similar wage. While the base of the social pyramid has been widening and its middle strata are still broad, the upper portions of the structure have become narrower as compared with the precapitalist or early capitalist periods. These tendencies, while simultaneous, point in opposite directions; the problem as to which is recognized as dominant is less a question of statistical manipulation than one of social philosophy.

A similar situation is encountered upon examination of the relation between service rendered, the social prestige of the service and its market price, a relation which is perhaps the best tangible measure of individual well being. It cannot be denied that in many occupations at present the three are not evenly balanced. Yet the question whether the discrepancies in the modern economic system are greater or less than in others must remain an ethical, meta-economic problem as long as economics fails to provide a simple formula for the "fair wage."

Nor is it possible to generalize concerning freedom of access to various occupations. Whereas a generation ago it was possible to believe that there was a straight line development from a rigidly stratified occupational organization bound by tradition toward a liberal-anarchic freedom of occupational choice, strong counter-tendencies have since become apparent. A number of occupational groups acting independently have introduced entrance qualifications or retained them from the handicraft period; in other occupations state examinations and licensing have barred free access to newcomers. The development of experimental psychology in the last decade suggests the possibility of a complete reversal of the earlier tendency. Under communism or Fascism it may lead to an authoritarian system of occupational distribution; and even in a democracy vocational guidance and mental testing point to a new fixing of occupational affiliation, distinguished by its "scientific

objectivity" from the traditionalism of the guild system and marked off from the collectivism of the communist or cooperative economic order by its emphasis upon benefit to the individual.

OCCUPATIONAL THERAPY. See REHABILITATION.

OCKHAM, WILLIAM OF (c. 1280-c. 1349), mediaeval scholastic. Although Ockham was born in Surrey and was an Oxfordian follower of Duns Scotus, he passed his later years on the continent. As a radical Franciscan, he espoused the cause of complete evangelical poverty as against his lifelong enemy, Pope John xxii. Allying himself with Emperor Louis of Bavaria, he wrote voluminous political polemics, upholding the complete independence of the empire and the national kingdoms from the papacy.

Ockham takes the nominalistic or terminalistic view that only particulars are real and that ideas, especially general ones, exist only as signs in the mind for objects which are in themselves unknowable. This theory stimulated a naturalistic skepticism or positivism which in turn led to either a complete or a partial divorce of theology from philosophy. Ockham himself always professed his orthodoxy but, radically distrusting reason, he disproved logically various fundamental religious doctrines, which he accepted on faith alone. This doctrine was revolutionary in that it led some thinkers completely to abandon dogmas they could no longer prove and others to make individual faith and conscience the sole measure of the truth inherent in the Scriptures. Ockham's skepticism thus indirectly prepared the ground for the Protestant revolt, a fact which was recognized by Luther and his followers.

Contrary to common belief, Ockham's political thought was not as radical in its implications as his philosophy. His distrust of reason and emphasis on will and belief led him at times to consider all law a mere product of God's will, in essence arbitrary and inscrutable. Ockham's purely political writings did not, however, break with the traditional belief in a universal rational law, as summarized by Aquinas. With classic subtlety he developed a theory of natural and divine law as rational, even though from God. Under this higher law he permitted varying degrees of adaptation of ideal norms to imperfect human circumstances. His *jus gentium* is

just such a variable natural law, closely resembling fundamental mediaeval custom. Ockham's sharp theory of the independence of temporal authority and his conciliar leanings undoubtedly contributed to the disruption of the mediaeval system of unity, the divorce of church and state and ultimate state omnipotence in law. But, subtler than his more Erastian successors, he always preserved a reasonable and relativistic tone. The highest political agencies, such as emperor, pope and general council, hold their restricted spheres of authority independently and from the higher law itself. Non-feasance or malfeasance alone justifies temporal interference in spiritual concerns, and vice versa. Only in such eventualities can one organ in the social body "replace" another. Ockham preserves a moderate constitutionalism, even in the midst of violent outbursts against a particular pope.

MAX A. SHEPARD

Important works: A list of Ockham's leading philosophical writings is found in Hauréau, Barthélemy, *Histoire de la philosophie scolastique*, 2 vols. (Paris 1872-80) vol. ii, pt. ii, p. 360-61. His important political works are published in *Monarchie S. Romani Imperii*, ed. by Melchior Goldast, 3 vols. (Hanover and Frankfurt 1611-14) vol. ii, p. 313-1236; his *De imperatorum et pontificum potestate* has been edited, with an introduction by C. Kenneth Brampton (Oxford 1927).

O'CONNELL, DANIEL (1775-1847), Irish statesman. Driven into the glens of Kerry by Cromwell's persecution of Irish Catholics, the O'Connell family became deeply involved in illegal relations with France. Daniel's uncle, a general of the Irish Brigade in France, had his nephews educated at Saint-Omer until the religious colleges were confiscated in the French Revolution. Returning to Ireland Daniel O'Connell began the study of law. As a result of certain concessions which the British government had granted to Irish and English Catholics during the period of revolutionary excitement he was able to enter the legal profession. He became a barrister in Dublin in 1798 and at a lawyers' meeting shortly afterward opposed the

Act of Union. Pitt's promise to admit Catholics to Parliament as part of the union settlement was unfulfilled, and O'Connell soon led the young lawyers in reviving the Irish Catholic Committee. His matchless gifts as lawyer and orator made him the leading junior barrister, but his religious affiliations precluded all chance of promotion. His courage and energy galvanized the Catholic Committee into a great national agitation, and by 1813 the British Parliament was willing to grant emancipation in return for a veto on the choice of Catholic bishops. But O'Connell's religious scruples made him oppose that compromise and his agitation collapsed. He could not revive it until 1823, when he organized the Catholic Association on a new and fully democratic basis. His ingenuity defeated all efforts to suppress the association and in 1828 he was triumphantly elected for Clare, pledged not to sit in Parliament until the anti-Catholic oath was repealed. Fearing civil war the duke of Wellington gave way and passed the Emancipation Act of 1829. O'Connell had become the pioneer of modern popular agitation on strictly constitutional lines and his prestige was immense. In England he helped in carrying the Reform Act of 1832, and in spite of his conservative sympathies he became a close ally of the Radicals. His later years were devoted entirely to repeal of the Act of Union. He repeated on a larger scale the methods of his Catholic agitation, but his moderation when confronted with the British government's final threat of force destroyed his hold over his more impatient followers. He died broken hearted during the third year of the Irish famine.

O'CONNOR, FEARGUS (1794-1855), British social reformer. O'Connor, the son of Roger O'Connor, an Irish nationalist, made his entrance into politics under the wing of Daniel O'Connell. In 1832 he was returned to Parliament for his native county of Cork. After quarreling with O'Connell, as he was destined to quarrel in turn with every political associate, he

was unseated on petition in 1835. Thereafter he transferred his attention from the woes of Ireland to the broader field of radical reform in Great Britain. As editor and owner of the *North-ern Star* (1837-52) and member of the National Charter Association he managed to become the outstanding journalist and most conspicuous leader of Chartism (*q.v.*). Under his leadership the whole movement became bound up with an ill conceived scheme for purchasing rural homes for the working class. The Chartist Land Co-operative Society launched with this object in 1845 was succeeded by the Chartist Co-operative Land Company in 1846 and the next year became the National Land Company. Following an investigation by a select committee of the House of Commons, the National Land Company had to be abandoned in 1848, although the committee found that the errors in O'Connor's accounts were to his own disadvantage. In 1847 he was elected to Parliament from Nottingham and the following year presented the last and most famous of the great Chartist petitions. From that time onward his influence within the party and with the working class at large rapidly declined. A violent outbreak of insanity terminated his political career in 1852.

It is vain to seek for any consistency in O'Connor's character, career or political philosophy. He was a man of commanding presence and one of the most effective of mob orators, and there is no reason to doubt his earnestness in advocating reform. On the whole, however, he injured the Chartist cause by alienating all Chartists, including the followers of Lovett and the other protagonists of "moral force," who were not content to be blind O'Connorites. Although commonly accounted the spokesman of "physical force" Chartism and twice prosecuted for sedition, he counseled moderation in the crises of 1839, 1842 and 1848, the three occasions when Chartist agitation really threatened to become revolutionary. While he advocated class consciousness with all the fervor of a Marxian and abjured any rapprochement with middle class radicalism, as represented, for instance, by the Anti-Corn Law League, he never embraced the socialistic tenets of other radical Chartist leaders, such as Ernest Jones and James Bronterre O'Brien, but looked to peasant proprietorship as the solution of the problem of poverty.

ODGER, GEORGE (1820-77), English labor leader. Odger was a member of a London society of shoemakers and in the 1850's he became prominent by promoting federations and amalgamations among trade unions. He was one of the organizers of the London Trades Council and was its secretary and most influential member from 1862 to 1872. Odger was one of the junta who conducted the successful campaign for the legalization of trade unions and in 1872 was on the Parliamentary Committee of the Trades Union Congress.

Politically Odger's influence served to enlarge the views of working men beyond the confines of trade union interests. His oratorical skill, informed views and unquestioned loyalty made him a power among them. As an official of the Reform League he was instrumental in the enfranchisement of urban workers and thereafter advocated unremittingly the direct representation of labor, urging the policy upon the Trades Union Congress and participating in the work of the Labour Representation League. Five times he sought unsuccessfully to enter Parliament upon a Radical program; he actually went to the polls only in 1870 and 1874 at Southwark, where he was opposed by the official Liberals.

Odger never subscribed to middle class doctrines as fully as did most contemporary labor leaders. He continued to work at his trade and never lost touch with the workers. He was one of the founders of the First International and served as president of its council until 1871. He was a founder of a Land and Labour League advocating the nationalization of land and bank-note issue and he openly advocated republican government for England. In 1867 he helped form an International League of Peace and Liberty.

ODO OF CLUNY. See CLUNIAC MOVEMENT.

OGILVIE, WILLIAM (1736-1819), Scottish land reformer. Ogilvie studied at the universities of Glasgow and Edinburgh under Adam Smith and Adam Ferguson and was finally appointed to the chair of humanity in King's College, Aberdeen. His *Essay on the Right of Property in Land* (published anonymously, probably in Aberdeen c. 1782) shows the influence of his great teachers and of the French physiocrats as well as of the humanitarian spirit of his age; explicitly its ideas are grounded on the natural law doctrine concerning common possession of the land and on Locke's value theory concerning labor as the true title to property. Stigmatizing land monopoly as the main cause of the misery and servitude of the masses, he distinguishes between three types of land value: the original value, or what Ricardo later characterized as "the original and indestructible powers of the soil"; the improved value due to cultivation; and the improvable value, or what subsequent reformers called the "unearned increment." While he favored the private right to the improved value as essential to the prosperity of agriculture, which he considered the main source of the wealth and strength of nations, he claimed that a share in the original value and in the potential increment was by natural law the birthright of every individual.

As a practical reformer Ogilvie, who was firmly convinced of the dangers of sudden change, followed the example of Locke and other natural law theorists in compromising between norm and actual conditions. Instead of demanding expropriation of the landowners, as did his contemporary Thomas Spence, he would merely have required them to let to every unpropertied family a farm of at least forty acres at a rental fixed by arbitrators; in order to avoid a break with tradition he would even have compelled the tenants to give the landowners "certain aids and services of a feudal nature." He proposed also that all governmental expenses be defrayed by a single tax upon those portions of the land values which by natural law belonged to the community. For the execution of these reforms Ogilvie looked to the voluntary action of enlightened governments and with this expectation sent copies of his tract to George Washington and to Frederick the Great. The

Essay was reprinted by the Chartists (London 1838), who were influenced by it in the formulation of their plans for agrarian reform.

OIL INDUSTRY. The oil industry, distinctive among industrial activities in the extent to which it represents a nearly self-contained economic entity, involves the production, transportation, refining and marketing of petroleum and its products. It is today one of the major industries of the United States, ranking next to agriculture, railway transportation and the power and light industry on the basis of capital invested; in 1929 oil refining ranked fifth in value of output among manufacturing industries. The United States until the end of 1932 produced 65 percent of the world's total output of crude petroleum and was credited in that year with 59.9 percent of the current world production, in addition there are large American interests in the oil industries of other countries. The oil industry is world wide in scope and transcends the principles of nationalism in its pervasive economic significance. Petroleum is the only commercially important source of gasoline, without which the spectacular development of the motor driven vehicle would have been impossible; it has become the major source of lubricants, without which the wheels of industry literally could not turn; it is the sole source of kerosene, which outside of the industrial and urban areas of the world still remains the most important illuminant; and, finally, in certain areas and for certain uses, as a source of fuel oil it has supplanted coal in the generating of power and heat. Nor are the uses of petroleum limited to those of its four major products; a host of minor products, including carbon black, commercial solvents, paraffin wax, medicinal oils, insecticides, asphalt and road oil, enter into commerce and industry in a multiplicity of ways.

The rise of petroleum to such eminence has taken place largely in the last quarter century, although the existence of petroleum has been recognized since the dawn of history. That primitive man may have used it in his boat building operations is a matter of conjecture; that his more civilized descendants utilized it in their construction activities is a matter of archaeological record. Modern excavations in

Assyria and Babylonia have disclosed fragments of bricks with a petroleum base asphalt clinging to them; water tight cisterns, the walls of which have been coated with a similar material, also have been unearthed. An early trade in petroleum is described by Herodotus and by Pliny. Petroleum played a role in the pharmacopoeia of the ancient Chinese, who considered it valuable because of its curative qualities. In mediaeval Europe *oleum petrae*, or rock oil, was likewise devoted to medicinal uses, and it is believed that before the coming of the white man the Indians in North America turned petroleum to similar account. Until modern times, however, it was of only minor and intermittent importance. Originally petroleum was secured chiefly from natural seepages and at a later date from hand dug wells; the latter method was in full operation in Burma probably as early as the middle of the eighteenth century. The oil lamp of Argand, invented in 1784, afforded a great stimulus to the demand for oil for illuminating purposes. After 1850, when James Young patented a process for extracting oil from shale and coal, distillation plants for the production of illuminating oil from oil shale or cannel coal increased rapidly in number in both the United States and England, and illuminating oil quickly supplanted whale and lard oils for lighting purposes.

As the American market for 'coal oil' broadened, the attention of capitalists was inevitably drawn to the oil seepages of western Pennsylvania as possible sources of illuminating oil. In 1857 the Pennsylvania Rock-Oil Company was organized for the purpose of exploiting these deposits. Although the initial efforts of this organization were commercially unsuccessful, in August, 1859, the first commercial oil well in America, the Drake well, was carried to successful completion; it yielded about 1000 gallons of oil a day at the outset, and during the remainder of the year it produced a total of 2000 barrels. A price of \$20 per barrel for oil created an oil boom comparable to the gold rush of 1849; in 1861, 2,114,000 barrels of oil were produced. At first it was the increasing demand for a high grade illuminant that supplied the major urge to oil production. In the distillation of crude petroleum, however, lubricating oils were obtained as a joint product and were introduced in competition with the established lubricants, animal and vegetable oils. With the rapid introduction of better methods of lubrication and of machine bearings of improved design during the

last two decades of the nineteenth century, mineral oil came to be recognized as a superior lubricant and contributed to the development of machinery of far greater precision and efficiency than would otherwise have been possible.

Although a world market for petroleum products quickly developed, the United States produced at least 90 percent of the world's annual output until 1875. Thereafter Russian output from the Caspian Sea region mounted steadily, surpassing American output from 1898 to 1901, when it reached its peak before the World War of 85,000,000 barrels, compared with an American output of 69,000,000 barrels. The United States and Russia at this time produced over 92 percent of the world's oil. By 1911 the world output had risen to 344,361,000 barrels (compared with 5,730,000 barrels in 1871), of which 220,449,000 were produced in the United States and 66,184,000 in Russia. The balance was supplied largely by India, the Dutch East Indies and Rumania, all of which have since remained important producers.

As the number of registered motor vehicles in the United States increased from 4 in 1895 to 26,500,000 in 1929, the output of crude petroleum in the United States increased from 52,892,000 barrels to more than 1,000,000,000. The value of refined petroleum products rose from \$123,000,000 in 1899 to \$1,793,000,000 in 1923 and to \$2,611,000,000 in 1929, the great increase being due mainly to gasoline consumption by automobiles. In 1899 the output of gasoline in the United States represented only 12.8 percent of the crude petroleum run to the stills, while kerosene represented 57.7 percent; by 1929 kerosene amounted to only 5.7 percent and gasoline to 44 percent.

With expansion in the output of petroleum and its products the technique of oil finding and of oil recovery improved greatly. The search for oil was at first a highly speculative affair; chance played the major role. The science of geology, reenforced by physics and chemistry, relieved oil discovery of much of its speculative character and brought it within the sphere of scientific engineering. By a careful mapping of surface structures, supplemented by the records revealed by the diamond core drill, favorable localities for the accumulation of oil can readily be determined. The judgment of the geologists is now buttressed by the work of the geophysicists. As petroliferous regions have been delimited with greater accuracy, improvements in

the technique of drilling have made it possible to recover oil from greater depths. The Drake well was drilled to a depth of 69 feet by means of crude percussion tools. Vast improvements in the cable or percussion method of drilling made it possible, by the close of the World War, for wells to be drilled to a depth of several thousand feet; in the last ten years even more marked improvements in drilling technique, including the use of stronger and more efficient materials and the general replacement of the standard or percussion tool by the rotary type of drill, have resulted in numerous wells producing at depths of more than a mile and some at more than 9000 feet. Oil recovery methods have shown a similar advance. Through repressuring with air or gas or through water flooding fields long since regarded as approaching exhaustion have been made to yield increasing quantities of oil. In those more recently discovered, the function of gas and water pressure as expulsive agents in oil recovery having come to be more thoroughly understood, output has been increased and the life of the field greatly prolonged. These various influences are reflected in a growth in average daily production per well in the United States from 4.9 barrels in 1921 to 8.4 barrels in 1929.

Once an oil bearing region has been discovered, production is effected by the drilling of a hole which taps the underground oil, found at varying depths in sedimentary rocks. Since the oil distributed in the voids, or pores, of the underground rocks generally exists in intimate association with natural gas or water under great pressure, these natural expulsive agents serve to bring it to the surface, frequently in tens of thousands of barrels daily from a single well. When the natural pressure has been exhausted, production is customarily carried on through pumping devices or artificial repressuring. Oil production in the United States, by reason of the character of the property laws, the nature of the physical occurrence of oil and the limitations of science in locating oil producing areas precisely and unequivocally prior to check by actual drilling, has remained a highly competitive enterprise. Despite a practical monopoly of oil transportation, refining and marketing the Standard Oil trust, before its legal dissolution in 1911, at no time had direct control of domestic production exceeding 33.5 percent, a figure attained in 1898, and by 1906 its control had declined to 11 percent. According to figures of the Federal Trade Commission, the segregated Standard Oil companies produced in the aggregate 24 percent

of the total American output in 1926; three foreign controlled companies 6.7 percent; and twenty-nine independent companies 32.4 percent. The balance of 36.9 percent was distributed among a multiplicity of smaller concerns or individuals. Production in foreign countries, by reason of the larger volume of capital required in prospecting and developing and of the system of property rights and governmental concessions under which oil is exploited, is generally concentrated in the hands of a few large, integrated companies. The most noteworthy exceptions to this generalization are afforded by Rumania, where control is rather widely disseminated, and by Soviet Russia, where production is carried on as a state monopoly.

The oil industry has developed a remarkable system of transportation based on the liquidity of the crude product. The system comprises an extensive network of gathering and trunk pipe lines through which the oil is pumped, supplemented by specially designed tank steamers for coastwise and ocean traffic and tank cars for railway traffic; as a result there has been a partial shift of refining activities from the producing areas to population centers or to areas adjacent to cheap water transportation. Pipe line transportation, essentially a large scale industry necessitating a relatively large fixed investment, is subject to the economic principle of decreasing cost and partakes therefore of the character of a "natural" monopoly. In recognition of this fact and of the tremendous disadvantage at which an independent refinery is placed when denied access to pipe line facilities, the Congress of the United States in 1906 imposed the obligation of common carriers upon pipe lines handling an interstate traffic in crude petroleum. Although the major American pipe line companies are organized as separate corporate entities and are at law common carriers, in reality they function primarily as transportation units of the large, highly integrated oil companies with which they are affiliated or to which they belong. Similarly in other countries the major oil producers own their own pipe line facilities, either directly or through subsidiary or affiliated concerns.

The refining of petroleum into its various commercial products is essentially a distillation process involving the principle of joint production, two or more products being necessarily obtained from a single refining process. On a basis of the range of products fabricated and the

extent to which distillation is carried, petroleum refineries may be classified into three main types: skimming, or topping, plants; complete refineries of the straight run type; and complete refineries employing the cracking process. Skimming plants utilize a simple distillation process, topping the crude oil of its more volatile fractions, gasoline and kerosene, and leaving a residue of gas or fuel oil. Complete refineries of the straight run type carry the distillation process further, turning out the whole range of petroleum products from gasoline to lubricants with a paraffin or asphalt residue. The residue of the skimming plants, gas or fuel oil, becomes the raw material of the cracking plants, where the heavy oils are subjected to steam distillation under pressure and are broken down into lighter components to yield additional gasoline. As the automobile has come into widespread use, the trend of refining practice has been toward a more extensive utilization of cracking stills. It was largely this development which made possible the increase in the percentage of gasoline yield from all crude oil run to American stills from 18.6 percent in 1914 to 44 percent in 1929 (Table 1).

TABLE 1

PRODUCTION OF THE PRINCIPAL PETROLEUM PRODUCTS
IN THE UNITED STATES, 1899-1929

YEAR	GASOLINE		KEROSENE		LUBRICATING OILS		GAS AND FUEL OILS	
	IN 1,000,000 BARRELS	PERCENTAGE OF TOTAL PRODUCTS	IN 1,000,000 BARRELS	PERCENTAGE OF TOTAL PRODUCTS	IN 1,000,000 BARRELS	PERCENTAGE OF TOTAL PRODUCTS	IN 1,000,000 BARRELS	PERCENTAGE OF TOTAL PRODUCTS
1899	6.7	12.8	30.0	57.7	4.0	7.7	7.3	13.9
1904	6.9	10.3	32.3	48.2	7.5	11.2	8.6	12.8
1909	12.9	10.6	39.9	33.0	12.8	10.5	40.5	39.4
1914	35.7	18.6	46.1	24.0	12.3	6.4	88.9	46.4
1919	94.2	26.0	55.8	15.4	20.2	5.5	181.6	50.2
1924	213.3	33.1	60.0	9.3	27.5	4.3	320.5	49.8
1929	435.1	44.0	55.9	5.7	34.4	3.5	448.9	45.5

Source: For 1899-1914: adapted from United States, Bureau of the Census, *Census of Manufactures, 1914* (1919) vol. II, p. 582. For 1919-29: United States, Bureau of Mines, *Mineral Resources of the United States* for 1921, 1924 and 1929.

The recent utilization of pipe lines for the transportation of gasoline has interrupted the tendency for refineries to be concentrated near population centers. Thus the refineries of the Tulsa, Oklahoma, district are now supplying gasoline by pipe line to Chicago and its environs. Foreign refining centers of major importance are still to be found near the major oil

producing regions, as, for example, Baku in the Soviet Union, Tampico in Mexico, Ploesti in Rumania, the Dutch East Indies and the island of Curaçao in the Dutch West Indies off the coast of Venezuela. Capitalizing its strategic location for the distribution of oil products to countries adjacent to the Atlantic and for the diversion of its products from market to market as political and economic factors may dictate, Curaçao now has two of the largest and most modern refineries in the world. With a view to greater economic independence and by means of tariff preferences, the industrial countries of western Europe which lack adequate crude oil supplies have expanded their refining capacity considerably in recent years. France, less successful than the United States or Great Britain in the world struggle for control of oil producing properties, through a system of import licenses and tariff preferences has campaigned aggressively and largely successfully for a self-sufficient domestic refining system. In general, however, oil producing countries remain the most important centers of crude oil refining.

The distribution and wholesale marketing of petroleum and its products are mainly under the control of a relatively few large, integrated companies engaging also in production, transportation and refining. In the United States, where the number of independent producers is relatively large, the integrated concerns through specialized purchasing companies buy the crude petroleum in the fields at posted prices and deliver it to the refineries of affiliated concerns. Small independent refineries purchase direct from producers in the field or occasionally have their own source of crude production. From the refineries gasoline is distributed customarily by pipe line, tank car or tank truck to some 23,000 bulk tank stations and other wholesale establishments. In 1928, according to the Federal Trade Commission, from 75 to 85 percent of the gasoline consumed in the United States was sold to the retailer or ultimate consumer by the refining company or by an affiliate. While the wholesale marketing of gasoline is concentrated largely in the hands of integrated companies, control of retail outlets is widely disseminated. Because of the relatively slight capital investment required to establish a filling station or install gasoline pumps and because the large oil companies in a bitter struggle to increase sales have followed the practice of leasing pumps and other service station equipment for a nominal rental, the number of retail outlets for gasoline

has increased at a rapid pace and the retail distribution of gasoline has been characterized by needless waste and duplication evident even to the casual observer. The common custom of locating competing service stations on opposite corners of the same street may have contributed somewhat to the convenience of a multitude of customers, ignorant both of the technical specifications of the gasoline they buy and the requirements of the motors they use, but led through competitive advertising and ballyhoo to believe in the superiority of a gasoline sold under a particular trade name. At the same time the situation has made for inefficiency in the marketing of gasoline and has increased greatly the cost of distribution. Such waste cannot be reduced to precise terms. Of interest, however, is the fact that according to the census there were in the United States in 1929 some 318,000 retail outlets for gasoline, or an average of one to every 83 registered motor vehicles. Of this total 121,513, or 38.5 percent, were filling stations; the balance were garages, automobile dealers and retail distributors, including hardware, drug, furniture and grocery stores, and restaurants. The number of filling stations in operation has continued to increase despite the depression.

The marketing of kerosene is more or less like that of gasoline, although the service station plays a relatively unimportant and the retail store a more important role in its distribution. Fuel oil is distributed somewhat differently from gasoline or kerosene, being sold in bulk for the most part under direct consignment from the refinery to the consumers, chief among which are industrial establishments, railroads and steamships. Lubricants, which are specialized products designed to meet the individual needs of particular machines, present a third type of marketing; they are distributed in part through service stations, garages and retail stores and are also sold direct to industrial establishments. The large, integrated companies handle the bulk of the traffic, although numerous independents by advertising a "quality" product have built up a considerable business in lubricating oils and greases.

The American oil industry in its early stages was a highly competitive enterprise, subjected by the character of oil recovery to recurring periods of overproduction and underproduction with correspondingly marked changes in the price of crude oil and its major refined products. In 1861, with a total domestic output of 2,114,000 barrels, oil at the well in December brought

only \$0.10 a barrel compared with \$20 a barrel two years previously. During the next decade as oil output increased prices showed similar but less marked fluctuations. The confusion engendered by such price gyrations was a contributing factor in the development of concentration of control. The Standard Oil Company of Ohio, the outgrowth of a small Cleveland refining company, backed by John D. Rockefeller and his associates, was incorporated in 1870 with a capitalization of \$1,000,000. So effectively was the policy of consolidation and expansion executed that by 1879 the Standard interests were refining 90 percent of the total petroleum products of the country, controlled 80 percent of the pipe line transportation service and dominated the field of marketing. In that year the Standard Oil trust, reorganized in 1882, was created. It represented a substantial monopoly in the purchase, transportation, refining and marketing of oil and its products. In the creation and maintenance of this monopoly the Standard interests resorted to a variety of practices which, while in keeping with the contemporary morality of big business, were offensive to the principles of competition, adverse to the interests of independent concerns and anathema to a public suspicious of a growing concentration of wealth. Chief among these practices were the surreptitious surveillance of the activities of its competitors, local price cutting, selling below cost, securing of secret rebates and preferences from railway carriers, operation of bogus independents and the like. Although such practices were important in creating the monopoly power of the trust, superior business ability and the economics of large scale operations were contributing factors. The most important single influence, however, was the advantage which the Standard enjoyed in transportation through rate discrimination, an advantage subsequently enhanced by control of the major pipe lines of the country.

This monopoly power, illegal both at common law and after 1890 by statutory enactment, inevitably proved a target for court attack. In May, 1911, after a prolonged period of recurring investigation and prosecution the Supreme Court of the United States held that the Standard Oil Company of New Jersey, which after 1899 as a holding company was the instrumentality by which the Rockefeller interests exercised control, was an illegal combination in violation of the Sherman Anti-Trust Act and ordered its dissolution. The dissolution did not immediately change the competitive situation,

although it did create a legal and business environment in which an independent oil industry could in time develop. Failure to establish genuinely competitive conditions within the industry was occasioned by the form of the dissolution. The stock of the thirty-three subsidiary concerns against which the dissolution decree was directed was distributed on a ratable basis among the holders of stock in the parent organization, which established a community of interest among the constituent concerns prejudicial to competition. Nevertheless, the court's decision banned unfair competitive practices and permitted independent capital to gain a foothold. New capital flowed into the industry following the tremendous expansion in output and a shift in territorial centers of production.

Meanwhile economic factors, seriously disturbing the interdependence which existed among the constituents of the Standard Oil trust, have contributed toward an end which legal factors alone were unable to achieve—the disintegration of the old Standard organization. When the dissolution was ordered, a noteworthy characteristic of the Standard Oil Company was the specialization of activities of the various constituents. Production, transportation, refining and marketing were conducted for the most part by separate business units, each specializing in a single activity and all integrated through common ownership and control. Subsequent to the dissolution this integration was maintained for more than a decade by an undisturbed community of interest, the dissolved companies continuing to perform their former specialized functions. The fear of a shortage of petroleum occasioned by an inroad on stocks from 1915 to 1918 to meet the unusual war demands served to initiate a movement toward a more stable integration. Individual Standard companies specializing in refining and marketing, fearful of the loss of a dependable source of supply of their crude product, endeavored to fortify their future position by the acquisition of companies controlling producing properties. Other Standard companies, confronted with the loss of their customary source of outlet, carried the integration process forward by acquiring control over refining and distributing properties. A surplus of oil throughout the decade of the 1920's, occasioning instability of the price structure, contributed likewise to further acquisitions, reorganizations and new alignments by various Standard companies in an effort to bulwark their position in an increasingly competitive

market. As a result various Standard companies, despite a continued though less marked community of ownership, have broken through the old geographic and economic bounds to their customary activities and now compete in both the purchase of crude oil and the marketing of refined products. Achieved for the most part by the acquisition of independent properties, integration has been attained in at least one significant instance by a consolidation of two of the major Standard companies. In 1931, after the United States District Court for Eastern Missouri held that the proposed merger was for the purpose of meeting the business necessities of the two companies and would not constitute a violation of the dissolution decree, the Standard Oil Company of New York and the Vacuum Oil Company were brought under the common control of the newly organized Socony-Vacuum Corporation. The new concern forms a completely integrated unit operating on a world wide basis and meeting the competition of other Standard companies at dozens of points. So far had this movement gone that by 1933 eight of the Standard companies against which the dissolution decree had been directed had been transformed from highly specialized concerns operating on a monopolistic basis within a limited geographic area to fully integrated concerns meeting the competition of other Standard companies over a broad territory.

In the course of these developments independent oil companies have grown numerous and strong. Each of nine fully integrated independent companies does a marketing business in at least seventeen different states. Two of these companies cover the entire United States in their distribution activities and three of them operate over broader domestic territory than any single Standard company. Whereas in 1904 the Standard Oil Company refined 87 percent of the highly refined products entering into trade, in the first half of 1926, according to the Federal Trade Commission, sixteen integrated Standard companies produced 37.7 percent of the gasoline refined in the United States, thirty integrated independents 38.2 percent, numerous relatively small, independent refiners the balance of 24.1 percent. From 1896 to 1906 the Standard Oil Company of New Jersey directly or through its subsidiaries marketed from 85 to 90 percent of the total refined products; in 1926 eleven Standard companies together with their affiliates marketed 44.85 percent, eight independent companies 29.92 percent and a large

number of smaller concerns the balance of 25.23 percent. Although there has been some decentralization of control of pipe line mileage, it has not proceeded so far as in refining and marketing and the trend has been reversed during the last decade; the Standard companies in 1926 controlled 72.9 percent of the mileage of pipe lines handling an interstate traffic.

Despite the increasingly competitive nature of the industry, however, prices have not been genuinely competitive. A brief analysis of the geological, legal and economic characteristics of oil production will contribute toward an understanding of this fact. When a pool is tapped the oil, actuated by gas or water pressure, is forced to the earth's surface, frequently in tremendous volumes. Oil moves toward the surface obviously without regard to property lines or individual surface ownership. Under the property laws of the various states of the United States owners over a common pool may take and keep all the oil and gas which are recovered from their wells regardless of the fact that the oil may be drained from adjoining properties or that the flow of one well may diminish the flow from another. Although in a few recent court decisions the correlative character of the ownership of the underground oil and gas by a group of surface landowners has been recognized, in general the only protection which the courts have offered the landowners against drainage by competitors has been contained in the simple admonition, "Go, and do the same." In brief, oil production has been conducted on the principles of robbery.

From these geological and legal characteristics the economic peculiarities of oil production arise. Not until an area has been tapped by the drill can its oil potentialities definitely be determined. Despite the fact that large companies have come to place great reliance upon the services of trained geologists and petroleum engineers, the lure of speculative profits has made the oil wildcatter a dramatically disturbing element. Although the activities of wildcatters may be encouraged or restrained by the price of petroleum, the economic outcome of their endeavors remains a matter of indeterminable chance. Speculation, then, plays the major role in creating capacity. In the light of the present legal system moreover the competitive exploitation of an oil pool necessitates its being developed as rapidly as possible. Protective competitive drilling forces an increase in capacity irrespective of the economic condition of the

industry. Finally, once capacity has been called into existence, it is driven into complete utilization by competitive forces. Oil production is an industry of relatively large fixed costs, representing a highly specialized investment, absorbed mainly in drilling, which can be neither withdrawn nor used for any other purpose. Under competitive exploitation of a pool this economic fact, coupled with the geological and legal character of oil recovery, calls for production at maximum well capacity, irrespective of the price of oil. Any return on the investment is better than none. Curtailment of output by an operator in anticipation of a better price is for the benefit of a competitor who reduces the migratory oil to possession.

These economic characteristics of oil production together with concentration of control in transportation and refining have, paradoxically, made the so-called independent producers peculiarly dependent upon the large, integrated concerns, which have been the chief purchasers, storers and refiners of crude oil. Their control of pipe lines has given them an influence on oil prices disproportionate to the statistical position which they occupy in the industry. Although interstate pipe lines as common carriers make shipments for outsiders, they function primarily as agents of the large, integrated concerns of which they constitute a unit. The requirement of large minimum shipments has contributed to making pipe lines unavailable for small shippers. The unintegrated, independent producers, unable under the stress of competitive production to restrain their output at will and confronted not infrequently by a buyers' monopoly, have not always been insured a so-called competitive price for their product. Nor has the consumer since the breakdown of the Standard monopoly always had the benefits of competition in the sale of petroleum products, especially in the case of gasoline. The demand for gasoline, derived from a demand for motor transportation is less apt to be affected by its own price than by factors exterior to the industry, such as the condition of roads, the state of the automobile market, the general distribution of purchasing power and the customary habits of the populace. The large companies have thus been encouraged to follow a common price policy, not infrequently through collusive action, and to resort to competitive advertising and service competition rather than price competition.

Despite these restraints upon competition a growing output of oil during the past decade

has made the problem of price stabilization increasingly difficult. Numerous small, independent refineries have sprung up in the vicinity of flush oil production and have disposed of their products through new and independent outlets. They have refused to follow the price lead of the large companies, and the price trend for both crude and refined products has generally been downward. This trend has been accentuated at times by price cutting, and price wars have been frequent.

Profits in the oil industry, particularly before the dissolution of the Standard Oil Company, have been large. The federal government's investigation of the Standard Oil Company prior to the dissolution decree of 1911 revealed that during the twenty-five years from 1882 to 1906 inclusive the dividend rate on capital stock, which was \$14,289,301 in excess of the actual value of the property in 1882 as estimated by the trust itself, increased from 5.25 percent to a maximum of 48 percent, the ten-year average rate from 1897 to 1906 being approximately 40 percent. Total net earnings as related to capital stock rose during the same period from 17.4 percent to 84.5 percent; the average from 1882 to 1891 was 16.1 percent, from 1892 to 1899, 32.2 percent and from 1900 to 1906, 66 percent. A large portion of net earnings was reinvested in extensions, enlargements and other improvements incidental to normal growth of the oil industry subsequent to the establishment of the monopoly. The annual mean of assets advanced from \$60,516,000 in 1882 to \$337,506,000 in 1906. Notwithstanding this large increase in the value of Standard Oil holdings represented by reinvested surplus the rate of earnings on assets showed a substantial gain. The average annual rate of net earnings to assets for the first decade of the trust's existence was 15.1 percent; it rose to 21.1 percent in the following eight years and to 25.2 percent in 1901-06. The rate of earnings since dissolution, particularly during the post-war period, has not been so large; nevertheless, as judged by available data, it has been high. According to Federal Trade Commission data covering 77 to 90 companies, which in 1925 produced 14.9 percent of the American output of crude oil, the annual rate of return on investment (capital stock, surplus, reserves appropriated from surplus and long term borrowings, less discovery value and other appreciation and outside investments) averaged from 5.9 percent in 1922 to 18.6 percent in 1925, or an average annual rate of approximately 10.4 percent. In

1925, 63 refining and producing companies with 33 percent of the crude output and more than 81 percent of the refined output showed a rate of return of 11.1 percent. Over the four-year period 1922-25 producing and refining companies showed an average annual rate of return of 8.75 percent. The profits of pipe line companies were even higher; according to a recent report submitted to the Seventy-second Congress, 2nd session (House Report no. 2192), from 33 to 51 pipe line companies reporting to the Interstate Commerce Commission showed an average annual return on net investment ranging from 20.5 percent in 1923 to 30.7 percent in 1929, or an average annual rate of 25.4 percent.

While concentration of control, despite its failure to stabilize price, has had considerable influence of an artificial sort, which is reflected in the data on earnings, it has been less successful in the elimination of waste in oil production. Competitive exploitation of oil pools has resulted in inefficient utilization of natural pressures, waste of the natural gas which accompanies oil output, choking of underground pools through premature encroachment of salt water, needless expenditure of capital and labor through the drilling of an excessive number of wells and recurring overproduction. The decade following the World War was characterized by an almost uninterrupted increase in stocks and a marked downward trend in prices.

This development has led in recent years to the formulation and application of a so-called conservation program, which has taken the form of control of output and allocation of production among the various producing areas and among producing properties within particular areas. The program, although voluntary at the outset, has gradually been buttressed by the authority of the major oil producing states. In the summer of 1931 the newly discovered fields in Oklahoma and east Texas, the latter the largest in the world, with a flush production of about a million barrels a day and a potential production estimated in the tens of millions, threatened the breakdown of the proration program; but with the assistance of the state militia this was averted for a time and a temporary nation wide balance between oil production and consumption was secured. In May, 1932, the proration program of the industry was temporarily strengthened by a decision of the Supreme Court of the United States (*Champlin Refining Company v. Corporation Commission of Oklahoma*, 286 U. S. 210), in which the court held that the

program as applied in Oklahoma was legal. In limiting national and local output, however, no adequate restriction was placed upon the drilling of wells and the daily potential experienced a tremendous increase largely as a result of developments in the east Texas field, where the number of wells increased from 1625 in the summer of 1931 to approximately 10,000 by the spring of 1933. The enforcement of proration was made more difficult when the Supreme Court declared the use of state militia in east Texas unconstitutional and the Federal Court for the Eastern District of Texas held the proration orders of the Texas Railroad Commission a violation of constitutional guaranties.

Control of the American oil industry entered upon a new era as the power of the federal government under authority granted it in the National Industrial Recovery Act was thrown behind the proration program. The president of the United States, by executive orders, placed a ban on oil produced in excess of that allowed by the state regulatory bodies by prohibiting its shipment in interstate commerce, and signed a Code of Fair Competition for the Petroleum Industry. The code provides for limitation of imports of crude oil and oil products, for restrictions on the withdrawal of crude petroleum from storage, for periodic estimates of the domestic output required to "balance consumer demand," for allocation of the estimated required production among the several states, for allocation of the allowable requirement among oil pools, leases and wells within the state and (if necessary for enforcement) for the regulation of shipments of petroleum and petroleum products out of individual states, for supervision of the distribution of allotted production among refineries, for investigation and recommendations regarding transportation rates and practices, and for the operation of newly discovered fields in accordance with a plan approved by the president. The code likewise contains far reaching provisions regarding control of prices, whereby the price of crude petroleum is tied to the wholesale refinery price of gasoline. Sale of products below cost is prohibited. The administrative machinery, which may be temporary, for the effectuation of the provisions of the code consists of a planning and coordination committee and some other federal agency to be designated by the president, representing both the industry and the government.

The code includes regulations, no less significant in character, concerning hours of labor

and minimum wages, in drilling, production, pipe line and refining operations, in wholesale marketing operations and in retail filling stations. Provision is made also for protection of the hourly wage differentials paid to skilled workers in the industry on July 1, 1929. The code recognizes the right of employees to bargain collectively with employers through representatives of their own choosing.

The hours of labor provided for under the code represent a marked improvement over those long prevalent. A survey of hours of labor in the production, pipe line transportation and refining branches of the industry conducted by the United States Bureau of Labor Statistics in 1920, covering 35,255 male workers in production operations, 19,643 male workers in pipe line operations, 42,537 male and 274 female workers in refinery operations, showed that a regular working week of 7 days prevailed for 74 percent of all employees in the production operations, for 34 percent of all employees in pipe line operations and for 23 percent of all employees in refinery operations. The regular work week for the remainder was 6 days. Average full time hours per week in production averaged from 55.2 to 78.6, depending on the occupation; in pipe line transportation from 53.5 to 62.5; in refining from 44 to 60.2. A similar study in 1929 covering production and pipe line operations in the states of California, Louisiana, Oklahoma and Texas indicated little change in the normal working week, save in California, where a basic 8-hour day had been adopted. The United States Census of Manufactures for 1929 reveals that practically the entire refining labor force normally worked more than 45 hours per week and that 46 percent of the entire force worked more than 54 hours. A study by the Bureau of Labor Statistics in 1931, covering 2960 employees in 736 filling stations, indicated an average full time work week of 60 hours. During the period of the depression, under the share-the-work program generally adopted, hours were considerably curtailed in the production and refining branches of the industry, particularly in California and throughout the entire country in the establishments of certain large companies. Employees worked an average of 42.6 hours weekly in oil production during June, 1933, and an average of 39.6 hours per week in oil refining, but these figures, which are based on representative establishments, include part time employees: the normal full time work week has remained long,

the 12-hour day being still retained in some operations.

In 1929, 162,000 workers were employed in oil production and 80,596 in refining. 'The Bureau of Labor Statistics' index of employment in oil production for June, 1933, pointed out that 42 percent of those attached to the industry in 1929 were no longer employed. A similar index for employment in the refining branch of the industry indicates that in June, 1933, approximately 22 percent of those employed in 1929 had been displaced. 'The basic 36-hour week for oil production and refining adopted under the code, although it will increase reemployment, cannot absorb the labor force attached to the industry in 1929. Nor is an expansion of production with a return of business prosperity likely within the near future to increase employment in the oil industry to any great extent. Oil refining is so completely mechanized that a gain in plant output up to maximum capacity involves but a slight increase in labor force. Likewise, with oil potential vastly in excess of present requirements, output of crude oil may be tremendously augmented by the simple process of opening a valve. A decrease in the hours of labor from an average of 60, as shown by the Bureau of Labor Statistics' study, to 48 hours, as provided in the code, should, however, cause a substantial rise in the ranks employed in filling stations, the number of which has been growing.

Wages for the more highly skilled laborers in the oil industry, as, for example, drillers, have been relatively high; in boom fields in times of prosperity wages of from \$16 to \$18 for a day of 12 hours have occasionally been paid. Under agreement between the Shell Oil Company and its employees in California drillers received \$10.79 per day of 8 hours in 1929, and in refinery operations first class stillmen received \$8.05; there was a decline in 1932-33, drillers being paid \$9.71 and stillmen \$7.25. Weekly wages suffered more than the figures indicate since the work week was shortened from 48 to 40 hours in the establishments of this company. Representative data for other sections of the country are not available, but there is no doubt that the daily wage of this class of labor in some sections underwent a more serious reduction.

Because of the skill involved, the migratory character of the occupations, an expanding oil output and the vigorous opposition of capital, trade unionism has never gained a secure foot-

hold in the oil industry except in California, where practically the entire industry was organized in the early post-war period. In this section of the country the International Association of Oil Field, Gas Well and Refinery Workers of America suffered serious demoralization during the depression years. The collective bargaining provisions of the National Recovery Act may stimulate union organization among the oil workers.

In most of the major foreign oil producing countries production has proceeded in a more orderly manner than in the United States; Mexico and Rumania are, however, conspicuous exceptions. In the former until 1917 surface owners enjoyed the right to exploit or to contract to exploit oil deposits under their land; holdings in the Golden Lane area, Mexico's most spectacular field, were relatively small and exploitation involved waste on a large scale. In Rumania too, although subsoil mineral resources were nationalized under the constitution of 1924, because of the recognition of previously acquired rights, the small size of surface holdings and the state's practise of disposing of concessions by auction holdings have been highly competitive and there has been much over-expansion and waste. In the Latin American countries in general ownership of the subsurface minerals rests with the state and oil production is carried on usually by large companies operating under concessions, so that the development of oil lands is relatively orderly. The same is true of the Dutch East Indies, Persia and Iraq. Nevertheless, because of the terms under which concessions are granted, because of competition among geographic or national areas and among commercial companies—in brief, because of uncoordinated control of the world's oil resources—development has proceeded apace with resulting overproduction and physical or economic waste. With this expansion in world output there has been a shift in the relative importance of the different geographic areas in world production (Table II). Mexico has fallen from second to seventh place among world producers. Venezuela, where oil was first produced in 1917, rose to second place by 1929. Colombia, Persia, Trinidad, Argentina and Peru, each producing little or no oil before the World War, have become important producers. The Dutch East Indies, Rumania and Russia, long important producers, have increased their output substantially.

While it is widely disseminated as regards

geographic location and national control, the world oil industry is highly concentrated as far as economic and financial control are concerned. Two major groups of companies are preeminent, the Royal Dutch-Shell and the Standard Oil. Chief among the latter are the Standard Oil Company of New Jersey and the recently consolidated Socony-Vacuum Oil Company. The Standard of New Jersey represents an economic empire of vast proportions, controlling producing properties in the United States, Canada, Mexico, Bolivia, Venezuela, Trinidad, Colombia, Peru, Argentina, Dutch East Indies and Rumania; operating 13,000 miles of pipe line in the United States alone; possessing the largest specialized trade fleet afloat; conducting refinery operations in the United States, Canada, Peru, Argentina, Colombia, Cuba, Dutch East Indies, Dutch West Indies, Mexico, Rumania and Italy; occupying an important position in the oil trade of Great Britain, France, Germany, Poland, Switzerland, Holland, Belgium, Norway, Denmark, Sweden, Finland, Central and South America. In 1931 it had assets of \$1,919,000,000 and 114,656 employees, with 43,453 of these in the United States. The American concern is challenged by the Royal Dutch-Shell, whose crude oil output is even greater than that of the Standard Oil Company and whose transportation, refining and marketing activities are equally widespread. The Royal Dutch-Shell was formed by the union in 1907 of the Royal Dutch Company, incorporated under the laws of the

Netherlands in 1890, and the Shell Transport and Trading Company, Ltd., incorporated under the laws of Great Britain in 1897. The two companies, with assets in 1931 of 1,202,000,000 florins and £46,674,000 respectively, are both international holding companies, controlling jointly all the stock in the Anglo-Saxon Petroleum Company, Ltd., the Asiatic Petroleum Company and the Batavian Petroleum Company and having more than a hundred affiliated or subsidiary concerns. For many years the Royal Dutch-Shell has exercised almost a monopoly control of production in the Dutch East Indies, where the Royal Dutch first acquired importance as a producer of crude oil. In recent years through its American subsidiary, the Shell Union Oil Corporation, whose assets in 1931 amounted to \$439,000,000, it has invaded territory long considered the private preserve of Standard Oil and today it ranks as one of the most important oil companies in the United States. The rivals have engaged at times in bitter and prolonged competition. As the world output of petroleum has increased and the price trend for oil products has continued downward, the futility of price wars between these two giants has come to be recognized and in the last few years they have joined forces in an effort to stabilize producing and marketing activities. As a proration program and marketing practises aiming at the stabilization of prices in the United States have been carried forward, Standard Oil and Royal Dutch-Shell have led a campaign for

the achievement of similar ends on the world front. At an international oil producers' conference in Paris in the summer of 1932, designed to stabilize a situation alleged to have been rendered insecure by Soviet and Rumanian oil, the general principle of "stabilization . . . by reciprocal engagements to respect relative positions as regards exportations" was agreed upon and the parties arrived at a somewhat flexible quota plan to adapt world production to changing conditions of demand. The agreement was made incomplete by Soviet Russia's refusal to accept the terms submitted to it at an earlier conference, a refusal apparently occasioned by an unwillingness to abandon the distribution machinery it had set up in the world's markets in exchange for purchase by the Anglo-American companies of a specified amount of Russian oil annually.

How serious this default may prove is not yet clear. The Soviet oil industry has staged a remarkable recovery and expansion since the revolution, and under a nationalized control it has once more become an important factor in the world petroleum trade. From a peak of 85,168,000 barrels in 1901, at which time Russian output exceeded that of any other country in the world, Russian production declined to 25,430,000 barrels in 1920. From this low point annual output showed an uninterrupted increase, the rate of which was accelerated until 1931, when the Soviet Union took second place among world producers with an all time peak output of 162,842,000 barrels. This expansion of output has been accompanied by modernization of drilling practises, extension and improvement of transportation facilities and construction of additional refining units, an increasing proportion of which have been of the more efficient cracking type. Crude oil run to domestic stills rose from 39,900,000 barrels in 1913 to 139,300,000 in 1930, and domestic consumption of petroleum products from 5,923,000 tons in 1913 to 12,546,000 tons in 1931. Exports of refined products in 1931 reached approximately 39,000,000 barrels, distributed mainly in European countries and the Orient. The attempt to stabilize world oil prices without Soviet cooperation may be explained by the belief that growing domestic demand in the Soviet Union will absorb the prospective substantial increase in output and prevent larger exports.

As world output of petroleum increases and refining capacity expands the battle for world markets grows more intense. In this struggle

American oil has fought a losing battle. While the exports of gasoline by the major producing countries rose from 40,412,000 barrels in 1924 to 129,374,000 barrels in 1930, the American percentage fell from 72 to 48.8 percent, although the absolute volume of the latter increased during this period from 28,035,000 barrels in 1924 to 63,195,000 barrels in 1930. The decline in the world exports from 129,374,000 barrels in 1930 to 113,585,000 in 1931 was accompanied by a greater American decline, from 63,195,000 to 43,787,000 barrels. In the same period the exports of the Soviet Union and Rumania showed a substantial increase; those of the Dutch West Indies remained practically unchanged; those of Persia and the Dutch East Indies showed a relatively slight drop.

The World War having proved the military indispensability of petroleum and its products, oil became a special object of political concern to the major world powers in the following decade. This concern was augmented by the fact that all the major industrial countries of Europe, producing within their boundaries only insignificant amounts of oil, were dependent upon foreign sources of supply. The contest for control over producing and potential producing areas, dramatically characterized as the oil war, has involved not only the major commercial oil companies but the national governments to which they acknowledge allegiance.

In the years of turmoil in Mexico following the revolution of 1910, the conflicting interests of American and British nationals in a struggle for control of the Mexican oil fields are alleged to have afforded the occasion and the means of revolution and counter-revolution. American interest in Mexican oil influenced if it did not determine American policy toward Mexico in the decade following the adoption of the constitution of 1917. Diplomatic pressure directed toward the protection of American rights acquired prior to the nationalization by Mexico of its oil deposits under article 27 of the 1917 constitution was not lifted until the non-retroactive character of the provisions of the constitution was established by the Supreme Court of Mexico and the preconstitutional oil rights were recognized in the amendment to the petroleum law promulgated in January, 1928. Oil lands in the economically backward countries of South America and the Near East have been similar objects of diplomatic concern.

A decision by the League of Nations favorable to Great Britain in a dispute between Great

Britain and Turkey regarding control over Mosul and involving the principle of self-determination weakened American claims under the Chester concession to oil rights in Mosul and paved the way for an agreement between the Turkish Petroleum Company (since 1929 the Iraq Petroleum Company, Ltd.) and American interests. Under an agreement reached after prolonged negotiations, in which the American State Department participated, American companies were granted slightly less than a one-fourth interest in the Turkish Petroleum Company, which is to exploit Mosul oil lands east of the Tigris River to the Persian border under a seventy-five year concession. (A contract ratified in May, 1932, grants the British Oil Development Company a concession covering about 40,000 square miles west of the Tigris for a similar period of time.) Under this arrangement the British government through its controlling interest in the Anglo-Persian Oil Company, which has exclusive concessions covering 500,000 square miles and a monopoly of oil production in Persia, becomes directly involved in the development of these oil lands. British influence in this venture is further strengthened through the Royal Dutch-Shell, which together with the Anglo-Persian exercises a controlling interest in the Iraq company. A very considerable proportion of the world's oil resources are today under British control. The community of interest between the British government and Royal Dutch-Shell has been extended to the marketing field in various sections of the world—in India, for example, through the Burmah Shell Oil Storage and Distributing Company of India, Ltd., the joint marketing subsidiary of the Asiatic Petroleum Company (Royal Dutch-Shell) and the Burmah Oil Company, Ltd., which owns a large block of shares of the government controlled Anglo-Persian Oil Company.

France, through the *Compagnie Française des Pétroles*, shares control over the Mosul fields with British, Dutch and American capital and directly controls petroleum producing areas in north Africa. French capital also enjoys a substantial position in Rumanian production. Aside from these areas and Russia the world's oil production is largely dominated by American, British and Dutch (through the Royal Dutch-Shell) interests. Germany, deprived of its interests in Turkish oil lands by the exigencies of the war, has achieved signal progress toward independence of foreign supplies because of the commercial development of substitutes, al-

though it remains a large importer of crude oil and its products. During the war a shortage of oil led to the invention by the German chemical industry of several processes for the manufacture of synthetic gasoline. The most important was the Bergius process for the liquefaction of coal by hydrogenation. Control of these patents was eventually secured by the German dye trust, the I. G. Farbenindustrie. Since the war an arrangement has been entered into between the German dye trust and the Standard Oil Company of New Jersey for the mutual utilization of patents for the refining of crude oil by the hydrogenation process, and the Hydro Patents Company was organized to control and license the use of the process in the United States. The Royal Dutch-Shell and the Imperial Chemical Industries, Ltd., are said to have acquired participation with the Standard Oil and the I. G. Farbenindustrie in the patents for utilization outside the United States. The hydrogenation process, which permits 100 percent recovery of gasoline from crude oil and is applicable to coal as well, promises indefinite postponement of the oil shortage which was believed imminent a decade ago.

Meanwhile as world output has expanded and new geographic areas have been opened up, estimates of world reserves of crude petroleum have been revised upward. Foremost among the potential oil producers of the world, as judged by its unmined reserves, stands the United States, with the Soviet Union second. Iraq, Persia, Venezuela, the Dutch East Indies, Rumania, Colombia, Mexico, Burma, Peru, Argentina, Trinidad, Poland and Bolivia also possess important oil reserves. Canada, France, Italy, Germany, Albania, Spain, Czechoslovakia, China, Japan, Brazil and northern Africa have some petroleum resources, but it is believed that they will prove inadequate to meet their domestic requirements. Most of the world's petroleum producing areas have been too inadequately explored to permit of anything more than a scientifically calculated guess regarding the size of unmined petroleum reserves. Improved techniques in oil finding and oil recovery have indicated that estimates of recoverable oil have in the past been too low rather than too high. World output has increased greatly during the past decade and actual and potential producing areas have been extended. Despite these developments, in view of the fact that the world's unmined oil reserves are of a fixed although unknown quantity, the peak of world output will

at some date have been attained and world production of petroleum will then experience a permanent decline. When that time arrives, science promises to lighten through the utilization of coal, oil shale or other substitutes the hardships with which a declining oil production seems to threaten an industrial civilization founded on machinery.

ŌKUBO, TOSHIIMICHI (1836-78), Japanese statesman. Ōkubo, who came of the Satsuma clan, played a leading role in the restoration movement of 1867-68 in Japan. Although he held only a minor office at the inauguration of the restoration government, he was one of the few men who actually determined governmental policy. When other Satsuma leaders wavered in their allegiance to the central government, Ōkubo with Prince Iwakura won their support by a compromise in 1871, and he and Kido secured a continuation of Tosa support for the government. The conciliation of these clans made possible the abolition of feudalism. Ōkubo was a member of the Iwakura mission (1871-73) sent abroad to discuss treaty revision. He returned convinced of the relative weakness of Japan and of the necessity of preserving peace, while extensive reforms were initiated as a preliminary to changes in the treaties. Following the establishment of the Department of Home Affairs in 1873, Ōkubo was placed at its head, a position which he held until his assassination in 1878. When the samurai agitated for war over

the Formosan and Korean questions, he, like Iwakura and Kido, used his great influence to further peace. In 1874 he negotiated the agreement with China which settled the Formosan question in a manner favorable to Japan. The decision against war had temporarily disrupted the governing coalition, but it was reconstituted on the basis of the Osaka compromise, in which Ōkubo played an influential part. By this compromise the conservatives with whom Ōkubo was allied, and who were opposed to the rapid introduction of constitutional government, consented to the establishment of a senate. The present highly centralized system of local government was instituted under Ōkubo and represents his greatest constructive achievement. As home minister he planned also the measures necessary for the suppression of the Satsuma rebellion of 1877.

ŌKUMA, MARQUIS SIHGENOBU (1838-1922), Japanese statesman. In his youth Ōkuma studied western languages and politics; and when his clan, Hizen, came into the imperialist combination with the restoration, he became one of its principal representatives in government circles. After service in subordinate capacities he was appointed a councilor of state in 1870 and in 1872 minister of finance, a position which he held continuously until 1881. While in this post he arranged the financial settlement attendant on the abolition of feudalism, which Inouye had initiated, and revised the tax system. He withdrew from office in 1881, denouncing the proposal to turn over government undertakings in Hokkaido to private interests. Thereafter he was important principally as an organizer and leader of the progressive party, normally in opposition to the governing Satsuma-Choshu coalition. In 1888, however, he became minister of foreign affairs and attempted unsuccessfully to revise Japan's treaties with foreign powers. After another period in opposition Ōkuma again became minister of foreign affairs in 1896. In 1898 he headed the first government based upon the support of the new political parties, its formation resulting from an unstable union of Ōkuma's progressive with Itagaki's liberal party. With the immediate collapse of this premature experiment in party government, Ōkuma although retaining party leadership retired from political activity

until 1914, when he once more returned to office as head of a party government. During his tenure Japan entered the World War and served on China the Twenty-one Demands. Ōkuma was compelled to retire in 1916, his opponents holding that his foreign policy was not strong enough. Nevertheless, as one of the "elder statesmen" he was influential until his death in 1922.

As a party politician Ōkuma drew his support mainly from the new industrial capitalists, who in foreign policy favored the methods of economic rather than territorial imperialism. Ōkuma exerted a wide influence upon modern Japan especially in finance, foreign affairs and party development. In addition he left his impress upon Japanese intellectual and educational life through his writings and through the establishment of Waseda University.

OLD AGE can be defined only rather loosely as the latter part of the cycle of an individual life, a period during which some but seldom all of a long list of possible symptoms of physical deterioration are manifested. A hale and hearty old age is not unusual, while, on the other hand, many of the ailments of old age may appear at an earlier age than is customary. Stanley Hall's gruesome picture of old age—bent figure, increased adiposity, failing eyesight and hearing, gaps in dentition, wrinkled skin—would now be considered as a description of extreme senility, a stage of life reached only by a very small proportion of the human race. A more fundamental as well as a more frequently observed change is the gradual failing of physical and mental capacity, the early manifestation of which may be found long before recognizable old age has set in. In general the loss of physical prowess sets in long before mental faculties begin to fail, and during the "normal" process of gradual physical aging over a considerable period mental powers may continue to develop. Unless old age in these initial stages is terminated by death, the more obvious symptoms of senility may develop, usually in combination with various pathologic conditions.

True aging, the result of a gradual wearing out of bodily organs and tissues, rarely becomes manifest before 70 years. Most of the disabilities of the sixth and seventh decades of life which are usually ascribed to old age are caused by

chronic disease of certain organs long before the rest of the body is anatomically and physiologically senescent.

The diseases which contribute to the invalidity of the aging are organic heart disease, cerebral hemorrhage and apoplexy, diseases of the arteries, Bright's disease, cancer and high blood pressure. Other common ailments are the non-tubercular diseases of the lungs—chronic bronchitis and asthma—diabetes, rheumatism and disorders of the brain and spinal cord. Evidently old age, both normal and pathological, timely and premature, involves to a very large extent the problem of medical care. The appreciation of this fact is comparatively recent and special research in the degenerative diseases which attack man in the latter part of his life has yet to develop. There still remain the physiological causes of degeneration, which medical science is inclined to seek in the disturbances of ductless glands and internal secretions.

[Old age presents not merely physical but psychological problems. The definite psychiatric manifestations of mental senility, such as various psychoses due to disease of nervous tissue, are not only infrequent but do not constitute the essential psychic problems. Psychologists do not agree as to how far the usual manifestations of psychic changes are the result of physiologic conditions, and as to what extent they may result from the awareness of approaching dissolution and of old age as the prelude to death. This awareness may be responsible for the tragic attitude which seeks escape in relations with the younger generations, sublimating the desire for immortality by solicitude for the young, expressing fear of personal insecurity in an attempt to retain control over the economic structure of the household, tribe or nation.

The attitude of the social group to the aged, although subject to many variations and often assuming bizarre forms, has been determined by the various attributes of old age, that of the very primitive stages largely by physical and economic weakness and that of the higher cultural stages by appreciation of comparative mental strength. So long as the old and the weak were a severe burden upon the community struggling for existence, they were often abandoned, buried alive or put to death. These customs, prevailing particularly under conditions of nomadic life, frequently have survived that stage. In some localities custom even permitted the killing and eating of the aged. The explanation accepted by some anthropologists that the ceremonial killing

of the aged is primarily a religious rite and an expression of veneration may represent a formalized group rationalization of a situation arising out of the economic environment. Similarly, it is difficult to pass on the validity of theories which regard the killing of the aged as a manifestation of the fear of the evil possibilities inherent in old age or as an expression of a suppressed father hatred. The frequency of very strict injunctions against patricide found in various codes of widely separated communities and civilizations is at least an indication that the practise was subject to regulation.]

[The opposite attitude, that of deference to parents and aged persons in general as repositories of wisdom and tradition, is found in agricultural civilizations. It may have developed because in such societies the struggle for existence is less intense and also because here the aged may continue to participate in productive work and even in control. Thus paternal authority, which becomes authority of the aged, is at its height in many disparate civilizations—in China, in ancient Greece, among the Hebrews, in South America and Mexico. Filial piety is one of the fundamental principles of Confucianism, although it antedates Confucius in China and is similar in Japan and Korea. Respect for old age is one of the dominant principles in Talmudic ethics, and reverence and consideration for one's elders occupy a large place in Jewish life. A high appraisal of the intellectual and spiritual power of the aged and their nearness to death sometimes lends a supernatural significance to their blessings and curses, so that veneration for the aged merges into certain aspects of ancestor worship.

The economy of the Middle Ages, which was largely the natural economy of agriculture, provided a very secure place for the aged parent. In the patriarchal family the authority of the old man extended to the entire economic unit. He naturally retained the function of guidance and planning, even after his share in direct work had been reduced or altogether relinquished. Serfdom and slavery were economic relationships which granted some security to the aged serf or slave; and under the various modifications of the feudal system, where there was a labor contract, such security extended over an entire life period and included the family as a unit.

Moreover agricultural labor, although it may be strenuous, is relieved by interruptions and permits of a greater variety of paces, and there

is no direct competition between the old and young as to efficiency. Until comparatively recent times the agricultural family unit contained more than two generations, and the elders frequently continued as carriers of the title to the property, which included as well the right of control and management.

Even in agriculture, however, this traditional patriarchal relationship is now rapidly breaking up, with the disappearance of the patriarchal agricultural family and the exodus of the young from rural communities. The process of industrialization and mechanization of agriculture is likely to lessen, although not to the same extent as in other industries, the value of the older agricultural worker. For these reasons the problem of the aged among the farm population is most acute in the United States.

In the cities the situation of the aged is naturally still more desperate. Even independently of direct conditions and employment, modern industrial civilization aggravates the economic problems of old age by urbanization. The tendency toward decentralization of industry as a result of newly devised methods for transmission of power is of too recent origin to have influenced the general situation. But limited housing space and high rentals tend to make the support of parents a burdensome and costly factor in the life of the average working man. The industrial revolution has transformed a rapidly increasing proportion of the population into wage earners, and the economic difficulties which confront the aged are inherent in the very nature of the wage system.

A certain minimum of productive capacity is a necessary prerequisite of a wage contract. More and more, as the machine displaces manual energy and the whole process of production of the plant becomes one organic unit, the required minimum of intensity and speed of effort is set for an entire establishment. The determination of that minimum moreover depends not so much upon the physical as upon the economic conditions of production and lies altogether in the hands of the employer, who is motivated by profit considerations bearing no relationship to the interests of the employee. In the competitive labor market the aged and weak are inevitably at a disadvantage and are displaced long before their productive capacity has disappeared or even before it has been materially affected. Just as physiologically old age and disability are subject to wide and individual family variations, so industrial superannuation becomes a somewhat

artificial milepost depending upon individual judgments of industrial management.

The elimination of the industrially superannuated worker is even more drastically effected through the establishment of age limits in employment, which are often set far lower than standards of efficiency require. While managements frequently deny the existence of such barriers, the increased application of maximum age rules in hiring labor cannot be doubted. An investigation by the Industrial Relations Counselors of a large number of concerns employing over three million workers disclosed that 40 percent of the establishments employing over 60 percent of the workers had definite age limits—seldom higher than 45, often 40 and for certain occupations as low as 35. It is generally believed that a person over 45 has but slight chances of obtaining employment in railroads or public utilities and only somewhat better opportunities in manufacturing establishments. The rate of unemployment as well as its severity rises rapidly with advancing age. Frequently the rules against persons even in middle age are enforced as a precaution against early superannuation, especially where retirement funds have been established. Of course the age limit at time of hiring must not be interpreted as it sometimes erroneously is, as meaning that employed workers are in danger of losing their jobs when reaching this age.

Because of the considerable lag in the process of decline of intellectual powers as compared with physical strength, the problem of old age disability and unemployment is to a large extent influenced by occupational classifications. In finance, business management and control, the professions, public service, arts and sciences, the aged retain their dominating positions. The old man may remain a banker, a corporation officer, physician, lawyer, senator or judge of the Supreme Court or president of the United States. Few men under 50 have been elected to the highest offices in the land. Positions of guidance and control are still very largely reserved for older men and even women. It may be said therefore that in modern industrial society old age has become a distinct class problem. The primitive attitude of disregard of the aged as physically and economically weak is applied to the wageworking masses, while veneration of their wisdom and power, characteristic of early agricultural civilizations, is limited to the upper social and economic strata.

The quantitative magnitude of the problem

of old age in modern society is conditioned first of all by the proportion of aged persons to the social group. Contrary to common belief, it is probable that the proportion of the aged among primitive societies was very much below that prevailing in modern times. Even now the life expectation fluctuates around 30 and 35 in many primitive communities. In modern times, because of advances in medicine there have been substantial reductions in the mortality of higher age groups. The average life span has begun to show a marked increase within the last century, reaching 55 to 60 in various civilized countries.

The proportion of aged persons to the population is conditioned primarily by two factors—changes in the mortality of the higher age groups and changes in the birth rate. In Great Britain the proportion of persons 65 years and over had increased from 5 percent in 1871 to over 6 percent in the latest census of 1921, while in Germany it had risen from 4.5 percent in 1871 to 5.5 percent in 1925. In countries of immigration, like the United States, the stream of arrivals in which certain younger age groups predominate may disturb what otherwise may be a normal age distribution. Mass emigration may exercise a similar influence in the opposite direction, as, for instance, in Ireland or in certain rural districts of the New England states, which show the largest proportion of aged persons within the United States.

In the United States the proportion of persons 65 years and over has constantly been increasing, and under the present economic system this involves an increasing liability to be carried by the productive portion of the population. The accompanying table based on figures of the census shows that in so far as this increased ratio results from a reduced birth rate and a reduced ratio of children, there is an apparent automatic balancing or even reduction of the number of dependents:

AGE GROUP	1880	1890	1920	1930
Under 15	38.1	34.4	31.8	30.0
Over 65	3.4	4.0	4.6	5.4
Total dependent age groups	41.5	38.4	36.4	35.4

The apparent saving due to a smaller proportion of children is, however, offset by the progressive prolongation of the age of support of the young and the decrease in employment opportunities for the aged, without any compensating public provision for them. Moreover this very persistent increase in the proportion of persons 65 and over is certain to continue in the

United States because of the discontinuance of immigration and also because of the constantly and rapidly falling birth rate. The limits of this rising proportion depend on many factors. No revolutionary discoveries in medicine and hygiene affecting treatment of the generative diseases which might influence it greatly are on the immediate horizon. Assuming therefore the continuance of the present mortality rates for the different age groups and a stationary population in which the number of births will balance the number of deaths, the number of aged persons is likely to approach 10 percent or even more. Professor P. K. Whelpton (American Statistical Association, *Journal*, vol. xxvii, 1932, supplement p. 92-101) estimates that by 1975, when a fairly stationary population will be reached in the United States, the proportion of aged persons 65 years and over will approach 13 percent; with a probable population of 165,000,000, the aged will exceed 20,000,000.

There are striking differences in the proportion of the aged among various groups. Thus the Negro population shows a very much smaller proportion of aged—less than one half of the white; this cannot be explained by the higher birth rate (since the latter is counteracted by a higher infant mortality rate) but is due to the higher mortality rate of the Negro in the higher age groups. The foreign born show a higher rate of aged persons, because of a very much smaller proportion of foreign born children; and again the native born of foreign parentage show a lower proportion of aged persons, since immigration was comparatively slight until 65 years ago. The tendency to explain these differences by essential racial influences has been largely abandoned, since differences in mortality rates have been found to be influenced by living standards and economic environment. There is no necessary difference in the proportion of aged as between rural and industrial areas.

In view of the radical differences in the nature of the problem of old age in different occupational groupings the question of influence of occupation upon longevity is one of considerable importance; such influences are not, however, easily traced from available statistical data. Dublin has estimated that at the age of 20 the life expectation of the upper professional classes is about 50 years, but for wageworkers (or rather carriers of industrial insurance contracts) it is only 42. Such generalizations are open to question, for it is only in the higher occupational groups that permanency of occupational status

may be assumed. For the general mass of wage and salary workers, particularly in unskilled labor, there is likely to be a gradual reduction of occupational status. Occupational statistics of mortality and longevity are bound to be very inaccurate, for the description of occupation at death is no guaranty as to occupational affiliation throughout a lifetime. Only by a study of industrial insurance of large occupational groups is it possible to show a higher mortality rate among wage earners than in the upper economic strata.

The question as to what proportion of the aged becomes economically dependent can be answered only if the terms aged and dependency are exactly defined. Because it is impossible to give an exact chronological limitation of old age (except for purposes of legislative enactment), its economic problems gradually merge into those of chronic illness (premature old age); but for statistical purposes all persons over 70 or over 65 are usually included. The term dependent may be limited to those who are actually devoid of all economic resources and are compelled to apply for public or private relief; it may include, however, all who must rely upon some source of support, even members of the family. In the latter sense a large proportion of the aged are or must become dependent.

In those countries where systems of public provision exist, accurate data are available as to the number of those who receive benefits, either by pensions or by insurance. It may perhaps be inaccurate to describe such persons as dependents because existing legislation provides them with a definite source of income. Their number, however, may serve as an indication of the proportion of would be dependents if these public systems did not exist. In 1921 it was estimated that there were approximately 3,237,000 persons 65 years and over in Great Britain; in 1930 the number who were receiving old age pensions was 1,961,103; in Germany for the same year 2,391,065 out of a total of 4,108,000 benefited similarly. Because of the total absence of such systems in the United States until very recently, many special studies have been made to determine whether old age provision through legislation is necessary and, if so, what proportion of the aged would require such provision, and the probable cost. The statistical information so acquired has not always been consistent or unbiased. The many studies by state commissions are often of limited significance, because of differences in outlook and inadequacy of scope. The most recent data are those gathered by the

National Civic Federation in 1927, which cover a limited list of selected cities in four eastern states (New York, Pennsylvania, New Jersey and Connecticut) and which include about 14,000 persons 65 years or over—less than one third of 1 percent of the total number in that age group. Nevertheless, the study throws light on the economic condition of the aged in the United States prior to introduction of old age pension systems: 29.5 percent of the total over 65 years of age (25 percent of the men and 34 percent of the women) owned no property at all, 40 percent of the men had no income from work or business, 17 percent had neither property nor income, over 25 percent of the men and 14 percent of the women were totally unable to work and 30 percent and 46 percent respectively were able to do light work only; 38 percent were aided by children or other relatives, only 1.3 percent were supported by public or private charity (exclusive of institutions for the aged not covered by the study) and nearly 60 percent were receiving no aid at all. Moreover many of the aged were afflicted by chronic illness or invalidity. The situation appeared to be aggravated when higher age groups were analyzed. Taking these data as fairly representative of the 6,500,000 persons over 65 years of age in the country in 1930, the estimate is justifiable that some 1,900,000 aged have no property and over 2,400,000 no earnings, while nearly 1,200,000 have neither, so that the problem of unrelieved destitution in old age was acute for at least one third of the entire group. In England before the establishment of the old age pension system destitution among the aged was even more widespread.

An appraisal of the economic aspects of the problem of old age requires a further classification of the various methods of economic adjustment. These are: preservation of earning capacity and employment; retirement on personal savings; retirement on pensions granted by the government authorities, by trade unions or by private employers; support by immediate family or more remote relatives; private charity; outdoor relief; private homes for the aged or hospitals for incurables; institutions for the mentally disordered; almshouses; a system of old age pensions; and a method discussed but not yet tried in the United States, compulsory old age insurance.

The data as to the distribution of the 6,500,000 aged in this country according to this classification are very fragmentary; nor is there information as to the number of old men or

women who are in dire need, receive no aid and face the difficult problem of mere physical existence. Certain tendencies are, however, discernible. Thus the chances of retaining occupation decline rapidly not only with dependent age but also with the development of modern industry, so that usually only the self-employed can retain their status. All statistics of unemployment always show a rising ratio of unemployment with increase in age. Retirement on accumulated wealth is obviously exceptional.

Retirement on earned pension is limited to a portion of those in public employment and a very small percentage of those in private industry. In 1927, according to an investigation made by the United States Bureau of Labor Statistics, there were 21 state and 7 municipal systems of retirement for teachers and 17 municipal systems for policemen and firemen. In 1926 the United States government after many years of agitation established an extensive system of retirement for the employees in the classified civil service. The federal system and most of the state schemes are based upon a system of contributions from the employees and the state treasuries in varying amounts and therefore really represent application of the principle of compulsory old age insurance with substantial sharing in the cost between the individual and the government, which is also the employer. In developing these systems the United States was largely influenced by European countries, where many years earlier practically all of the important governments established such provision for public employees (Great Britain as early as 1810, Germany in 1873 and the remaining European countries largely after the beginning of the twentieth century).

While these compulsory schemes are for the most part limited to public employees, similar but voluntary superannuation retirement schemes have been established by a number of private enterprises; in recent years, with the beginning of active agitation for government action, these have received considerable publicity and are advanced as a preferable substitute for state action. Such retirement systems are most frequently found among public service corporations. In 1926 Abraham Epstein listed some 370 pension schemes covering about 3,300,000 employees and carrying at the time between 90,000 and 100,000 pensioners. Most of these systems have been established since 1910; that is, during the period of exceptional growth in industry. According to Epstein's esti-

mate, some 16 percent of all employees in industry and transportation had at the time some prospective coverage in case of old age. A more recent estimate by the Industrial Relations Counselors places this even lower—at 14.4 percent.

It is doubtful whether, since the onset of the current depression in 1929, many such systems have been added or whether in fact all of them have survived. Most of them are not contractual obligations. The conditions are prescribed by the management, administration is entirely in its hands and it is usually carefully provided that the retirement schemes may be modified or abolished at any time at the management's discretion. A prolonged period of uninterrupted service with the same employer is usually required, and it has been estimated that less than 5 percent of the employees remain in service long enough to be eligible for retirement allowance. These pension plans have frequently been attacked by labor organizations because they may prove a powerful factor in suppressing strikes or any other organized effort on the part of labor for improvement of conditions of the labor contract, and also because of their immediate influence in reducing actual wages. Many of these systems are actuarially unsound in that they are not promoted by ample reserves and depend partly or wholly upon current contributions out of the earnings or profits of the corporation.

Trade union provisions for old age pensions are very limited in scope. They were introduced into the carpenters' and engineers' unions in the United States by trade unionists of British origin. In 1930 only 12 out of over 100 national and international labor organizations had some pension scheme, and in that year 11 of these paid out \$3,500,000 to some 13,000 pensioners; the total amount disbursed in pensions during the entire period of their operation did not exceed \$22,000,000. In its findings the New York Old Age Security Commission of 1930 indicated that these systems, based on members' contributions, were in the main on the verge of bankruptcy and could not be expected to continue. In 1932 only 10 were paying pensions. Six of the 12 unions also maintain homes for their aged members, allowing them a choice between receiving pensions or entering these homes.

Another form of public provision for old age, although it is not usually designated as such, is the system of war pensions. There are more persons receiving straight government pensions

through the United States pension office than from all other systems, private or public, existing in the United States today; but these amounts are considered a part of the cost of war and are seldom thought of in connection with the problem of old age dependency. While the number of pensioners of the Spanish-American War, the Civil War and earlier wars has been declining since 1893, when it reached its peak of 760,000, in 1930 the number was about 257,000, all of whom may now safely be classified as old age pensioners. From an economic point of view the criticism is obvious that these pensions requiring hundreds of millions of dollars annually are granted for considerations other than those of economic status and need. Many advocates of general old age pensions point out that these war pensions have cost much larger amounts than the entire British old age pension system and yet have evoked comparatively little criticism, either on the ground of extravagance or demoralization of recipients.

Until recently the poorhouse, the almshouse and the county farm remained the dominating method of public relief for the aged in the United States. Historically of course these were not special institutions for the aged but accommodated all paupers who became public charges. The gradual establishment of specialized institutions for groups other than the aged has, however, transformed the poorhouses into homes for the old. Whereas in 1880 persons over 65 constituted only 33 percent of the total number of inmates, by 1923 this group had reached 66 percent. Although there are some signal exceptions, little has been accomplished to fit these almshouses for the particular function of the care of the aged. The very unsatisfactory standards of most of these institutions, the rule for separation of married couples prevailing in many of them and especially the social stigma of pauperism attaching to commitment in an almshouse have made it only a final resort for the aged poor.

Since in the United States private charity still remains the predominating, and until comparatively recently almost the exclusive, method of dealing with individual distress, consideration of the problem of old age has been gradually forced upon the attention of voluntary philanthropic agencies. Private philanthropic enterprise has established old folks' homes, in which they may be taken care of in a more humane fashion than in almshouses. Often the provision for keeping married couples together has been their distinct contribution. Again, recognition

of the advisability of a religious atmosphere for persons of advanced age has led to the creation of sectarian old people's homes. Sometimes the grouping has been along national or professional rather than religious lines. For a century such homes have been a popular form of private philanthropy. Of the more than 1000 homes studied in 1929 by the United States Bureau of Labor Statistics, 170 were more than 50 years old. Within the last decade 143 new homes have been established. The various types of homes for the aged, few of which are located in agricultural states, may be grouped as follows: 63 federal and state homes; 526 religious homes; 112 fraternal homes; 36 nationality homes; 44 trade union and other homes; and 486 private benevolent homes—a total of 1267. Except for the federal and state homes, almost exclusively devoted to the care of old soldiers and sailors, and usually built on a very large scale for purposes of economy, nearly 65 percent provide for fewer than 50 inmates each. While the standard of care and comfort varies, with few exceptions they rank far above the county almshouse. Because in most cases there is a lump sum admission fee or maintenance charge, little or no social stigma attaches to the inmates or their families. Almost all the private homes are full to capacity and have long waiting lists. Their total capacity barely approaches 70,000, or not much above 1 percent of the total number of persons 65 years of age and over.

Because of this inadequacy of capacity perhaps and even more because of the stubborn resistance of a certain proportion of the aged to institutional placement, organized philanthropy in the United States has gradually been compelled to assume the burden of care of the destitute aged through outdoor or family relief. In recent years and up to the period of the economic depression the charity organizations were gradually being transformed into family welfare societies, whose main purpose is an adjustment of families through the therapeutic methods of case work. The aged, however, offer very little hope for final rehabilitation or readjustment and are likely to remain on the relief rolls for many years. The financial burden, especially in view of the limited funds available for this purpose, is therefore very heavy; but their own theory prevents family welfare agencies from insisting that aged dependents who resist institutionalization be forced into a home, even if vacancies are available. Financial assistance to the aged poor has therefore become a very pressing and

irksome problem for private philanthropic institutions.

The demand for a broad national policy of provision for old age has become an important plank in labor programs throughout the industrial world and an essential feature of the movement for social insurance which, beginning with Germany, has spread throughout the industrial world during the last forty years. It has been estimated that 41 countries have some system of care for the aged through public pensions and voluntary and compulsory insurance. These systems are not, however, complete in coverage—in Switzerland they apply only to some cantons and in the Latin American countries only to workers in public utilities. Outside of some feeble efforts to stimulate voluntary old age insurance for wageworkers on a strictly actuarial basis by the establishment of state insurance institutions and even by the offering of substantial state subsidies for this purpose, the movement for governmental provision for old age has proceeded in two distinct directions: straight government pensions and compulsory contributory insurance systems for wageworkers.

The oldest straight governmental old age pension system is that of Denmark, established in 1891; New Zealand followed in 1898; Great Britain, which offers the most important example of this form, in 1908; Australia in the same year; Newfoundland in 1911; Uruguay in 1919; Norway, where as yet it is enforced only by municipalities, in 1923; Finland in 1925; Greenland (for native citizens) in 1926; Canada in 1927; and South Africa in 1928. The system of general compulsory old age insurance, which had previously been applied to selected groups, e.g. miners and seamen, in Austria, Belgium and France, practically originated in Germany in 1889 as a culmination of its compulsory insurance system, which developed in the early 1880's; it has spread gradually over a much greater area, particularly since the conclusion of the World War, and now embraces 16 countries, covering practically all of continental Europe. The systems of Germany, Austria, France, Rumania, the Netherlands and Sweden were established before the war and of Soviet Russia, Greece, Belgium, Spain, Italy, Portugal, Yugoslavia, Bulgaria, Czechoslovakia and Great Britain after the war. In Austria and Yugoslavia these systems have not yet been enforced. Within the past decade a number of Latin American countries have adopted similar systems; Argentina adopted old age insurance in 1923 but it has not

yet been enforced, pensions being limited by previous legislation to bank employees, railway workers and those in public utilities; Brazil insures public employees, Cuba, railway and maritime workers, while Bolivia, Chile and Uruguay have more complete insurance provision. Perhaps the most significant advance in the movement for compulsory contributory insurance was its adoption by Great Britain in 1925, after 17 years of experimentation with straight pensions. The latter were continued for persons who had already become beneficiaries, and the pension age was reduced to 65 instead of 70. For those not yet eligible the contributory system was provided despite considerable opposition to the system of contributions on the part of the working masses.

In Europe for many years there has been intensive discussion of the comparative merits of the two principles. Straight pensions—at least in Europe—are paid directly out of the resources of the national government. The minimum age is usually high—70 or 65. Such pensions are usually awarded upon evidence of need and thus partake of the character of a public relief measure, although a distinction is carefully drawn in law between pensions and ordinary outdoor poor relief. They are uniform for all beneficiaries, except as to possible differences in the rates for men and women. In contrast, compulsory insurance systems, except in the Soviet Union, require payment from the insured as well as from employers, and in most countries there is some contribution from the state government as well. These contributions usually are fixed according to the level of wages and the pensions earned are adjusted to the size of contributions, or indirectly to the wage level, as well as to the number of contributions or to the duration of insurance. No evidence of need is required. The coordination of the pensions thus earned with wage rates and therefore with variable standards of living makes possible a greater variety of pension levels and more substantial awards, at least for a proportion of beneficiaries. The accumulated individual reserves for each insured person make it possible for the benefit to mature earlier in case of invalidity or premature old age.

The arguments advanced in favor of the straight pension system are that it is simple, devoid of all the complications of an insurance system. It is held moreover that earnings are usually too low to allow any deduction for old age insurance, and that the superannuated wage-worker at the advanced age at which pensions

are granted is entitled at least to maintenance and support. The contributory insurance system is defended on the grounds that it is free from the degrading element of charity, does not discourage individual thrift, permits of a better adjustment to varying economic and social levels within the wageworking groups and places part of the cost upon industry, thus reducing the burden on state treasuries. There is, however, the obvious consideration that such a system requires a long period of time for successful application, since it is based to a very large extent upon accumulation of contributions and interest. Moreover it is powerless to meet the immediate problem of old age need; in fact when contributory systems are introduced, it becomes necessary to provide for various complicated, temporary or transitional provisions to take care of those already of eligible age. To a large extent these transitional provisions amount to straight government pensions which are gradually transformed into annuities purchased by accumulated contributions. The system established in Great Britain indicates a method of transition from straight pensions to compulsory insurance.

The American movement for old age security is not over a quarter of a century old. It began at about the same time as the movement for workmen's compensation with the introduction of bills in the United States Congress (that of the Socialist congressman Berger in 1911 being among the first) and in the state legislatures and the appointment of state commissions for study of the problem. Such commission reports were published in about a dozen states, those of Massachusetts (in which no less than seven were made between 1907 and 1925), Pennsylvania, Wisconsin, California, New York and Ohio being among the more important. Many of these admitted the seriousness of the problem and usually by divided vote recommended adoption of straight old age pensions. Contributory compulsory insurance was sometimes approved but usually discarded for immediate action because of its complexity. Legislators strongly objected to enactment of old age pensions, mainly out of fear of taxpayers' resentment, clearly expressed in the organized opposition of chambers of commerce, boards of trade and similar organizations. This opposition was usually disguised by a variety of arguments as to the absence of urgency in comparison with European conditions, the preferability of traditional American methods of private philanthropy and the demoralizing effect upon the recipients or their fam-

ilies. The force of these arguments appears to have been overcome gradually by agitation and propaganda. An Arizona act of 1914, very carelessly drafted and promptly declared unconstitutional, provided not only for pensions but also for abolition of all almshouses within the state. A very specific and limited act was passed in Alaska in 1915, but active legislative effort may be said to have been delayed until 1923. Within the five-year period 1923 to 1927, nine states enacted old age pension legislation. These advances, however, were more apparent than real. In California and Wisconsin the acts were vetoed by the governor, the Pennsylvania act was declared unconstitutional after a very bitter struggle and the other six acts, which still remain on the statute books—namely, those of Montana, Nevada, Wisconsin, Kentucky, Colorado, Maryland—are all of the optional type, being little more than enabling acts permitting the counties to establish old age pensions if they deem this desirable; with the exception of the Wisconsin law they have largely remained dead letters. Legislation of this type received support from the fraternal Order of Eagles and occasionally was accepted by legislators in midwestern states, because of the political strength of the order and because it committed the state to little or nothing. Real legislative progress dates from 1928 and has been the result to a large degree of the very energetic propaganda of the American Association for Old Age Security organized in 1927. Within the brief period 1929 to 1932 eleven states passed old age pension acts, of which the most important are those of California (1929), New York and Massachusetts (1930). Other compulsory acts are those of New Jersey, Delaware, Idaho and West Virginia (all of 1931). Colorado and Wisconsin have amended the earlier optional acts of 1927 and made them mandatory. By August, 1933, 25 states, Alaska and Hawaii had some form of old age pension security laws, although not of equal efficacy. The legislation of 18 states is mandatory, of 6 optional and, by recent amendment in 1 state, Minnesota, the present optional law will become mandatory. In 1932 there was introduced into the Senate the Dill-Connery bill providing for a national old age security system in which the federal government was to contribute one third and the states two thirds of the cost. The bill failed of passage, because in addition to the usual opposition arguments were advanced as to its infringement on the power of the separate states. It was, however, reintroduced in 1933.

In a very general way these American enactments, particularly the compulsory ones, follow the early British legislation. They provide pensions of varying amounts but generally approximating a dollar a day. The exact amount is frequently adjusted to other available resources and sometimes to other individual needs. Thus since the onset of the current economic depression the average monthly allowance in the various states was reduced from \$17.37 in 1928 to \$14.32 in 1930. In 1930 the lowest allowance was that of Kentucky, \$5.39, and the highest that of New York, \$27.48; the latter average was further reduced in 1932 to \$24.15. The inadequacy of these amounts thus counteracts to a certain extent the claims made for the economy of the pension system as compared with cost of maintenance in a poorhouse, the former being usually half and often considerably less than half of the latter. The pension age in the states with effective legislation is usually 70, and there is active agitation for the lowering of the age limit. The qualifications usually include requirements of citizenship and fairly long state residence as a safeguard against colonization of aged persons. The cost is usually shared by the county and the state. The number of persons receiving pensions in New York state in 1932 was 54,185; in California 12,520; in Massachusetts 17,146; and throughout the country the total for that year was approximately 100,000. In 1929 the estimated total was only about 2000, and in 1928 only 1000. The cost to New York state and its counties in 1932 was \$13,790,000.

While the number receiving pensions is substantial, particularly for the state of New York, the proportion to the total number of persons in the corresponding age groups is very much smaller than in Great Britain. The total number of persons over 70 years in New York City is approximately 300,000, and the persons qualifying for pensions constitute less than 15 percent of this number as compared with some 80 percent or 90 percent for a similar age group in Great Britain. The proportion of pensioners to the entire population in the state of New York is less than .4 percent as compared with approximately 4 percent in Great Britain. This smaller proportion of pensions can be explained in part by differences in economic conditions of workers in the two countries and in part by the fact that in the United States most pension acts require evidence that there are no persons responsible for and able to support the applicant, thus giving them, even more than corre-

sponding European acts, the character of poor relief measures.

It has frequently been admitted by commissions that a comprehensive system of compulsory contributory insurance would offer a more effective solution of the entire problem. On the other hand, such a system could not be put into effect within a short time and it involves a principle with which American wageworkers are unfamiliar. The universal approbation commanded by the system of old age pensions and the progress in this field since 1929 may nevertheless be considered as an important chapter in the somewhat belated development of comprehensive social insurance in the United States.

OLDENBARNEVELDT, JOHAN VAN (1547-1619), Dutch statesman and jurist. Oldenbarneveldt, representative of the wealthy burgher aristocracy, was a moderate Calvinist who, with William the Silent, successfully opposed the tyranny of Philip II of Spain. In 1579 he helped form the Union of Utrecht, which united the seven northern Calvinistic provinces of the Netherlands into the Dutch Republic. As pensionary of the province of Holland, which contributed 59 percent of the federal revenues, he was the most influential leader in the province and consequently in the republic, whose foreign affairs he guided for nearly forty years following

the union. Upon the assassination of William the Silent in 1584 he used his influence to secure for William's son Maurice the post of military commander of the Dutch forces in the continuing eighty years' war against Spain. At first he and Maurice worked in harmony; but after the twelve years' truce of 1609, which he had negotiated despite the opposition of Maurice, a bitter rift developed between them. Oldenbarneveldt favored decentralization of power with broad authority in the province of Holland; Maurice, having a majority in the States General of the republic, wanted more federal authority. Oldenbarneveldt, representing the wealthy burgher class, advocated peace with Spain for the sake of Dutch commerce; Maurice, as commander in chief of the army, desired to continue war for the sake of military glory and political power. Oldenbarneveldt was an Arminian, or moderate Calvinist; Maurice, caring and knowing little about religious questions, espoused the Gomarist, or strict Calvinist, faction as a means of fomenting opposition to his rival. As a result of these and other factional differences between the Republican and the Orange party, the venerable statesman was suddenly arrested at the instigation of Maurice, brought before a special court and, without counsel, books or papers for defense, was unjustly condemned to death on the trumped up charge of treason. His execution at The Hague was virtually a judicial murder, marking the triumph of military over civil interests.

OLIGARCHY, interpreted in its literal Greek sense as the rule of the few, is capable of wide application both to governments and to such extragovernmental groups as parties, churches and business corporations. The purely numerical implications of the term give it an essentially neutral tinge and have caused it to be preferred in certain quarters to other terms such as aristocracy, tyranny by a minority or party dictatorship, which although closely allied with oligarchy refer to qualitative differences in the nature of the rule. It is intrinsically so broad a term that it has often been viewed as the only real form of government: realistically understood, the concept aristocracy represents

merely a legitimization, in more rational and ethical terms, of minority domination; monarchy, on the other hand, cannot function without a small group of administrative agents; while democracy requires the emergence of a restricted coterie of leaders before it can effectively discharge the obligations of government. This argument, although it contains an element of truth, neglects the broad significance of technique in the making of basic decisions. It is not the existence of this limited group but the method of its establishment which serves as the essential criterion of the several forms of government. That oligarchy does not exclude a certain amount of consent on the part of the ruled goes without saying, since acquiescence of a sort is a prerequisite of all forms of government; but it is equally evident that under an oligarchy rational and conscious consent is not freely exercised by the large majority of the members of the group.

It seems highly questionable whether it is desirable to attach to the purely numerical, generic conception of oligarchy a more specific qualitative definition, as did Aristotle when he contrasted the principle of oligarchy, wealth, with the principle of aristocracy, virtue. In the first place it seems rather futile to undertake to bring order into the welter of conflicting terms which the transmission and transformation of Greek terms have foisted upon modern popular parlance. Schematic classification would prefer to characterize oligarchy, the rule of the few, by qualifying adjectives of a distinct descriptive content; in other words, to speak of military, priestly, economic and other oligarchies and to analyze a historic oligarchy with reference to these qualitative aspects. What completely escaped Aristotle is that the social organization of Greek city-states was such that they all were oligarchies in an economic and political sense, since minorities of varying sizes ruled in each of them, even in Periclean Athens. What appeared to Aristotle as the struggle between avowed oligarchies and other forms of government was in fact, from a comparative point of view, nothing but a struggle between oligarchies of ever more restricted membership. In this sense and from this point of view it might be said that the derogatory connotation which Plato and Aristotle attached to oligarchy was directed against this tendency of oligarchies to contract, and therefore against government by the fewer

rather than against government by the few. This tendency toward contraction seems to be inescapable, however, under certain conditions, notably the threats to vested economic interests which usually attend radical democracies, particularly when they are aggravated by a narrowing field of foreign exploitation. This generalization is borne out not only by Periclean and post-Periclean Athens but by many of the Italian and German city-states as well as by contemporary developments.

A cursory survey of history would indicate that the appearance of the oligarchic type of rule may be attributed to one of two primary sets of circumstances, the influence of which can be traced again and again at different periods: first, when there is armed conquest of populous districts by a racially distinct group, such as the Greeks of the early period, the Germanic tribes of the period of migrations, the Golden Horde and the Incas; secondly, when there is great accumulation of wealth in the hands of a comparatively small group of people which could not permanently maintain its power without military and governmental support. This conjunction of oligarchy with plutocracy, although primarily found in closely knit communities like the Greek, Italian and German city-states, may appear in such a polity as eighteenth century England; and while it is still too early to sift the necessary evidence, indications of the same tendency may be detected in Fascist Italy and National Socialist Germany.

Against the concentration of land and wealth and the attendant exploitation which from an economic point of view characterize the prevalence of such rule are arrayed the "masses," who may and usually will accept the leadership of an individual in their desire to throw off the yoke that is, almost without exception, inevitable under oligarchical rule. It is at this point that the drift toward monarchy can be discerned in successive ages, disguised at times as monarchy, at others as Caesarism, as dictatorship and the like. Since oligarchy in its origins has many affinities with plutocracy it necessarily implies a far greater identification of economic with political power than is the case either in a monarchy or in a democracy. For one man cannot own for any length of time the bulk of wealth within the community, nor can wealth remain evenly distributed among the masses of the people. Oligarchy may therefore, from a functional point of view, be characterized as the legal and political framework for an

unequal distribution of wealth and more particularly for the maintenance of such inequality when the total wealth of the community is declining.

The effect of oligarchy on the growth of culture is not uniform, but it has generally been asserted that inasmuch as the development of art is stimulated by the rivalry between individuals within such a limited group for acclaim by the rest, oligarchy must be considered the most favorable condition for that artistic endeavor. This generalization seems to be borne out by the Greek and Italian city-states, by the Roman Catholic church and by Dutch society at the time of Rembrandt, to mention only a few examples. But when the circle narrows and the oligarchs become fewer and fewer, a deterioration is likely to set in. The establishment of monocratic rule may for a limited time stimulate artistic development as a part of the effort of the monocrat to win the applause of the masses. But since effective competition is bound to cease, the selective stimulus disappears, and soon monumental size must substitute for qualitative perfection.

An effective oligarchy tends on the whole to disregard excluded classes or groups and to treat them as beings of an inferior order. The attempt of Aristotle to rationalize slavery in terms of an absolute superiority of the Greeks finds its counterpart in the older type of European colonial official who, while totally ignorant of the cultural values of the population over which he was set to rule, proceeded brutally to exterminate what he was not sensitive enough to recognize as valuable. This attitude is analogous to the contempt in which the common man or the rank and file is held within homogeneous groups by a ruling oligarchy. The indifference of the oligarch to the interests of the inferior members of the group over which he rules is an essential and important aspect of the general tendency of human groups to stratify, a tendency which arises out of the establishment of a restricted coterie of "leaders." The concentration of initiative is particularly noticeable in modern political parties, and it has given rise to the assertion that oligarchical forms are characteristic of all organized human groups. Thus early in the twentieth century certain writers, such as Ostrogorsky and Michels, called attention to the trend toward oligarchy in political parties. What especially interested Michels was the fact that an analysis of the parties advocating radical democracy

showed that they, particularly the German Social Democratic party, were strongly hierarchical in their structure. Obviously animated by his dislike for the petty bureaucracy of the German trade unions, Michels presents this fact in an unsympathetic manner. Similar analyses have been made of the modern press and of corporate business enterprises. But while these studies offer a valuable corrective to the uncritical early enthusiasm of democratic organization, they in no wise touch the central point at issue, which is leadership freely assented to by those led and not, as is now commonly assumed in certain quarters, the elimination of all leadership. Even though the "free" assent might be seriously hampered by deception and artificially engendered by effective propaganda, the situation is fundamentally altered once effective monopoly of such leadership has become established. This has been true in the trade unions, and there is a similar trend in various fields of industrial activity. One-party states are another case in point which is assuming ever greater significance. As soon as the opportunity for a choice between at least two alternatives is eliminated, oligarchy is in fact established; and it can be only a question of time until it begins to exhibit the typical tendency of an established oligarchy to contract. This situation in turn produces a popular reaction which may lead to monocratic rule in the form either of dictatorship or of monarchy.

OLIVEIRA MARTINS, JOAQUIM PEDRO DE (1845-94), Portuguese historian, economist and statesman. Although Oliveira Martins never received any university training and earned his living through business enterprise, he became one of the outstanding intellectual figures of modern Portugal. In his scientific works he attempted to assimilate and to apply the findings of contemporary anthropology, ethnology, prehistory, mythography, hierology and economics. He set forth his philosophy of universal history in *Taboos de chronologia e geographia historica* (Lisbon 1884) and in other works reviewed the development of Greece, Rome and the Iberian Peninsula, whose greatness he ascribed to their having set themselves up as strong and centralized powers. The first to express in a historical synthesis the concept of the unity of Iberian civilization, Oliveira Martins pointed out that Portugal lacked separate geographical and racial bases. This view, carried to extremes by others, reacted unfavorably upon the reigning dynasty. Although he conceded that chance played an important part in the march of events, he was an exponent of economic determinism; thus he was the first to emphasize the economic aspects of the Portuguese maritime enterprises. Later, however, in his studies of Nun' Alvares, João I and his sons, João II and Camões, Oliveira Martins eulogized the heroic spirit and the glories of Caesarism.

Certain of his writings, by virtue of their dramatic presentation and psychological penetration and because of their Hispanophile and Ibero-American sentiment, gained an enthusiastic audience among Portuguese, Spaniards and Brazilians; but his frequent reliance upon secondary sources and his rash interpretations and the fact that many of the concepts to which he subscribed have since been revised have tended to outmode much of his work. On the other hand, his discussions in favor of land reform, reorganization of public and private credit, removal of foreign financial domination, development of the merchant marine and of the colonies, are still of value. After a journalistic campaign for reform Oliveira Martins joined the Progressive party and in 1892 was appointed

minister of finance; he resigned soon thereafter because his efforts at reform were hampered by party intrigue.

OLMSTED, FREDERICK LAW (1822-1903), American critic of the antebellum South and landscape architect. Olmsted was the son of a Hartford, Connecticut, merchant. Because of bad eyesight and pronounced physical restlessness his schooling, which he received from clerical tutors and in Yale University, was desultory. After false starts in preparation for several professions he settled as a farmer on Staten Island, New York; but prompted by friendly differences with William Lloyd Garrison he went to the south, first in 1852, to view slavery at first hand. His *A Journey in the Seaboard Slave States* (New York 1856) was made up of reports to the *New York Times*. Later trips yielded *A Journey through Texas* (New York 1857) and *A Journey in the Back Country* (New York 1860); his previous works were drawn upon for *Journeys and Explorations in the Cotton Kingdom* (2 vols., London 1861; vol. i 2nd ed., New York 1862), which was designed to influence England to favor the North. In these books Olmsted showed the operation and social concomitants of slavery in meticulous detail and tried, although vainly, to make the slavery discussion realistic. He sought to prove the superior productiveness of free over slave labor and exhibited the economic and social exclusion and backwardness of the poor whites. He favored gradual emancipation, and to attain this end he proposed that for the purchase of their freedom the slaves be credited with all surplus production above maintenance and interest.

Shortly before the Civil War Olmsted became associated with the laying out of Central Park in New York City and later he was made its architect in chief. His successful treatment of this

municipal park brought him an expanding practise, in which he was retained by cities, states and the nation as well as by many owners of private estates. His public projects uniformly combined beauty and utility, his aim being the attainment of the "cultivated landscape as a means of urban recreation." He particularly sought to preserve the natural features of his landscapes and worked rocks, lawns and wooded dells into harmonious designs. In this characteristic his plans marked a complete departure from the schematized and artificial patterns of earlier European landscape architects. Among his other outstanding landscape projects are Prospect Park in Brooklyn, New York, the Back Bay parks in Boston, Riverside Park and Drive and Morningside Park in New York City, the Capitol grounds at Washington, D. C., the grounds of the Chicago World's Fair of 1893 and the reservation at Niagara Falls.

OLNEY, RICHARD (1835-1917), American lawyer and statesman. Olney was suddenly lifted by Grover Cleveland in 1893 from a lucrative corporation practise in Boston to the attorney generalship. First in that office and then in 1895-97 as secretary of state he proved the most vigorous, self-assertive and dogmatic member of Cleveland's second cabinet. A man of simple, strong and narrow character, his principal trait was belligerent individualism and his principal tenet an instinctive, unreasoned belief in laissez faire. He practised law without partners, avoided clubs, society and travel, had no close friends and showed the world a grim independence. But the shrewdness with which he assisted New England corporations and estates in the thirty years of rapid business expansion after the Civil War made him a trusted figure in the capitalist world in which he moved.

As attorney general Olney's chief responsibility was enforcement of the Sherman Anti-

Trust Act of 1890. Sharing the prejudice of most corporation attorneys, he avowed to friends that the law was "no good" and, anticipating its defeat in the Supreme Court before it was tested, made only feeble efforts to give it effect. He also permitted the case against the so-called sugar trust (*United States v. E. C. Knight Company*, 156 U. S. 1) to go to trial on weak grounds and with badly prepared arguments and, when it was lost in January, 1895, wrote that he was now justified in his avoidance of prosecutions. Olney showed still more distinctly his friendliness to corporations in the Chicago Pullman strike of 1894. His papers indicate that he favored abrupt use of federal troops to break the strike, but when Cleveland demurred Olney proceeded to effect the same end by more circumspect methods. He arranged for a drastic injunction from the federal courts against any act in furtherance of the strike, appointed as special assistant United States attorney a man designated by the railroad heads, hinted to the federal authorities in Chicago that he wanted an immediate call for troops and persuaded Cleveland to use them.

In foreign affairs Olney's name is associated chiefly with the marked extension he gave the Monroe Doctrine in his aggressive handling of the Venezuelan boundary dispute in 1895. The main lines of policy were blocked out by Cleveland, but Olney gave truculence and legal tartness to the papers of the administration on the subject. In the case of the Cuban rebellion, however, Olney sternly resisted all attempts to force American recognition of Cuban belligerency. Doubtless he was prompted in part by a desire to maintain peace with Spain; but there can be no question that his decision was to some extent influenced by Boston sugar investing interests, which feared that an independent Cuba would be chaotic. After 1895 Olney repeatedly advocated close association with Great Britain in the promotion of world peace and prosperity. He came to regard isolation as an outworn dogma and in an article published in 1898 declared that wealth and trade had made America a nation of world wide interests and that it must assume the international responsibilities of high place and power.

OMAR IBN AL-KHATTAB (c. 581–644), Arab statesman. Omar, one of the ablest of Mohammed's disciples, was sincere, energetic and severe. In the critical period following the prophet's death he played a decisive role in making abu Bekr caliph, and when abu Bekr died in 634 Omar succeeded to his office. The fact that he patterned himself upon the prophet was of supreme importance in his political success, for only thus could the sovereign rule of the first caliphs have become legitimized in the eyes of the people.

Under Omar Syria, Egypt and Persia were finally conquered. The task of administering this empire fell to him and he was largely responsible for its fundamental organization, becoming the founder of the "theocracy without a prophet." The new empire was in some respects entirely different from the state ruled by Mohammed: the latter had been a local, compact, Moslem-Arabic community, while under Omar the Moslem-Arabic ruling class stood out against the non-Arabic majority of subject people, who were important only as a source of income for the conqueror. The territory itself was considered almost entirely booty, but it remained undivided and was left to those in possession, upon payment of tribute. The land was regarded as the property of the theocracy and only the revenue was spent. For the financial administration the Byzantine and Sassanid tax bureaus together with their officials were retained, under Arabic governors. The conquered were allowed to administer their own internal affairs; their leaders, mostly bishops in the Christian domain, were responsible to the government. The Moslem-Arabic conquerors were forbidden to acquire any land; organized as an army they remained concentrated, preponderantly in cantons and military towns. Payments to those entitled to booty and pensions were made according to lists, which served also as citizen or army rolls. The whole administration was that of a military occupation, which sharply separated the position of the Arab and the non-Moslem, secured the financial situation against reckless demands for booty and in so doing created also certain legal rights for the subjugated.

ONCKEN, AUGUST (1844–1911), German economist. Oncken studied at Heidelberg, Berlin and Munich. From 1865 to 1871 he engaged in agricultural activity in the grand duchy of Oldenburg and in 1872 became lecturer at the agricultural college in Vienna; after a brief period of teaching at the technical school at Aix-la-Chapelle he was appointed professor of economics at the University of Berne, where he taught until his retirement in 1910.

Oncken's chief scientific interests were agricultural economics and history of economic doctrines. He formulated the idea which he arrived at through his experience in Oldenburg—that the solution of the agricultural labor problem lies in the industrialization of agriculture. When the agrarian problem became the subject of economic controversy in Germany, he wrote *Was sagt die Nationalökonomie als Wissenschaft über die Bedeutung höher und niedriger Getreidepreise* (Berlin 1901), in which he questioned the view supported by Brentano that the doctrine of diminishing returns was upheld unconditionally by Turgot. His preoccupation with agriculture led him to the study of physiocracy, the most complete agricultural system in economics. In *Der ältere Mirabeau und die ökonomische Gesellschaft in Bern* (Berne 1886) Oncken discussed the influence of the physiocrats in Switzerland; in *Die Maxime: Laissez faire et laissez passer* (Berne 1886) he traced the origin of this economic byword to Boisguillebert; in *Oeuvres économiques et philosophiques de François Quesnay* (Frankfort 1888) he offered a new and more complete edition of the non-medical works of Quesnay, who served also as the subject of a number of biographical studies which Oncken published in *Zeitschrift für Literatur und Geschichte*. The results of his studies were incorporated in his chief work, *Die Geschichte der Nationalökonomie. Erster Teil: Die Zeit vor Adam Smith* (Leipsic 1902, 3rd ed. 1922), in which he held that economics as a science really began with the school of Quesnay—a view entertained by Adam Smith and Karl Marx and adopted by Gide and Rist in their history of economic doctrines. Oncken undertook the defense of Adam Smith against the attacks of the German economists of the socio-ethical school; in *Adam Smith in der Kulturgeschichte* (Vienna 1874) and in *Adam Smith und Immanuel Kant*

(Leipsic 1877) he attempted to establish complete agreement between the ethical and social views of Adam Smith and those of Kant. His intention to extend the parallel to their economic ideas was never carried out.

STEPHEN BAUER

ONCKEN, WILHELM (1838-1905), German historian. Oncken taught at the University of Giessen and was for a short time a member of the National Liberal faction in the Reichstag. Influenced in his historical views by the Prussian historians Häusser and Droysen, Oncken was the most typical although not the most important of the political historians of Germany. More than any other he contributed to the prevalence of national liberal historical ideas among the cultured lay classes. Like Droysen, Oncken first occupied himself with classical studies; in the history of ancient Greece he sought an answer to the problems which were agitating the national and liberal circles of the Germany of his day. His chief concern was the problem of national unification under the hegemony of one state. His works on the modern period constitute a sort of world history of the era between the beginning of the eighteenth and the close of the nineteenth century. The dominant motif is the emergence of Prussia as a great power, the persistence of its strength during the revolutionary era and its leadership in the national unification under Bismarck. His works reflect the struggles of Bismarck against democracy, political Catholicism and the socialist movement.

Oncken's greatest influence was exerted through his organization of the *Allgemeine Geschichte in Einzeldarstellungen* (45 vols., Berlin 1879-93). This was one of the most successful attempts to produce a cooperative world history designed for wide circles of intelligent laymen, and it became the standard historical work for the cultured family. Scarcely any other work has so widely influenced the historical perspectives of the German people. It has served to make general historical knowledge a part of the national education and has helped to keep alive the view that history is the schoolmaster of the nation, the instrument of national training and

the means of arousing the sentiment of patriotism.

MICHAEL FREUND

Important works: *Isokrates und Athen. Beiträge zur Geschichte der Einheits- und Freiheitsbewegung in Hellas* (Heidelberg 1862); *Athen und Hellas. Forschungen zur nationalen und politischen Geschichte der alten Griechen*, 2 vols. (Leipsic 1865-66); *Die Staatslehre des Aristoteles in historisch-politischen Umrissen*, 2 vols. ONEIDA COMMUNITY. *See* COMMUNIST SETTLEMENTS.

OPEN DIPLOMACY. *See* DIPLOMACY.

OPEN DOOR. The essence of the open door doctrine is equality of opportunity among all nations for trade with any country to which the doctrine applies. By definition it is of universal application, since it governs in any country making no discrimination among other nations, but it is commonly associated with China because with reference to China it has become a specific issue of international politics.

The open door emerged as an international issue in 1899, but its germs lay in the most-favored-nation provisions of the earliest treaties between China and foreign powers—those following the Anglo-Chinese war of 1840-42. In these treaties it was provided that any privilege granted by China to any country extended automatically to any other country having a most-favored-nation clause in its treaty with China. In principle this was a guaranty of equality of rights. Only the abstract principle was involved until the preliminary moves for partition of China began with the heightening of imperialistic competition at the close of the nineteenth century. Alienations of territory on China's borders were followed by the exactions of leaseholds in China proper by Russia, Germany, France and England and then by the declaration of spheres of influence by those powers. All of these moves were made possible by the internal weakness of China. In 1898, the year of climax, China appeared to be doomed as a national entity.

Meanwhile the United States had contented itself with the role of a trading nation in the Far East. By reason of its own undeveloped continent it had no territorial ambitions. Its energies were still occupied with developing its own resources and exploiting the domestic market. But in the last decade of the century a foothold had been obtained in Samoa, Hawaii had been annexed, and in 1898 the Philippines were taken from Spain. The interest of the United States in far eastern politics and economic potentialities became more concrete. It was prompted to act by the successive alienations of territory from China in 1898, which threatened to block the United States out of the Chinese market altogether. The particular form which the American action took was conditioned both by the United States' traditional policy of isolation and by its late entrance into the imperialistic struggle. Unwilling to compete with the other powers in the dismemberment of China, particularly after the choicest spoils had already been seized, it wished nevertheless to preserve for itself equal commercial rights in the Far East. On September 6, 1899, John Hay sent notes to Great Britain, Germany and Russia asking them to declare formally that they would take no action in their respective spheres of influence interfering with any treaty port or vested interest in those spheres; that the Chinese tariff remain in force in ports in those spheres; and that no preferential harbor dues or railroad charges be granted in favor of their own nationals. Two months later similar notes were sent to France, Italy and Japan. All replied affirmatively, seizing the opportunity to lessen the competition which threatened to hurt them as much as it helped; Russia's answer was somewhat equivocal. Thus the doctrine became a formal statement of international policy.

While the United States became its official sponsor, there are evidences that it was first adumbrated in England. By the end of the nineteenth century England's interests had become primarily commercial and financial rather than territorial. Its future in China lay in developing that market for trade. Its fears were that later and more aggressive entrants into the imperialistic race would appropriate far eastern areas for their exclusive use. In March, 1898, John Hay, then ambassador to Great Britain, was asked by the British government to inquire of his government whether it would cooperate with Great Britain in opposing action by foreign powers tending to "restrict freedom of com-

merce of all nations in China either by imposing preferential conditions or by obtaining actual cession of Chinese coast territory." The American government responded non-committally. At the same time similar suggestions were being made by members of the British cabinet in debates in the House of Commons. Thus the first expressions in favor of the declaration of the open door for China were made in London rather than in Washington. The policy historically associated with Mr. Hay as secretary of state was one he had heard proposed when he was American ambassador in London. The open door policy was promulgated, not conceived, by the United States.

The role of sponsorship was subsequently assumed by the United States, however, and there was early occasion to recall to the powers their pledges. The interallied occupation of Peking after the Boxer Rebellion brought the Chinese situation to a crisis. On July 3, 1900, Secretary Hay sent a circular note to eleven powers explicitly stating American principles respecting China: preservation of "Chinese territorial and administrative entity" and "the principle of equal and impartial trade with all parts of the Chinese Empire." All eleven powers signified their adherence to these principles, the first of which is the logical corollary of the original open door doctrine and has ever since been considered a part of it. The first formal protest on behalf of the doctrine was made by the American government on February 1, 1902, prompted by Russia's patent designs for domination of Manchuria. Two days before England and Japan had concluded an alliance to combat Russian aggressiveness. Secretary Hay, in a note to the eleven powers, pointed out that the special privileges obtained by Russia constituted a monopoly in violation of the open door. Russia pressed its advance, however, until arrested by the Russo-Japanese War, which ended with Japan taking from Russia its possessions and privileges in south Manchuria.

Japan was immediately accused of discrimination against other nationals in Manchuria. These charges led to the Takahira-Root exchange of notes on November 30, 1908, in which Japan and the United States pledged themselves to support the integrity of China and equal opportunity for commerce in all parts of that empire. Meanwhile, however, Japan was consolidating a special position in south Manchuria.

The World War again brought the Far East situation to a crisis. As an ally of England, Japan

entered the war and took the German leasehold and railway in the Kiaochow peninsula. In 1915, taking advantage of the preoccupation of the western powers with their own affairs, it presented the 'Twenty-one Demands to China and forced China to accede to most of them, the most important being the extension of the Japanese leaseholds in the Liaotung Peninsula and the South Manchuria Railway to 1997 and 2002, respectively. Group v of the demands, which would virtually have converted China into a protectorate, were rejected. The American government immediately notified Japan and China that it reserved its rights under the guaranty of China's integrity and the open door policy, to which all the powers were committed. In November, 1917, the Lansing-Ishii notes were exchanged by the Japanese and American governments, Japan again pledging itself to maintain the open door and the United States recording its recognition that territorial propinquity gave Japan special interests in China, the last phrase being variously interpreted until the agreement was formally abrogated at the Washington Conference in 1921-22.

With the end of the World War the United States reentered on a course which it had abandoned in 1913. In 1909 the American government had sought to give a more positive interpretation to the open door by proposing the commercial neutralization of Manchuria through an international loan to China for the repurchase of the Russian and Japanese railroads in Manchuria, which would subsequently be under international supervision. This proposal and an alternative, reduced in scale, were rejected by Japan and Russia. Diplomatic struggle over railroad concessions continuing, an international banking consortium was formed out of beginnings made between 1905 and 1909, the United States being admitted only after severe pressure by President Taft. In 1912 Russia and Japan were also admitted and the six-power group announced that henceforth all foreign loans to China would be made through the consortium, the loans to carry with them the right of international supervision. Immediately after his inauguration President Wilson withdrew American support from the consortium on the ground that it threatened the administrative independence of China. With the close of the World War, however, taking cognizance of the threatened ascendancy of Japan, President Wilson changed his position and the American government now took the initiative in the for-

mation of a new consortium. Immediately disagreement arose over whether south Manchuria should be included in its provisions, Japan again asserting a special position in that area. The controversy never came to an issue, since China refused to make any agreement with the consortium, and it was absorbed in the broader discussions at the Washington Conference. At this conference the spheres of influence in China were formally renounced and in the Nine-Power Treaty all the powers having interests in China again and more explicitly than ever before bound themselves to respect the integrity of China and the open door. The latter was for the first time given specific and detailed definition.

The most severe test of the doctrine came with Japan's occupation of Manchuria in 1931 and the subsequent formation of Manchukuo as a nominally independent state under Japanese protection. On January 7, 1932, the American government announced in the Stimson note its refusal to recognize any situation in the Far East brought about in contravention of the Nine-Power Treaty and the Kellogg-Briand Pact, in other words, its refusal to recognize the alienation of Manchuria and the formation of Manchukuo. Japan has remained immovable, refusing to admit that its action has violated these agreements or closed the open door. The issue is thus joined and at the present time has not yet come to decision.

'The United States' espousal of the open door follows from a consistent recognition of its own interest in the Far East—a desire to keep the Far East open to commercial exploitation by all nations on terms of equality. That way lies the realization of its own future in the Pacific. Therefore no matter what party or what individuals have been at the head of the American government its actions with respect to the Far East have been in the same direction. Philander C. Knox or William Jennings Bryan, William H. Taft or Woodrow Wilson—all agreed on far eastern policy, although their interpretations of this policy did not always exactly coincide. Thus Taft followed a policy of active cooperation with the other powers interested in China, while Wilson, although he also adopted this policy after the World War, at the beginning of his administration attempted to follow a more passive hands off policy. Abstractly it may be said that whether or not the open door inures to the United States' interest, the alternative is a reversion to the battle of the concessions, the rivalries for the spheres and monopolistic

privileges of the 1890's and the exacerbation of international relations which culminate in war. If the principle of international discriminations is laid down in any area, the corollary is power politics.

OPIUM PROBLEM. The opium problem as it has been presented to successive international conferences beginning in 1909 includes not only the question of international cooperation toward the eradication of opium eating and smoking in the countries of the Far East (the older opium problem) but also international efforts

to limit the manufacture and sale of opium derivatives (morphine, heroin and codeine) to the legitimate medical needs of the world. The anti-opium conferences and treaties have generally dealt also with the control and limitation of other habit forming alkaloidal substances, such as coca leaf, the raw material of cocaine, and Indian hemp, the base of hashish. It is recognized, however, that most of the present political difficulties revolve around the older opium problem.

Opium, the coagulated juice of the opium poppy, has been used in medicine for thousands of years, although the isolation of its active alkaloids dates only from the nineteenth century. The medical use of opium, whether in the raw or in the refined state, tends to create a habit of addiction (see DRUG ADDICTION). It was in this manner that the introduction of opium into India and China by the mediaeval Arabs soon led to the use there of opium as a soporific. In China its non-medical use was forbidden, but in India it was made the subject of a government monopoly, which was farmed out by the Great Mogul. The introduction of tobacco smoking into China by the Portuguese during the seventeenth century gave a new impetus to opium addiction by fostering the smoking of opium, first as an accessory ingredient in the tobacco mixture and then as the principal euphoric element. In 1729 the Chinese emperor issued an edict forbidding the sale of opium or the maintenance of places where it might be smoked. Another edict, dated 1796, forbade the importation of opium. By that time opium was already being smoked without tobacco. The extension of the smoking habit in China during the nineteenth century and that of the opium eating habit in India are closely linked to European commercial and colonial interests, especially the British power in India. The British East India Company took over the opium monopoly in 1757, and in 1773 assumed control of the trade with China. Because of the conflict with Chinese policies on the prohibition of opium imports British traders induced the home government to wage two wars with China, as a result of which unrestricted opium trade was legalized (1858). In the latter half of the nineteenth century the cultivation of opium was sanctioned by law in China and developed rapidly. The domestic supply soon out-distanced the imported article, until at the opening of the twentieth century only about a seventh of the 22,500 tons consumed annually in the Chinese Empire was imported from India.

Addiction to drugs derived from opium became a problem in western Europe and America only during the nineteenth century, as a result of the use of morphine and heroin in the treatment of disease and in surgery. It attained serious proportions also in China during the second period of the prohibition of opium smoking, which began in 1906. There are stringent laws in all the occidental countries against the use of opium products except under medical prescription, and the chief problem is one of stopping illicit peddling and smuggling. On the other hand, in the oriental countries under the control of Great Britain, France, Portugal, Japan and Holland and in Siam there are government monopolies which sell prepared opium to orientals but prohibit sale to Europeans. In this respect Japan follows the custom of Europe, having pursued a stringent anti-opium policy in regard to its own nationals since the country was opened to European influence; in Manchukuo, which is under Japanese protection, it has established a smoking opium monopoly under the Ministry of Finance and has floated bond issues with opium revenue as backing. In China, although the cultivation, use and importation of opium are still officially forbidden, chaotic political conditions prevent the enforcement of such prohibition; Chinese war lords have encouraged or compelled poppy growing for revenue, the central government being unable to suppress the practise. In India slight progress has been made in combating the use of opium for eating, although the matter is now under discussion in the Indian provincial legislative assemblies.

From this survey it may be seen that behind the opium problem there is a fundamental divergence of attitude between East and West. The custom of eating and smoking has by this time become deeply ingrained in the social fabric of the eastern countries—so deeply ingrained in fact that it cannot readily be eradicated without the full cooperation of the western powers. But these powers, with their colonial interests, are heavily involved in the commercial exploitation of the eastern opium habits. While prohibiting prepared opium for their own nationals, they derive a revenue by permitting the natives to smoke or eat it. On the other hand, immediate and full prohibition, even if the powers could sacrifice considerations of revenue, would undoubtedly result in law evasion.

The chief countries which grow the opium poppy are, besides India and China, Persia,

Turkey, Greece and Yugoslavia. The latter three are the source of medicinal opium, since they produce poppies with the highest morphine content (sometimes as high as 15 percent). Formerly the main source of supply for the western powers with established opium monopolies, India has now limited its crop to domestic needs for eating and smoking and for medical and veterinary purposes—estimated in 1925 at 700 tons—and to monopoly orders from other governments. While continuing to sell opium for medical uses to Great Britain without restriction, India is now voluntarily reducing its other exports by 10 percent annually and in 1936 will no longer export opium even on foreign government certificate or to British colonies. The British government exercises only limited control over the native states of India, but it maintains that since these native states have no direct access either to the sea or to China except across British territory, it can stop any shipment of opium from these regions. Persian opium, the choicest for eating or smoking, has long been sold without restriction, although recent reports to Geneva show that the Persian government has attempted some export control. In 1925, as a result of the conference of that year, a League of Nations commission under Frederick A. Delano was sent to Persia and presented sound recommendations for crop substitution and gradual control of the traffic. These recommendations were not accepted by the Persian government, and "free" opium, shipped mainly from the port of Bushire on the Persian Gulf to unknown destinations, has rendered vain all attempts at limiting production. Powers which have monopolies formerly supplied by India are now turning to Persia, which also caters to the smuggler, the most serious competitor of the monopolies.

The chief countries which manufacture drugs from opium are the United States, Great Britain, France, Germany, Switzerland and Japan. In 1930 Turkey was added to the list, and in 1933 Bulgaria. The magnitude of the problem of control of the manufacture of drugs is indicated by the fact that in any one of these countries the total legitimate supply (estimated by the League of Nations on the basis of 1930 figures at 9 tons of morphine, 16½ tons of codeine and 2 tons of heroin) could readily be manufactured and leave plenty of surplus capacity to spare. In the last few years, however, there has been a sharp reduction in the amount of raw opium used for legal manufacture, whether for medical

and scientific purposes or for smoking opium as permitted by the Hague convention.

Agitation against the opium evil was first started by English reformers and missionaries almost immediately after England had negotiated the opium treaties with China, these groups finding a certain inconsistency in the attempt to force both Christianity and opium on the Chinese. In India the movement was hindered by the fact that the country was enjoying lower taxes as a result both of the foreign sales of opium and of revenue from domestic consumption. Also the Indian government has claimed that the Indian masses were too primitive in their understanding of medical needs to render it feasible for the authorities to encourage the education of the public as to the evils of opium addiction. A royal commission appointed by the British Parliament in 1893 whitewashed completely both the opium practises current in India and the opium policy of the Indian government.

It was not until the United States entered actively into far eastern affairs through the annexation of the Philippine Islands that any progress was made toward a solution of the opium problem. At that time it found a Spanish government opium monopoly in existence, and the suggestion was made that a transitory American monopoly should be set up, pending complete suppression. But the government decided upon immediate prohibitory legislation, in spite of the loss of \$500,000 in annual revenue. Through this attack upon the general principle of government opium monopolies the United States obtained the close cooperation of the Chinese government, maintained ever since. On the suggestion of Bishop Brent of the Philippines and of Dr. Hamilton Wright, who found that smuggling from nearby territory rendered the opium prohibition in the Philippines ineffective, President Theodore Roosevelt summoned the first international conference on the subject, which met in Shanghai in 1909. In order to put into effect the common understanding reached President Taft later convoked an international conference at The Hague. The resulting convention of 1912, finally effective in 1914 among a few states, is the Magna Carta of opium. By this time drug addiction had become an object of serious international concern and the treaty was therefore extended to cover derivatives. The signatories undertook to license drug manufacture, to restrict export to countries expressing a desire to import, and to provide domestic inspection and records. Manufacture

was to be regulated rather than limited, but the germ of the principle of import and export certificates, new in international trade, was included; that is, a manufacturing country was to send its drugs to another country only at the latter's express wish. The problem of "prepared opium," or opium for smoking, was handled less effectively; it was subjected merely to "gradual and effective suppression," the trade being prohibited "as soon as possible." This promise is still unfulfilled. The chapter recommending cooperation between China and the treaty powers has remained largely a dead letter. No efforts were made to abolish opium eating in India, this being regarded as a domestic concern.

The World War prevented most of the signatory powers from enacting the legislation which would make the trade restrictions effective. The United States in 1914 passed the Harrison Narcotic Act, which regulated domestic manufacture under a stringent system of inspection. The export of American drugs, formerly shipped to the Far East, many tons at a time, was taxed out of existence; American manufacturers accepted with good grace the loss of the foreign market, inasmuch as the act reserved the domestic market exclusively to them. The Jones-Miller Act of 1922 completed the fulfilment of American obligations under the Hague convention by setting up a Federal Narcotics Control Board to examine licenses, issue import permits for raw material and supervise the trade in narcotics in the public interest. Great Britain in 1920 enacted the very rigorous Dangerous Drugs Act. But these were the only countries which had honored their promises when the problem was taken over by the League of Nations.

Some progress had meantime been made with regard to smoking opium. India and China had agreed in 1909 that *pari passu* with the prohibition in China of the use of opium, the export from India should be reduced by 10 percent annually over a ten-year period. A committee of investigation, headed by an Englishman, certified to China's success in less than the agreed ten years. As a gesture of friendship India gave up its Chinese export at this point, thus foregoing a large revenue. Unfortunately the impetus gained was lost at this crucial point; the western powers were then at war and failed to take advantage of this opportunity to agree to suppress licensed opium smoking in their territories. China, considering its sacrifices vain, again took up poppy cultivation. Sporadic at-

tempts were made thereafter to stop cultivation and use; but in 1920, when the matter was put under League control, the situation in China was indefensible.

In other countries too the situation showed the inadequacy of the Hague convention. Although India exported exclusively to the Far East government monopolies, domestically it did not concede that legitimate use was confined to medicinal and scientific purposes: the Indian opium monopoly yielded £4,000,000 annually in addition to the lucrative license and excise taxes of the native states. In the Straits Settlements and Hongkong consumption under government monopoly increased steadily, the suggested control measures for the latter being considered impracticable. In North Borneo and Macao gambling and opium revenues were held essential to budgetary equilibrium. In the Dutch East Indies opium produced regularly about 8 percent of the revenue and in British Malaya nearly one third. Siam like China protested that illegal traffic flourished under a regime of extra-territorial rights. The import monopoly in the French colonies brought a satisfactory revenue to France but failed to reduce consumption or to stop smuggling. Cheap monopoly opium and an import certificate system eliminated illicit traffic in Formosa but did not reduce consumption. Smuggling continued rife on the Chinese frontiers of Korea and Kwantung.

This was the problem facing the League of Nations when it assumed responsibility under a clause in the peace treaties entrusting it with the execution of agreements concerning the traffic in opium and dangerous drugs. An advisory committee was set up in 1920, on which manufacturing countries and those concerned with smoking opium or the production of raw material were represented, to advise the Council on execution of the Hague treaty. At this time the United States held no official communication with Geneva, and information on the opium problem was exchanged only through unofficial private channels. The impossibility of separate action was made clear when a resolution by Stephen G. Porter, chairman of the House Foreign Affairs Committee, calling on the president to urge other countries to reduce the production of raw opium to that necessary for medical and scientific needs, was consigned to oblivion as a result of the non-cooperation policy. In 1922, however, an invitation came from the League Council to consult on reinforcing the Hague convention. Assistant Surgeon

General Rupert Blue was sent to sit with the League Opium Advisory Committee as an "observer." In 1923 Bishop Brent, Representative Porter and General Blue attended a meeting of the committee to ask the members to consider revision of the convention on the ground that the only legitimate use of opium was medical and scientific and that production should be reduced accordingly. The monopoly countries accepted with reservations; and the 1923 Assembly convoked not one but two conferences, one to consider smoking opium and the second, drug control and reduction of production.

Congressman Porter had previously agreed unofficially to such a division, yet the American delegation's official proposals at the 1924 conference included suppression of opium smoking as well as close regulation of drug manufacture and export. The other countries except China wished to confine the discussion of opium smoking to the first conference, to which the United States had been invited as an observer because of its relation to the Philippines. The United States delegation, however, together with that from China, refused and withdrew from the conference, without signing the excellent treaty on drug control. This Geneva treaty of 1925 was a great advance over the Hague convention; it covered a wider list of drugs and improved export control by a definite export and import certificate system. Most important was the creation of the Permanent Central Board, comprising eight experts not dependent on their governments, who were continuously to watch international trade, to receive periodic statistics and to warn of any concentration of material which might indicate illicit traffic. During this conference definite limitation of drug manufacture to the medical and scientific needs of the world was discussed, but the problems of quotas, price fixing and new competitors were not settled.

Although it was rejected by the American delegation, the convention of the first conference with regard to opium smoking was not entirely fruitless. It provided for review in 1929, noted the value of the registration and rationing system in suppressing opium smoking and as a sop to American opinion added a protocol accepting the principle of the suppression of opium smoking, contingent upon cessation of smuggling.

But the Geneva conventions failed to solve various pressing problems left by the Hague convention. Derivatives were not subject to con-

trol until the League Health Committee's report on their narcotic properties had been accepted; nations bound by the export and import certificate system continued to ship to those not bound; the illicit traffic moved from place to place as control tightened.

In 1929, on request of the Assembly, the Opium Advisory Committee drafted a plan for direct limitation of manufacture to medical and scientific needs, calling for a preliminary conference of manufacturing nations to distribute quotas among them. The conference was held in London in 1930 but failed to reach an agreement. Meanwhile a plan was advanced called variously the American plan, the Crane plan or the Blanco plan, based on a suggestion by an Austrian, Dr. Knaffl-Lenz. Each nation was to notify a central body of its requirements, and if not itself a manufacturer, it was to indicate the country from which it proposed to receive them. No sales and no other manufacture were allowed except to nations supplying such figures; but, unlike the quota plan, this scheme allowed manufacture by any nation which could obtain orders, thus tending to lower prices through competition.

In 1931 the Council convoked a conference on limitation of manufacture. A convention, resulting from a joint French and Japanese proposal, provided for separate estimates, binding on governments, for each drug and for each territory; the form, based solely on medical and scientific requirements, was to be prescribed by the Permanent Central Control Board. A new supervisory body was to make estimates for nations failing to supply them and to review those supplied. Manufacture might not exceed estimates of legitimate needs plus exports and minus imports and seizures, which must be accounted for. Large reserve stocks are permitted, however, and there is no absolute limit for manufacture and no control of Indian hemp. An internal control system provided publicity for all aspects of production and distribution. Most of the convention's proposals, it will be noted, had appeared in the proposals for the 1925 conference.

As the 1925 smoking opium convention had provided for review before 1929 of the position of the parties concerned, a League Commission of Enquiry was sent to the Far East. The committee in its report emphasized the need of stricter control but stated that among other drawbacks to suppression was the fear of colonial governments that an exodus of Chinese

laborers would ensue if opium were prohibited. A conference of far eastern nations at Bangkok produced a convention which was in no respect an advance on the Hague convention, and the problem remains unsolved, a challenge to both East and West.

Another unsolved problem is that of the limitation of raw opium production, and the League cannot evade this without obscuring the value of its work on drug control. So long as China and Persia fail to control production, no progress can be made. Until the twenty-year old farce of "gradual suppression of the use of prepared opium" is brought to a close, there can be no progress toward reducing production, since no one can know how far it should be reduced.

Public opinion, fostered by voluntary organizations, must force action by governments. The International Missionary Council has been effective in the Far East and in the home countries where Protestant missions have power. The Anti-Opium Information Bureau in Geneva, directed by a former member of the League Secretariat, A. E. Blanco, spurs the Opium Advisory Committee to forward action. Through a "Narcotic Education Week" the World Narcotic Education Association, directed by Captain Hobson, portrays to the youth the horrors of drug addiction.

The White Cross Anti-Narcotic Association of Seattle functioned effectively in helping to secure the passage of the Harrison and Jones-Miller acts. The Opium Research Committee of the Foreign Policy Association publishes factual analyses of treaties and the proceedings of the Opium Advisory Committee and prepares memoranda on policy for governments. The Bureau of Social Hygiene of New York City has initiated and financed scientific studies and publications on various points of the opium problem. The League of Nations Association in various countries, the General Federation of Women's Clubs of America, the Woman's Christian Temperance Union, the international Young Men's Christian Association and the Young Women's Christian Association and the Women's International League for Peace and Freedom all have opium committees.

OPPENHEIM, LASSA FRANCIS LAWRENCE (1858-1919), German-English jurist. Oppenheim studied in Germany and became professor of law at Freiburg and later at Basel. He had already won recognition as a criminologist when in 1895 he went to England, where he devoted himself to the study of public international law. He taught this subject first at the University of London and from 1908 at Cambridge University. He was one of the editors of the *Zeitschrift für Völkerrecht* and contributed to many legal periodicals.

His reputation as an international lawyer was world wide and rested especially upon his textbook, *International Law* (2 vols., London 1905-

06; 4th ed. by A. D. McNair, 1926-28), indispensable because of its clarity and accuracy of exposition, its comprehensiveness and its wealth of bibliographical material. In this work and in his teaching Oppenheim combined continental legal scholarship with the pragmatic approach of the lawyer versed in English common law. He was a positivist in insisting that only custom and treaties are sources of international law and that the introduction of any ideas of natural law must be unscientific. His approach was based upon the dualistic theory of Triepel and Anzilotti, according to which international law and municipal law constitute entirely different systems, so that a rule of the former can never per se become part of municipal law but requires a municipal act. Accordingly he held that individuals are never subjects but only objects of international law. Recent theory in international law has to a large extent abandoned the extreme positivism which essentially affirms the doctrine of state sovereignty in the international sphere; on the question of subjects of international law there has been an increased tendency to attach weight to Westlake's view that ultimately the rights and duties of states are rights and duties of men. Oppenheim, whose cautious positivism did not prevent his adherence to pacifist ideas, seemed himself inclined in his last years to modify his attitude. Although in his treatise he insisted repeatedly that there is not and never will be a central authority above the states, nevertheless in *The League of Nations and Its Problems* (London 1919) he was emphatic that withdrawal from the League should not be possible—which seems very near to recognizing such an authority.

H. LAUTERPACHT

Consult: Whittuck, E. A., in *British Year Book of International Law*, vol. i (1920-21) 1-9; Gregory, C. N., in *American Journal of International Law*, vol. xiv (1920) 229-32.

OPPORTUNISM is a disposition to allow conduct to be shaped by circumstances rather than by fixed principles. The term was first applied in political writing to the policy of Gambetta, who differed from the intransigents in his willingness to sacrifice certain republican principles in order to secure an immediately practicable measure of republicanism in France. Thus the problem of opportunism, like that of intransigence, has its roots in the troubled question of the relations between what is and what ought to be. Ideals and principles originate in

the limitless realm of intellectual creativeness, but their field of operation lies within the strictly limited world of fact. This gives rise to a tragic conflict. Since individuals vary in the intensity of their response to normative considerations, this conflict does not affect all persons equally. Some remain virtually untouched by it and concern themselves primarily with utilizing current opportunities for purposes of material advantage. Such action, being wholly dissociated from questions of principle, is opportunistic in the most absolute sense. Consequently there is a tendency to use the term opportunist as synonymous with adventurer. This fails, however, to exhaust the possibilities of opportunistic action. Although certain principles remain in some degree dear to most people, they cannot usually be given great practical effectiveness without a measure of accommodation to the superior force of hostile external circumstances. Intransigents are relatively unwilling to make such concessions, even though their refusal may entail certain failure. Others, feeling that some practical progress must be made, are ready to countenance action in violation of their principles in order to secure ultimate success. They are opportunists but to a lesser degree than the absolute opportunists, for their opportunism finds its ultimate sanction in that it serves principles.

Opportunism has been a constant phenomenon in political history, but in its development political theorists have played a minor role. Adventurers flourish in the world of fact but usually without benefit of theoretical encouragement. The problem of relative opportunism, however, has provoked considerable theoretical discussion, realistic political thinkers from Aristotle onward having been interested in discovering the natural limitations of normative activity. Occasionally these theories, going beyond the mere description of existing practises, have contributed actively to the course of history. When new ideals are striving in a period of rapid change to assert themselves against overwhelming obstacles, the need for a relative freedom of action may lead theorists to undertake a systematic justification of opportunism. During the political and religious troubles of the sixteenth and seventeenth centuries, for example, there arose theories, like the doctrine of *raison d'état*, which maintained that certain ultimate political or religious values might justifiably be defended by the ruthless utilization of all available resources. Foreshadowed by

Machiavelli, whose interest in political technique was in the service of an ardent nationalism, the idea of *raison d'état* received wide currency through the writings of Botero and others and contributed directly to the rise of the absolutist state. Similar movements appeared within the church, particularly among the Jesuits. By concentrating upon the problem of practical success these theories encouraged freely opportunistic policies in an age which was already disposed to look upon the end as justifying the means.

The rapid social changes of the past century have led to a similar intensification of opportunism in modern life. To an even greater extent than in the sixteenth century, however, conscious intellectual factors have played an active part in this modern historical development. A severe questioning of all established religious and scientific dogmas has led to a widespread disillusionment as to the validity of fixed principles. In his superbly expressed distrust of the practicability of the rationalistic doctrines of the French Revolution Burke became the forerunner of a large school of thinkers who consider empirical action more important than systematic principles. William James' "Damn your absolute!" illustrates a typical modern attitude which is characteristic of the whole pragmatic movement. The increased preoccupation with results in the realm of fact provides a broad basis for opportunistic policies. But this growing distrust of principles has not generally resulted in unprincipled opportunism like that of the Greek sophists. In fact it has been accompanied during the past century by a remarkable growth of group loyalty, and moral sentiments receive their expression in the exaltation of the Marxist ideal of the class and the Fascist ideal of the nation. The current trend in morality is to insist upon unquestioning devotion to a group, but the distrust of rational programs has concurrently led to a belief that the interests of the group are best to be served by empirically determined action judged solely on the basis of practical effectiveness. This position is particularly explicit in the theories of Italian Fascism, and the supple adaptability of the career of Mussolini is in itself testimony to the increasing sway of opportunistic policies in recent times.

Opportunistic theories and policies emanate most frequently from radical or reform groups. It is true that conservatives, being desirous of maintaining the status quo, have little respect for normative considerations, which always have

a reformatory tendency. In holding to a cautious but free empiricism to secure true social progress Burke expresses a distrust of theories which has been typical of conservatism. Thus in so far as conservatives have any active policy at all it is usually characterized by an opportunism wholly devoid of doctrinaire misgivings and tempered only by a devotion to tradition. But since conservative strategy is ordinarily concerned rather with preventing than with initiating action, the practical influence of this conservative opportunism is kept within comparatively narrow limits. Radical action, on the other hand, is inspired by devotion to certain reformatory principles, although such devotion may range in intensity from the polite discontent of municipal reformers to the passionate fervor of Jacobins and Marxists. A painful sense of the divergence between what is and what ought to be incites the radicals to determined action. Under this pressure the inertia of the established system soon becomes apparent, evoking in some individuals an intransigent attitude tinged with the pride of despair. An overwhelming desire for effective action, however, forces most reformers to tolerate varying degrees of opportunism. This is one of the most frequent causes of dissension within radical groups. Pre-war French syndicalism was rent by the conflicts of reformists and revolutionaries; modern Marxism is torn by the animosities of socialists and communists. Such divergences are based on a difference of opinion as to the extent to which it is necessary and desirable to tolerate opportunistic compromise and delay in order to attain the desired ends. Even the most extreme, however, are forced to wait to some extent upon the appearance of favorable circumstances. The fact that the French Jacobins, despite their ardent republicanism, ruled autocratically when circumstances jeopardized the achievements of the revolution, shows that opportunism is compatible even with fanaticism.

Opportunism is an important factor in social evolution, but its effects differ according as it is practised by the government or by the opposition. When it appears in the conduct of persons in power, it is a moderating force tending to safeguard social continuity and to minimize the violence of social change. Since traditional institutions are among the hardest obstacles to reformatory action, an opportunistic policy, on the part of reformers, of accommodation to existing circumstances involves certain concessions to the established traditional order. In-

novations directed toward reform are thus interwoven with traditional elements despite the stricter demands of radical theorists, with the result that reform movements are seldom as catastrophically thoroughgoing in their actual achievements as in their aspirations. Consequently a measure of social continuity is preserved. The practise of opportunism by persons not in authority, on the other hand, facilitates social change. The uncompromising attitude of an intransigent opposition not only thwarts its own efforts but also retards all other attempts at innovation. To the extent to which the supporters of rival principles are prepared to adapt themselves to the demands of a superior power the possibility of revolutionary action by the government is increased. The scales are weighted in favor of established political authorities because of the fact that there is always a considerable floating population of adventurers who are ready to share in the fruits of success. Consequently the government has little need to subject its policies to opportunistic dilution unless it must reckon with the intransigence of the opposition. In contemporary Germany, for example, the Nazis would have advanced much less swiftly toward the totalitarian state if the opposition had been inspired by a suicidal fanaticism rather than by an opportunistic desire to make the best of a bad bargain. But since it is a commonplace that the possession of power has a moderating influence and that unpractical fanaticism is most usual in opposition groups, the preponderant force of opportunism is ordinarily on the side of evolutionary rather than of revolutionary development.

It is apparent nevertheless that certain dangers are inherent in opportunism despite the fact that it often represents a wise and necessary utilization of available resources. The sacrifice of principles may be the result of wise calculation, but it may also represent mere cowardice in the face of difficulties. Since the necessity for such a sacrifice is always a matter of opinion, opportunism may easily serve to disguise weakness. Furthermore reform movements depend on a certain spiritual exaltation which suffers from the shock of constant deviation from principle. The spiritual exhaustion consequent upon any long continued conflict with reality largely accounts for the fact that long lived movements tend to become increasingly opportunistic and to abandon specific principles. The minimization of principles in recent American politics is notorious, while the constant evolution of es-

established socialist parties toward a position of increasing moderation offers a characteristic although less extreme example of the same tendency. Party leaders are particularly susceptible to this form of exhaustion since the responsibilities of practical leadership familiarize them with opportunistic actions which are carefully hidden from the rank and file of the party. There is therefore a constant tendency for radical leaders to desert to more conservative parties, a phenomenon particularly characteristic of French and more recently of English socialists. If the principles at stake have inherent vitality they are reasserted by fresh reformatory groups, and as socialists move to the right they are replaced by communists and similar left wing parties. This process of the fading and renewal of reformatory impulses is as natural and necessary as opportunism itself. The danger lies in the possibility that the practise of opportunism, if allowed to play too extensive a role in the life of society, may create so widespread a sense of disillusionment as to inhibit the renewal of impulses to change. The health of society depends on the maintenance of a just balance between normative and opportunistic forces. The cessation of reformatory efforts leads to a decadent stagnation like that of imperial Rome and the more troubled Latin American republics, where history resolves itself into a chronicle of the exploits of adventurers. Thus a consideration of the problem of opportunism illustrates admirably the fact that the art of life consists not in simple choice but in the maintenance of an appropriate balance between conflicting forces.

ORESME, NICOLE (c. 1320-82), scholar, political theorist and churchman. Born in Normandy, Oresme studied theology at the University of Paris, became grand master of the Collège de Navarre in 1356, dean of the Cathedral of Rouen in 1361 and finally bishop of Lisieux in 1377. While knowledge of his life there is still incomplete and the details of his role at the court of Charles v are not clear, it is certain that his influence in the royal councils was great. Of his extremely varied works, including in their range theology, astronomy, mathematics, political philosophy and political economy, the best known and most important are his translations—the first in the French language—of Aristotle's *Ethics* (1370), *Politics* (1371) and *Economics* (1371), and his *Tractatus de origine et natura, jure et mutationibus monetarum*, probably written and translated into French between 1356 and 1361.

The originality of Oresme, particularly as a monetary theorist, has been affirmed and denied with equal fervor since the middle of the nineteenth century. The present consensus of opinion is that while he owed a great deal to the Aristotelian philosophy, he drew very little from the incidental treatment of monetary questions by the Romanist and canonist writers, and that the source of his theories must be sought primarily in the events and circumstances of the fourteenth century. Oresme opposed the feudal theory which made money the property of the prince and declared that its control belonged rather to the community. He traced the history of money, explained its economic role and severely condemned the practise of altering its value. In the second edition of his treatise, however, while he continued to deny to the prince the right to change the value of money, he admitted that this power might rightly be exercised by the Estates General in the common interest, so that his doctrine is less an affirmation of the desirability of monetary stability than a denial of the absolute power of the king. While in this respect he takes his place as a political theorist rather than as an economist, he did describe very clearly the economic effects of monetary fluctuations; his treatise appeared during a period when changes in the established value of money—between 1351 and 1360 the value of the *libre tournois* was changed seventy-one times—were causing increasing difficulties and popular protests, such as the rising in Paris under Étienne

Marcel; and it was largely due to his influence that Charles v promulgated the ordinance of 1360 which assured monetary stability for the succeeding twenty-five years.

Oresme's influence, although very sporadic, has been considerable. His translations of Aristotle continued to circulate widely throughout the following centuries; the Protestant polemics of the sixteenth century made frequent reference to one of his sermons on the need of reform in the church; and his monetary treatise was known to the early writers of economic monographs. But it was not until Roscher "rediscovered" this work in 1862 and Wolowski translated it into French two years later that modern scholars paid much attention to Oresme's theories.

ORGANIZATION, ADMINISTRATIVE.

Government is the complete process of discovering and converting human needs into human satisfactions. For purposes of scientific analysis it may be divided into politics and administration. Politics is the process of detecting needs, formulating purposes and securing the man and money power to realize them. Administration is the complex of functions, organization and apparatus adapted to the service of the purposes dictated by politics. Hence administrative organization is a means to an end sometimes perhaps not openly or honestly avowed; its form, direction and tempo are determined from the outside entirely, except for deviations caused by the personal resistances of administrators seeking unauthorized satisfactions. Aside from such deviations, administrative organization varies with the political ends,

the national environment and the character of the citizenry and the civil service.

Policy affects administrative organization through the amount, kinds and intensity of administrative activities as well as through the constant demand for economy and through the forms by which policy is expressed. Even when the size of the nation is discounted, political ends determine the magnitude of staff and budget, as is evident from a comparison of the United States, Great Britain, Germany, Italy and Soviet Russia. Sheer magnitude everywhere produces the problems and institutions of internal hierarchical control and inspection (since it is necessary to energize the mass in the service of the chief directorate), renders a day by day surveillance and comparison of productivity very difficult and consequently leads to routinization ("red tape") and the institutions to overcome it. Where the kinds of activity are diverse, and especially when they are many, the twin problems of specialization and cooperation arise. These various problems are everywhere perceived and tend to be more elaborately provided for in countries with the least experience in centralized control, as in Soviet Russia and in Italy, although such measures are applied only fitfully because of discouragement and lack of general tradition. By reason of the terrific and well nigh impossible task of control and audit laid upon the institution of control (Exchequer and Audit Department, Cour des Comptes, Rechnungshof, Gosplan) the future apparently lies with internal accounting within each separate unit, such as the syndicate or "trust" in Russia or the Port of London Authority in England. Such arrangements, nevertheless, involve a loss of central comparison and coordination.

Even more important, however, is the contemporary straining away from the compact group of state departments toward syndicates, trusts, authorities, corporations—enjoying varying degrees of independence of the central controlling body, whether cabinet or Soviet central executive committee. There is this perpetual strain to maintain the special creativeness of the crafts, with the harmonious development of the whole, a development attained more markedly in some countries than in others—in Italy as compared with France, for example—but everywhere transitorily rising and falling in effectiveness. One inevitable result is the creation in the administrative departments of technical advisory boards composed of representatives of the

various activities controlled, to advise, to comment upon policy and to cooperate in drafting administrative regulations.

The intensity of activity involves the energy and speed with which the object is pursued and affects chiefly the degree of centralization, considered both territorially and functionally. In Russia, Italy and Germany there is intense centralization mitigated only by certain environmental and human resistances. In England a midway course is followed: in the central administration the departmental activity is pursued independently with a fairly strict control (tempered by the very number of the departments) by the Treasury; in the central-local relations there is a complex and meticulous system of interaction between the local authorities and Whitehall, with over 75 percent of the authority lying with the latter; and in the municipalities there exists a system of cooperation between the departments which, it is generally felt, errs a little on the side of disintegration. In the United States, on the other hand, the decentralization is comparatively extensive, as is evident in the federal system, the place of the cities in the states, the relation of the numerous bureaux and departments to one another and to the Treasury and cabinet.

Where the intensity of politics is greatest, control of the staff is strictest, at least in intention and usually in reality; this is abundantly demonstrated in Russia, Italy and Germany. In Soviet Russia, the G. P. U. and the Rabkrin (Workers' and Peasants' Inspection) perform supervisory duties characterized by both subtlety and energy; in Italy, the *Milizia Volontaria per la Sicurezza Nazionale* plays a similar role. Such inspectorial bodies are not always part of the official administrative establishment; they may operate directly as the instrument of the dominant party. A further consequence of this impatient policy is frequent change of men, organization and apparatus and an emphasis on "elasticity" of policy and organization. Finally, impatience involves the whole problem of "administrative justice"; the more pressing the social task the readier is the body politic to vest jurisdiction in the administrative department and the more reluctant to allow appeal to the law courts. In Soviet Russia the judicial authorities affirm expressly that individual justice cannot be allowed to conflict with the ends of the state. Justice in cases involving social ends and not suits between individuals ought logically to be included as a branch of

administration, because the courts, in this particular field, are established in the long run to execute state policy.

Whatever the character and effects of the factors already analyzed, there is a ubiquitous demand for economy, which becomes increasingly strong in periods of economic stress and depression. Falsely used, the term means only a diminution of public expenditure. Properly defined, it is simply the best or least wasteful utilization of the available means, the objects of expenditure being given; as such it is equally consistent with more or less public expenditure. The result, in proportion to the wealth of the society and its traditions of probity, is a complex mechanism for comparing all competing demands for expenditure with one another and the total to be spent with the total national income. In western civilization the model in this respect, more or less effectively followed by other countries, has been the British Treasury; in Soviet Russia an altogether new form of economy has produced a series of institutions like the Gosplan (*q.v.*) and the Prombank.

The administrative organization is vitalized and controlled by various media of political expression. The oldest and most usual are parliaments. These, however, in proportion to the intensity of the desire for control, and especially because of the variety and detail of state activity, have lost or are fast losing their original form of control in plenary meeting. Instead they set up standing and special committees, the members of which can become expert in the particular field and the chairmen of which can function almost continuously as controlling agencies. The Weimar and other constitutions following the World War even provided for intersessional legislative committees for control of administration. Further the elements which directly give rise to political demands—the professions, industries, social groups—obtain representation outside the parliaments also and are given a special place in the advisory councils of the various administrative departments. Political parties act upon administration in the orthodox way, through parliaments; moreover and with at least as much effect the central and local party leaders are permitted to supervise and control administration from day to day, by receiving information and by direct representations to the governing politicians or the permanent officials. Nevertheless, it cannot be denied that the magnitude of modern state enterprise renders control in any detailed sense impossible; only

the main lines can be grasped and directed.

The most important environmental factors affecting administration are the economic system, technique, communications and area and sociological analysis. The administrative system responds to the economic system. In sparsely populated agricultural areas, as in parts of the United States, in the Soviet Union, in the south of Italy, in the less considerable provinces of France, the activities are fewer, less continuous and cruder than in the industrial areas. The twin factors of complex and specialized division of labor and demand for high productivity have produced in the great modern industrial countries an enormous and growing demand for a planned economy, implying the administrative control of investment, prices, import and export, standards of quality, output and labor, and stringent prohibition of strikes or lockouts. The economic system is the most important single influence upon present administrative organization and forms the principal "political" consideration.

The special technique of each service affects the size of the area most appropriate for its administration. Water supply, sewerage, town planning and roads depend upon geological formations. All these things, and many more, have their own laws, which can be ignored only if certain other satisfactions are thereby secured. For example, there may be no single special administrative area for electricity supply, because amalgamation with other areas will produce better coordination of policy, budgeting and popular control, although some of the economy promised by electricity technique is thereby lost. There is a constant struggle, in relation to the appropriate area of administration, between the claims of the technique of each service and all other political necessities.

The joint effect of area to be administered and available communications was recognized by colonizing Rome in its road policy. From the seventeenth century the centralizing monarchs of Europe pursued a similar domestic policy. Yet broadly speaking, until the last fifty years administration was necessarily decentralized or if centralized was inefficient in proportion to area. In England and the United States, the classic homes of local self-government, the impossibility of the rapid transmission of commands from the center and the difficulty of knowing promptly enough the true state of affairs in the localities made local self-government a necessity. In czarist Russia, where with

even more primitive communications a policy of autocratic centralization was nevertheless enforced, the government of large areas was entrusted to officials who could not be effectively controlled by the central authority. The British Empire was possible because the sea made communication comparatively easy, but the case of Warren Hastings and the loss of the American colonies illustrate its limitations.

The revolutionary changes in communication in the last century have altered the relation between central and local government. It has become possible for the central government to be present closely and continuously in all localities and its controlling power has been considerably extended thereby. It is easier for the British Empire to be governed than ever before, and the authorities in Whitehall increase rather than decrease their powers and complicate their central machinery. Imperial committees, conferences and agents are much more numerous and continuously operative than ever. The range of effective international administration is made more and more extensive. Within each country deconcentration rather than decentralization characterizes central-local relationships: the local authorities are rather agents of the central administration than administrators of their own sphere of liberties. Yet, whether in modern England or in Soviet Russia, if the central authority demands the power to sanction local plans, it is still bound to obtain the advice of the municipal and regional councils before it makes its own plans.

Administrative organization responds to the acuteness of sociological analysis and is nowadays very much dependent upon statistics. In almost every form of administration there are departments of scientific research and statistics, and each individual department also has statutory powers and administrative arrangements for gathering information. Often information is collected on a world wide scale by institutions like the International Labor Office and the agricultural institute in Rome. Even more important is the responsiveness of administration generally to the results of analysis. Once a fact, especially a mathematical relation, is established, the object of administration can be defined accurately and waste of effort and inappropriate apparatus can be avoided.

Human factors affect administrative organization. Where citizens and officials are themselves self-governing and dependable, as in the United States, England and Germany, there is

less necessity for central interference, inspection and written regulations. Widespread ignorance nullifies the efforts of the officials; since ignorance is relative to the difficulty and complexity of administrative tasks, a whole apparatus of publicity has recently been created to let the citizen know what is to be done for him, the difficulties involved and what part he can play. To make the whole administrative apparatus fool-proof, automatic signs and reactions are established, such as standards of textbook costs, rates of poor relief, methods for testing the means of applicants for relief, forms for reporting quantity and quality of work done. No country has been able to achieve its political objects without very careful attention to the pay, conditions of work, discipline and rights of the body of servants (*see* CIVIL SERVICE). In the end it is the efficiency of the men rather than the logic of the organization which tells.

One of the problems of administrative organization is that of maintaining a continuous adjustment between the administrative organization and the efficient and economical performance of the tasks assumed by the government. Because of the slow accretion of government functions, the difficulty of prediction concerning the ultimate importance or the most significant phase of a particular activity and, especially among the states in the United States, the tendency for new activities to be allocated to independent officials and boards, administrative organizations which originally may have been functionally correct and efficient tend to develop overlapping, conflicts of authority and illogical distribution of functions as between the different departments. By the first decade of the twentieth century New York state had some 150 governmental agencies substantially independent of the governor. In the United States government partial adjustments had been made at the time of the creation of new departments in 1849 and in 1903, but there was no thorough reorganization.

The rapidly increasing governmental costs and the development of the efficiency movement in private business turned attention about 1910 toward the governmental administrative organization. President Taft in that year appointed a Commission on Economy and Efficiency, whose reports, presented in 1912 and 1913, while they had no immediate effect, served as the basis for several reforms in the next two decades. At the same time a strong movement for state administrative reorganization produced two mod-

els, that of Illinois (1917), which tended to concentrate the administrative organization in a hierarchical structure culminating in the governor, and that of New Jersey in 1915, based on the creation of semi-autonomous agencies. The Illinois plan, which has been adopted by seventeen states, including Massachusetts, New York, Ohio and Pennsylvania, has been aided by the short ballot movement (*q.v.*), which has aimed at the concentration of executive control and responsibility. Immediately after the World War the Congressional Joint Commission on Reclassification of Salaries called attention to the duplications and defects in federal governmental organization. The Congressional Joint Committee on Reorganization of the Administrative Branch of the Government, on which the president also was represented, was established in 1921; in 1923 it proposed a scheme for general administrative reorganization, but no general reorganization took place until 1933.

Attempts have been made in various countries to establish permanent bodies to keep constant check on the efficiency and logic of the administrative organization. Such was the Division (later Bureau) of Efficiency of the Civil Service Commission, established in 1913 as a successor to the president's Commission on Economy and Efficiency and set up as an independent bureau in 1916; in 1918 it was given power to investigate duplication throughout the government service, while the president was empowered to abolish such duplication after it had been reported to him by the bureau. A similar agency was the New York Department of Efficiency and Economy (1913-15). Soviet Russia has such an agency in the Rabkrin. On a local scale many municipalities in the United States have official or quasi-official bureaus of efficiency and bureaus of municipal research.

The problem of the principles of departmentalization arises most strikingly in cases of reorganization but also whenever new functions are being allocated to one department or another. The British Machinery of Government Committee in 1918 set forth two principal methods: according to classes or persons served and according to services to be performed. Of these the latter is generally recognized as the more logical. But no single principle can be followed without compromise, not only because of the elements of inertia and tradition which exist in all countries but also because of the real difficulty of determining the primary and most

important aspect of a particular function. There is often more than one aspect to the work of a particular agency; the task is to concentrate upon the most important, leaving the other as an element of duplication or compromise.

Administrative organizations geared to particular governmental ends may have to be partially reorganized or even in a measure temporarily superseded where the entire governmental energy is suddenly bent in a new direction. This is particularly true of war time. In the United States during the World War, a number of new regulative agencies were established and the necessity for securing effective coordination and integration of the administrative machine, new and old, resulted in the creation of the Council of National Defence in 1916, composed of the heads of the departments of War, Navy, Interior, Agriculture, Commerce and Labor. Furthermore under the Overman Act of 1918 the president was authorized to coordinate and consolidate existing bureaus, agencies and offices of government wherever in his opinion such action would be conducive to more efficient prosecution of the war; the powers so granted were, however, left practically unused by the president. Again in 1933, when with the inauguration of Franklin D. Roosevelt the energies of the country were turned to the task of overcoming the economic depression, Congress authorized the president in the interests of economy to reorganize the governmental departments. In the same year the president found it expedient to establish a supreme council, consisting of the cabinet members and the heads of the independent agencies established to aid economic recovery, in order to coordinate the efforts of these various agencies and to facilitate the transmutation of the formerly essentially laissez faire governmental machine into an effective agency of economic intervention and control.

Even more marked and more lasting is the change in administrative organization which results from a revolution which changes the class and economic basis of government. In Russia after 1917 it was necessary not only completely to replace an unsympathetic personnel but to fashion and integrate new administrative agencies which should serve the new ends of government. A similar administrative upheaval took place in Fascist Italy after 1921 and in Hitlerite Germany after March 5, 1933.

ORGANIZATION, ECONOMIC. Economic organization is the government of industry. It is the scheme of control by which enterprises are carried on and articulated into an economic system. It comprehends all the usages and arrangements, formal and informal, consciously contrived or adventitious, which present so much of an institutional answer as we have to such questions as what is to be produced, who is to share in the productive process, how the resulting goods are to be consumed, where power and discretion in industrial matters are to lie and how fully and to what good ends the human and material resources of society are to be employed.

In a literal sense there is no such thing as economic organization. In a society, real or hypothetical, in which it is the office of some great

man or dignified body to promote the material well being of a people clean cut lines of organization may stand out in sharp relief. Approximations of such a condition were involved in the conscious introduction by the elder statesmen of machine production and the factory system into Japan and the deliberate planning by the autocracy of the U.S.S.R. of the industrial progress to be achieved within a five-year period. But in general there has ordinarily been and there is throughout modern industrialism no constitution for the economic order, no established structure of industries, no prescribed pattern of economic functions, no industrial dictator or council of economic wise men, no program designed to make of wealth an instrument of social welfare. No individual professes to be an economic man or regards himself and his doings as an economic phenomenon. There are only rich men and poor men, plumbers and antiquarians, fishmongers and bond salesmen, researchers and realtors and morticians. The world of affairs is peopled with human beings who engage in human activity and whose conduct is human behavior. Economic organization is not a thing apart; it is an implication of man's entire life in society.

Yet, even if it cannot be detached from its cultural matrix, there is an economic organization. The individual housewife, mindful only of her own job, lays out the family income as well as she can; she purchases groceries, supplies, help and the like; converts her purchases into food on the table, beds which invite sleep, a home that gives family cheer; and practises the domestic arts poorly, indifferently or well. Housewives taken together, in determining whether family incomes are to yield much or little and in advancing or retarding the technology of spending, are performing an economic function. An engineer contrives a new machine, a business man joins others in a trade association, a university professor gives utterance to a novel idea, a commission approves a schedule of railroad rates, a legislature passes a securities bill, a court enlarges the province of government. Each is responding to the exigencies of a situation; each is within a limited domain of discretion doing a particular act. Yet in the myriad of such acts the great economic functions—feeding the people, providing them with the consolations of religion, maintaining the public health and educating the young—do get performed. In the ceaseless course of human events a countless number of systems under

which the material resources of society are ordered have emerged, had their brief day and passed. In the making of these deliberate intent has had its part, as when a Tudor England promulgated a statute of apprentices or a mercantile United States invoked an industrial recovery act; but for the most part they have just grown.

Institutions alien in time, place or opinion are uncertainly reduced to terms of modern knowledge. It is, as an instance, quite impossible to describe in the vocabulary of economics the schemes of use and wont in the pursuit of livelihoods which have prevailed among primitive peoples. To them the economic is not a thing apart even as an abstraction; its usages are intermingled with ceremonial, custom, the tribal mode of life and the established ways of the folk. The concepts which come glibly to our lips are dubiously applied to their institutions; the enjoyment of their communal possessions rests upon usage quite distinct from that of the real property of the common law; contract has a frail foothold in tribal life and exists without benefit of the legal and moral sanctions which currently support its "obligations"; trade has not yet emancipated itself from an exchange of gifts between friends to become a professional art of acquisition; the lending of moneys or of goods at usury is a slick trick to be tolerated only when practised upon strangers. For the most part the daily and seasonal round of toil and enjoyment is a ritual, encrusted in tradition and yielding slowly and uncertainly to communal necessity. The place of the individual in the group is fixed by status; the division of labor runs along lines of age and sex; the prevailing ideas of what is customary or "right," and not a demand as registered in the market, determine what is to be produced and how it is to be distributed and consumed. Where the devices and procedures of a pecuniary economy are in vogue, they are as likely as not to be established about some non-industrial activity. In the ordinary ways of winning from the environment a precarious living—the gathering of fruits, the stalking of game, the tilling of the soil—there is a great ceremonial, which envelops technology in routine and magic and is a worship, a government and a mode of tribal life as well as a rule for industry. The usages which govern primitive life have been put together in endless permutations; but nowhere within this medley of bewildering color and miscellaneous variety is an autonomous economic order to be discovered

In classical antiquity, among the Hebrews, the Greeks and the Romans, trade or commerce did exist in its own right; but in each instance it had its distinct place in the social economy, was pent in by the opinion, the morals and the law which prevailed and derived its function and its character from the impinging culture. It is quite misleading to give a picture of the economic order among the Greeks by culling "relevant passages" from Plato, Xenophon, Aristotle and other contemporary writers and garnering the notes into the categories of John Stuart Mill or Alfred Marshall. In the social structure the lines between the political, the economic and the religious broke in a distinctive way; an attempt to recapture Greek economics, even as an abstraction, must take into account the pattern of Hellenic culture. In the Middle Ages economic organization was an unrecognized and undifferentiated aspect of a landed and ecclesiastical social establishment. Modern industrialism is as conglomerate in character as it is adventitious in origin. It contains usage, arrangement and procedure from far and near; its sprawling lines bear the impact of circumstance and expediency which are gone. Yet the system as we know or think we know it goes back little more than a century, has been almost remade in the lifetime of the present generation and is being transformed before our very eyes.

A process of institutional development has neither a temporal nor a logical beginning; yet the character of the modern economic order had already begun to take shape in Tudor England. In the mediaeval regime each man was bound to his overlord, each individual to his land, by personal ties. As status lost its sanctions, the equities in the land, once shared between lord and laborer according to ancient usage, were monopolized by the lord, who became the "owner" of the "property." The equities in the service of the worker, once shared between laborer and lord, became the exclusive possession of a now free laborer. Out of a petty trafficking, carried on along the fringes of polite intercourse, arose the usage of contract as the means through which free labor and private property were associated in the productive process. A folk set in its ways was habituated to the usages of the pecuniary calculus, learned to express comparative values in its terms with meticulous exactness, developed a preference for the greater over the lesser magnitude and brought industry and trade under the domain of the money economy and profit making. As a result

units of human and material resources, for practical purposes made comparable by pecuniary notation, might variously be combined into productive operations. In a process almost fortuitous such usages as these emerged and were fused into the institution of free enterprise. It is the product of the rise of a system of petty trade in an agrarian economy. Its pattern became fixed through the rise of an industrialism too vital to be stayed and too turbulent to be controlled.

In the United States in less than a century the economy of small farm and petty trade was transformed into the great industry. For the most part scientists, inventors and business men were responsible for the innovations; but it is difficult to picture them as conscious revolutionists fomenting rebellion against the established social order. Innocently as it was begun, the machine got the run of the workshop, made a factory out of it and stripped the worker of his skill. Man escaped from his place in the home, found a refuge in office, store or factory and quickly forgot that from time immemorial until yesterday his had been a domestic occupation; and, after a decorous period, woman began to follow him. The farmer, the bulwark of the old system, was dragged into the new, began to produce cash crops for distant users and came perforce to be a business man. After the reputable customs of the commercial world he began to speculate upon an increase in land values. Out of bargaining, a manly and loquacious procedure which had served a casual trade well enough, was created an intricate and unarticulated structure of markets, credits and accounts. A cheapening of the cost of transport enlarged trading areas and localized industries. In the wake of the machine came a division of labor as comprehensive as the continent; no longer could any family be self-sufficient; it went to market with its vendible services and property and brought back a living which came from the ends of the earth. An aggregation of farms and crafts gave way to a none too orderly articulation of interlocking industrial activities. It is hard enough to write down the initial date of this transformation; it is impossible to fix the terminal one. At the turn of the century the moving picture and the automobile were engaging toys; at present they are being woven into the very fabric of our culture. The possibilities which lie in such diverse things as quantity production, urban decentralization, the use of the corporate device, the simplification of the structure of

ownership, the distribution of the equities in property and the use of hours snatched from an overlong workday are beginning to be explored; and among the folkways of industry, big and little, revolutionary change is imminent. The iron man and the adding machine go their relentless way; and with them things established must patch up the best truce they can.

In the wake of such a social transformation one could scarcely expect to find a simple, autonomous, purposive economic order. As a product of all of idea, circumstance and expediency which it has met the prevailing economic order is sprawling and conglomerate as well as purposive and tidy. Into its emergence has gone some foresight, a bit of intermittent tinkering and a lot of undirected development. It is the kind of organization which is created by time, chance and the continuous concern of countless individuals with their own affairs.

In this economic order three principal agencies of control are employed to make productive processes serve human wants. Of the three—the family, the state and business—the oldest is the family. Until recently its domain comprehended almost all industrial activity; now its shrunken province is the rearing of children, the maintenance of the home and the carrying on of surviving household techniques. Its guide to action, however the abstractions may in practise be interpreted, is “from each according to his ability, to each according to his need.” Its customs are being remade by the world without; the domestic altar, the stern discipline, the fire-side determination of the destinies of children, have already departed; long ago it substituted ready to use for homemade goods and borrowed the keeping of accounts from business; and today efficiency and standardization threaten to industrialize the kitchen. But even if the family is not the family it used to be, its dominance remains. The household workers, if they have not risen to the status of wage slaves, are still the largest group of laborers even in the United States; and the “value added” to goods by family activity, if it could be set down as a pecuniary sum, would make the railroad or the banking industry small by comparison.

In the direction of industry the state occupies a somewhat smaller domain. From time out of mind such activities as the maintenance of peace, the national defense and the coinage of money have been under its control. In recent times such enterprises as the postal service, the provision of education and the prosecution of

scientific research have been added; and the development of the internal combustion engine has made the maintenance of public highways a major industry. The state has too—directly or through subordinate authorities—operated banks, waterworks, power plants, street railways, merchant fleets, insurance companies and other utilities. In periods of depression it has set up emergency corporations to extend financial aid to private concerns and to help free enterprise over the hard places. In its industrial ventures the state makes use of money, keeps accounts and employs many of the devices of business. The service may be supported by a direct charge for use, as with the mail; an indirect impost, as upon gasoline for roads; or a general tax, as for schools. In the provision of services which cannot easily be measured in pecuniary terms or sold unit by unit in the market or which yield tangible values only in the indefinite future, the state holds its industrial province secure; but in the production of services immediately vendible there is always present the threat of the encroachment of business. The industries under state direction are organized in diverse ways; but a common mark of its oversight is the absence of production for profit. Its control is rooted in considerations of social need and public policy.

Although its domain is narrower than is commonly supposed, business is the most conspicuous of the agencies of control in the modern economic system. It has for ages dominated a province on the fringe of industry; yet it is but lately that the tradesman, who in the Middle Ages was a casteless rascal, has become a captain of industry. Where business rules, each person must secure his living by selling his services or the use of his property and by purchasing goods in the market. Each is legally free to produce and consume, to buy and sell. The only constraint is that whatever one does—manufacture merchandise, sell labor, borrow moneys or hawk wares—one must compete to some extent with others. The rivalry is a double competitive process: the rivalry between sellers keeps a price from being too high and that between buyers prevents it from being too low. The desire to pocket a gain is the bait that lures individuals into industry; competition is “the invisible hand” that holds profit making in leash. As prices in response to changes in demand or supply go up or down, producers increase or decrease their output and are drawn into more productive and repelled from less productive

industries. All of this is accomplished, not by the "automatic operation of economic laws" but through a myriad of judgments of a million human executives, who differ one from another in ability, knowledge and understanding. With what promptness or delay, efficiency or waste, business accommodates the industries under its direction to the general welfare, it would require a comprehensive and detailed inquiry to reveal.

But the use of such words as family, state and business to describe schemes of control is over-abstract. No one of them is a simple, autonomous bundle of arrangements. Business comprehends monopoly and competition in various permutations as well as pure competition. Competition itself is not of a type; a trio of village grocers and a million cotton growers are alike engaged in competitive enterprise, but the arrangements under which the two groups carry on have little in common. A cartel may be organized in ways as diverse as the German coal monopoly or the Stevenson control of rubber; the focus of its concern may be sales, production or capacity; its activity may be limited to the current season or may project many years into the future. State enterprise comprehends the mails, the army and navy, public schools, universities and the highways; yet it would require a ponderous tome to recount the devices and procedures which make their schemes of control so different. Even nationalization, for all of its polysyllables, is a word of mighty import but little specific meaning.

Moreover it is impossible to discover pure patterns of industries under a single agency of control. The rule of the family is pent in by the law, the church, the prevailing morality, the mores of the neighborhood. The operation of competition is compromised by the trade association, the labor union and the customs of the industry. Since a mercantile venture must remain solvent, it has to submit to the tyranny of the market, which registers the demands of the family for articles of consumption. The state extends its diligent or negligent oversight into every business venture. Whatever the word of shorthand employed, in the organization of every industry there are places for a number of different groups and agencies. List all the questions which must in some way get answered if an industry is to carry on, ask in each instance where discretion lies and by what procedure the decision emerges, attempt to reduce the composite result to a blue print, and the result will give some idea of the complexity of use and

wont which makes up a scheme of control. If to current examples constructive proposals be added, the bewildering variety provokes despair over the prospect of finding types among forms which bear a common name.

But analysis must be pushed even further if an organization is to be broken down into its elements. A going industry, with the many sorts of activity its conduct entails, is an intricate affair; the accommodation of its technical processes to human wants calls for the doing of many specific things, each of which demands its distinctive mode of accomplishment. It brings into being devices, procedures and understandings of many different kinds and useful for many different purposes. Each has an identity and a concrete task, works with a degree of perfection and, within the tolerance fixed by the others, may be amended or replaced. A process of borrowing is constantly going on; business takes over the procedure of deliberation from the government, and education in spite of state control puts on the pecuniary habits of business. These elements of order may roughly be grouped into the mechanical, which are of use in keeping an activity going, and the purposive, which determine where discretion lies and what ends it serves. The device of the corporation is mechanical; universities, learned societies, hospitals, religious brotherhoods and even activities of the state are carried on under this flexible form. But the procedure for choosing the board of directors is purposive; for in the selection of the governing body, whether by owners of securities, investment bankers, business buccaneers, industrial workers, consumers, public spirited trustees or officers of state, lies the making of policies. The device of dubbing goods with prices is mechanical; it is employed under competition or monopoly, regulation by commission and by state socialism. But the quest of profits is purposive; it fixes the goal of enterprise, makes the attainment of other ends a matter of indirection and has not a little to do with who gets the good things of life. Always, everywhere, the generality of procedures and arrangements serves for the doing of particular tasks, while the select few give character and purpose to the larger enterprise. In many instances elements from different sources have been incongruously compounded into schemes of control. A classic example is the organization of medicine, which rests upon usages as distinct as a code of ethics of guild origin, the private practise of the profession and state supervision of public health.

At best an organization is an instrument rather than a guaranty of economic order. If the devices which make it up have been well contrived, skilfully put together and neatly adapted to technical processes and social ends, it gives a chance for wise decisions and makes for a well conducted industry. If the elements are crude, if the blend is inharmonious and the control a patchwork of discretions, it puts the direction of affairs outside the reach of those in authority. But, whatever its excellence, an organization is merely a structure within which things are to be done and not a panacea against disorder. Corporations employ officials as well as charters; courts require judges as well as statutes; churches must have ministers as well as the consolations of religion. An organization, regardless of its qualities, cannot be made to yield results if those in power are incompetent.

The place of the economic order is intermediate between the technical and the moral orders; its office is the creation of arrangements under which the material resources of society will most "economically" serve human wants. It is easy enough to resort to logical analysis, to assume a homogeneous competitive system, to make the laws of supply and demand do their mechanical tricks and to prove that industry provides about all that it can be made to give. But inquiry into the operation of the economic order has made difficult the way of simple explanation and of grand apology. In spite of the march of dialectic the single fact that the standards of life for the masses of men are needlessly low while almost every important industry has a large surplus capacity to produce stands out with startling significance. In an attack from within upon the sources of disorder business men, laborers and consumers have resorted to collective activity. From without the state has with increasing frequency interfered to fix "a plane of competition," to help industries in distress and to take over activities which were too much for private enterprise. The lack of adjustment between production and consumption, the alternation of prosperity and depression, the anomaly of factories closed and a people in need and the paradox of actual want amid potential plenty have affected the organization of industry with a public interest. At the same time there has come a consciousness that economics is an art; that an industrial technology cannot efficaciously be crowded into arrangements which grew up to meet the needs of petty trade; and that its backwardness must be overcome by revi-

sion and contrivance, discovery and invention. A belief in the possibility and the necessity of economic planning has become reputable. It has taken the shock of maladjustment to make it so, but a recognized art of economics is at last getting down from the general to the particular. Its task is to do for the organization what the industrial arts have done for the technology of production. In the contrivance of a control for an industry and in fitting industries into an articulate and purposive system there is opportunity for endless choice; only the finiteness of man's intelligence and the modest capacity of groups to accept new disciplines fix the limits. The economic order which is already emerging may be socialism or capitalism, state capitalism or business socialism; but such elusive terms are for philosophers, propagandists and crusaders. They can never be made to describe the colorful combinations of devices and understandings which constitute the coming industrial control.

At present the art of economics seems to be the key to the enigma of social welfare. A while ago, when births were not yet under control and Mother Earth had supplied just so much and no more as the source of our livings, a scarcity economics was a part of the order of nature. But as the industrial arts come into the place once occupied by "the niggardliness of nature," it is difficult to impose upon them blame for the inadequacy of our livings. An unimpeachable alibi is presented in the inherent capacity of the prevailing technology to turn out goods vastly in excess of contemporary performance. The responsibility rests squarely upon an organization unable adequately to perform its mediatorial office of making the potential wealth serve the welfare of society. What the ultimate limits imposed by nature upon the production of goods may be no one knows; but for the pragmatic present the barrier which shuts off abundance is the backward state of the economic arts.

All of this describes the character, presents the structure and defines the function of economic organization. It is not a separate and distinct thing, like a square on a checkerboard that has a jurisdiction and a law all its own. Instead it is an aspect of all life and all culture. There was a time when students spoke convincingly about keeping the existing order or hopefully about establishing a new one. But the system which the timid would keep has already gone; and the utopia of the reckless is not to be had through a single heroic act of creation. All that

a people can do is to shape as intelligently as they can a change which is inevitable. The old order—or disorder—may be destroyed by its friends who are attempting to save it; new arrangements may creep in by stealth masked by ancient custom until they are too powerful to be stayed; a revolution may clear the way for the detail of innovation. Persons in strategic positions will play important roles in the course of events. But the texture, the detail, the color which gives character to a group of usages, are the product of every man's concern with his everyday affairs. As an institution economic organization is a work of communal authorship.

ORIENTAL IMMIGRATION. Immigration of orientals to white countries and to non-Asiatic territory under white control began about the middle of the nineteenth century when laborers from south China found their way to the gold fields in California and shortly thereafter to those in Australia, New Zealand and British Columbia. Compared with the oversea migration of Europeans it has been numerically small but politically significant. Scarcely more than 1,260,000 Asiatics, including descendants of immigrants, reside at present in territory outside Asia and its neighboring islands; this figure comprises about 650,000 Asiatic Indians, 400,000 Japanese and 210,000 Chinese. The Indians are almost wholly confined to British territory in South America, the West Indies, south and east Africa and the island of Fiji. Chinese and Japanese, the only orientals found in considerable numbers in predominantly white settlements, have made their homes chiefly in North and South America, Australia and New Zealand. Except for officials, a few merchants and students, oriental immigration to Europe has been negligible.

With the abolition of slavery throughout the British Empire in 1833 and the subsequent extensive development of plantations, Indians were shipped to British Guiana, Trinidad, Jamaica and later to Natal and Fiji. Likewise after the treaties with China (1839-44) Chinese coolies were transported to Cuba, Peru, Chile, Hawaii and in the early part of the twentieth

century to the Transvaal. As recently as the World War Chinese coolies were shipped to France and England in order to release native labor for military service. This transportation of unskilled labor under indenture or contract has, however, been of secondary importance because of its declining frequency and the fact that it has usually been followed by repatriation. It is with the rise of spontaneous migration directed for the most part to the pioneer belts of white settlement fringing the Pacific that oriental immigration has assumed its chief importance as a political and socio-economic problem.

The movement to the United States, stimulated by shipping companies and labor agents as well as by the distress prevailing in the Canton region following the foreign wars and the Taiping rebellion, started about 1850, the census of that year recording 758 Chinese immigrants, 660 of whom were in California. The first significant immigration occurred in 1852, when some 18,000 Chinese arrived in San Francisco, which at that date had fewer than 37,000 inhabitants. Thereafter the inflow was rapid, fluctuating considerably from year to year but averaging about 5000 annually; in 1869 the number of arrivals suddenly increased to 12,874 and in 1870 to 15,740. For the next two years the stream fell off by half, but it rose again in 1873 and maintained a yearly average of about 16,000 until stemmed by legislative action in 1882 which shut off the immigration of coolie labor. It is estimated that approximately 375,000 Chinese entered the United States during the entire period of immigration. Facts as to the return movement are not available until 1908, but from then until 1930 the aggregate number of departures exceeded arrivals by over 20,000. The Chinese population of the United States, including American born, declined from 107,475 in 1890 to 61,639 in 1920. The 1930 census records 74,954 Chinese in the country; the increase over the preceding decade may be accounted for in part by an excess of births over deaths and in part by a more accurate enumeration in the later census. The Chinese population of Hawaii has remained almost static since 1900 and is now approximately 27,000. Since the beginning of the twentieth century the Chinese in both the United States and Hawaii have concentrated in the larger cities and are engaged chiefly in the restaurant and laundry businesses.

Agitation against the Chinese began in California shortly after the arrival of the first immigrants and took the form of race riots and local

legislative restrictions. The shortage of labor created by the Civil War and the construction of the Union Pacific Railroad in the years immediately following caused, however, a temporary subsidence in the anti-oriental sentiment and also an increased inflow of Chinese immigrants. In fact the optimism engendered by the advent of transcontinental communication and the anticipated extended trade with China paved the way for the Burlingame Treaty of 1868, which, among other things, recognized the reciprocal rights of Chinese and American subjects to emigrate to either country at will. Scarcely was the treaty signed when a crisis arose. The completion of the transcontinental railroad in 1869 left thousands of Chinese without employment. Moreover this new avenue of transportation caused so enormous a movement of white settlers to California that in the winter of 1871 it is estimated that there were three men for every job. Local newspapers and labor leaders launched a crusade against the Chinese, who after the decline of mining and railroad construction had begun to seek occupational outlets in agriculture and domestic service. Numerous state laws, designed to stop immigration and to impede the activities of resident Chinese, were introduced but without avail.

The legislative outcome of this troublous decade of interracial strife was the treaty of 1880, a modification of the Burlingame Treaty, by which China recognized the right of the United States to "regulate, limit, or suspend . . . but . . . not absolutely prohibit" the immigration of Chinese laborers. This treaty paved the way for the Chinese Exclusion Law of 1882, which at the time merely suspended the immigration of Chinese laborers but which through subsequent changes and amplifications really marks the inception of Chinese exclusion from the United States. As soon as the Hawaiian and Philippine Islands came under American jurisdiction, the Chinese exclusion measures were applied to those territories also.

Canada's experience with Chinese immigration closely parallels that of the United States. Arriving in the early 1860's in response to the discovery of gold at the mouth of the Fraser River, the Chinese played an important role in the development of pioneer settlement in British Columbia. They constituted the leading source of labor for the construction of the western division of the Canadian Pacific Railway, some 16,000 having been employed in 1884. The completion of the railroad the following year

resulted in acute unemployment and race riots, a situation which the provincial government attempted to meet by local restrictions against the Chinese. The dominion government intervened and imposed a head tax of \$50 on Chinese immigrants, raising it in 1901 to \$100 and in 1904 to \$500. Even this did not suffice to curb the inflow. In 1913 the arrival of 7445 Chinese brought about an order in council temporarily stopping immigration. At the close of the World War the number of entries increased, and in response to a protest from British Columbia the dominion government in 1923 passed the Chinese Immigration Act, which excludes all Chinese from Canada except certain specified exempt classes. The Chinese population of Canada in 1921 was 39,587, mostly residents of British Columbia.

Oriental immigration to Australia began during the years 1853-54, when some 2000 Chinese sought work in the Victoria gold fields. By 1859 they had increased in number to 42,000 and had spread to the placer mines in Queensland, New South Wales and South Australia. Agitation against the Asiatic arrivals developed almost at the beginning of their immigration. In 1855 Victoria imposed an entry tax of £10 on each Chinese immigrant and limited the number who might arrive on a vessel. By 1886 almost every Australian colony had adopted legislative restrictions on Chinese immigration, but it soon became apparent that concerted action was necessary in order to cope with the problem. The need for uniform exclusion laws was instrumental in bringing about the federation of the Commonwealth of Australia in 1901. During that year the Commonwealth Immigration Act was passed, which by subsequent amendments excludes all Asiatics by means of a severe language test. Since the passage of this act the only Asiatics who have entered Australia are those belonging to the exempt classes. By 1921 the Chinese population of Australia had declined to 17,157, the number of departures in recent years exceeding the number of entries.

In 1871 there were 4215 Chinese in New Zealand, 3570 of whom were in the gold fields of Otago. In its legislative policy regarding Asiatics New Zealand has followed the example set by Australia. In 1881 a head tax of £10 was imposed on Chinese immigrants, and in 1896 it was raised to £100. A slight increase in the number of arrivals in 1920 gave rise to the act of 1923, which requires the approval of the minister of customs before entry to the domin-

ion is allowed. The estimated Chinese population in New Zealand in 1932 was 2719.

The trans-Pacific migration of Japanese did not begin until after the Chinese had been practically barred from all the English speaking countries of the Pacific. The movement has been confined almost entirely to Hawaii, to the Pacific coast of North America, to Brazil and Peru. The emigration of Japanese laborers was not legalized until 1885, in which year an arrangement was made with the Hawaiian government for the importation of laborers to work on the sugar plantations. After 1900 the migration to Hawaii became spontaneous and increased in volume until it was voluntarily restricted by the Japanese government.

The United States census of 1890 listed 2039 Japanese; that of 1900, 24,326. During the decade 1901-10, 54,834 immigrants arrived directly from Japan and many others entered by way of Hawaii. The motive for this emigration, preponderantly adult male in character, was the superior economic advantages which the overseas settlements afforded. The new arrivals to the United States found ready employment as laborers in the rapidly developing truck gardening areas, as section hands on the railways and as domestic servants. Some gravitated to the logging camps and salmon canneries in the Pacific northwest.

Opposition to this new oriental group began in California in the late 1890's, when organized labor and patriotic societies, formerly active in restricting Chinese immigration, turned their attention to the Japanese. In 1901 the California legislature passed a resolution to petition Congress to extend the Chinese exclusion laws to the Japanese. In order to forestall such action Japan temporarily stopped the emigration of its laborers to the United States and Canada. The consequent recession in immigration afforded a brief period of respite, but there soon developed a movement from Hawaii to the mainland which made up for the somewhat diminished stream direct from Japan. By 1905 anti-Japanese sentiment, stimulated no doubt by Japan's victory over Russia, became organized under the leadership of the Japanese and Korean Exclusion League, and bills were introduced in Congress barring Japanese immigration. The situation came to a head in 1906 when the San Francisco School Board passed a resolution requiring Japanese children to attend the oriental school in Chinatown, an action which provoked a vigorous protest on the part of the Japanese government.

In 1907 President Roosevelt by authority of Congress issued a proclamation forbidding Japanese who had received passports to Hawaii, Canada or Mexico to enter the United States. At the same time he consummated an informal arrangement with Japan, subsequently known as the Gentlemen's Agreement, whereby the Japanese government agreed to stop issuing passports to laborers seeking entry to the United States. Of its own volition Japan made the terms of the agreement applicable to Hawaii and Mexico. This caused a movement to Canada with the result that a Gentlemen's Agreement was reached between Japan and Canada restricting the number of Japanese laborers who might enter the dominion to 400 annually. This number was subsequently reduced to 150.

The result of these arrangements was a substantial reduction in Japanese immigration to Hawaii and the Pacific coast of North America. Indeed in the years during which the Gentlemen's Agreement was in effect there was an estimated emigration of 23,000 Japanese men from the United States and Hawaii. But this return movement was largely offset by the immigration of some 38,000 Japanese women. A considerable proportion of these entered as "picture brides"; that is, by means of photographs forwarded to Japanese laborers already in the United States, with whom marriages had been arranged by proxy. This immigration of women introduced a new problem in race relations on the Pacific coast. In order to establish homes and families Japanese laborers in increasing numbers acquired control of agricultural land, mostly as tenants but also as owners. The census of 1920 reported 31,471 Japanese in the farm population of California, constituting 6.1 percent of the total farm population of the state. Smaller but significant numbers of Japanese were recorded in the farm populations of Washington and Oregon. This invasion of agriculture brought the Japanese into competition with white farmers and resulted in the enactment of alien land laws under the terms of which aliens ineligible to citizenship are prevented from leasing or purchasing agricultural property in the Pacific coast states.

Meanwhile the birth rate of the resident Japanese increased rapidly, thereby introducing the additional factor of biological competition as a basis for exclusion. Accordingly after the World War, when national sentiment was intensified, the anti-Japanese forces on the Pacific coast succeeded in persuading Congress to include in

the Immigration Act of 1924 a clause which excludes from the country all aliens who are not eligible to citizenship. Although aimed directly at the Japanese, this act automatically applies to all Asiatics, as the courts have ruled that aliens of Asiatic race are ineligible to United States citizenship. Prior to 1924 Indians and south-western Asiatics had been excluded by the "barred zone" provision in the Immigration Act of 1917. The Japanese population of continental United States in 1930 was 138,834; that of Hawaii, 139,631.

The act of 1924 marked the close of an era of three quarters of a century of agitation against oriental immigration to the English speaking Pacific countries, an agitation based on the arguments of unfair economic competition, cultural and racial unassimilability and apprehension of the "yellow peril." The trend of opinion and of legislative procedure with regard to Asiatic immigration has followed a remarkably similar course in each of the areas concerned. Beginning with local conflicts and local legislative efforts to restrict the numbers and curtail the activities of orientals in the pioneer settlements, the movement gradually became widespread in scope and aggressive in character. The first national action took the form of treaties and restrictive measures designed to limit the inflow of laboring classes. But as the white settlements matured, racial consciousness emerged which found increasing expression in the exclusion of all orientals. So pronounced has this sentiment become that industrial interests which in the past were not unwilling to use Japanese and Chinese coolies as a weapon to combat the ascendancy of organized labor have found this policy no longer expedient. The "white Australia" movement, crystallized in the Commonwealth Immigration Act of 1901, eventually found an echo in all the other English speaking Pacific countries. The larger countries of South America are still open to orientals; since 1924 Brazil has been the chief oversea destination of Japanese immigrants.

While the white man has been erecting barriers against oriental invasions, real or imagined, Asiatic countries have not submitted passively. They have voiced repeated protests against the exploitation of their subjects and the national affront implied in discriminatory legislation. India's insistence upon equality of status for its subjects elsewhere in the British Empire and its refusal by the act of 1922 to permit the emigration of coolie labor except under government

sanction are evidence of this growing sense of national dignity. Japan has always shown concern for the welfare of its emigrants and has attempted to control their movements in such a manner as to escape the humiliating features associated with other oriental immigration. The 1924 exclusion act of the United States caused resentment in Japan not because it cut off an outlet for emigration but because of the racial discrimination involved. The equally effective exclusion methods adopted by Australia and New Zealand, based on literacy tests and applicable to all immigrants, have occasioned less offense to both Japan and China. During recent years, despite economic disturbances, antagonism toward domiciled orientals in the United States has to some extent subsided. This is evidenced by the fact that in 1930 labor organizations and other groups which had previously directed the campaign against Japanese immigration united with chambers of commerce to recommend an amendment to the 1924 act which would place orientals on a quota basis similar to that applying to European peoples. Such a quota law would allow an annual immigration to the United States of not more than 1000 Asiatics of different nationalities including 105 Chinese and 187 Japanese. It would allay the ill will engendered by exclusion and thus contribute to the amicable solution of one aspect of Pacific relations.

The characteristic problems which now arise in the countries of former oriental immigration pertain to the administration of the immigration laws and more particularly to the political and social status of the domiciled Asiatic races. The exclusion measures adopted by the various white countries make provision for the admission of specified classes, such as students, business executives and temporary visitors. Because of the wide differences in language and culture between the Occident and the Orient immigration officials frequently find it difficult to determine the actual status of applicants for admission. This problem is particularly complicated with reference to the Chinese arriving at American ports, partly because they are subject to the exclusion act of 1882 as well as that of 1924 and also because the Chinese government has not been in a position carefully to supervise the issuance of passports.

More important, however, is the problem of the civic and social status of the resident orientals. Most of the legal disabilities imposed on orientals during the period of active immigration

are still in effect. In the British dominions these pertain to the exercise of the franchise, the acquisition of citizenship and to minor questions such as eligibility to old age pensions. In the United States they apply chiefly to the leasing and ownership of agricultural land. In addition California and several other western states have enacted laws forbidding intermarriage between orientals and whites. Except for the inconveniences involved in the miscegenation laws, American born orientals, of whom there are some 40,000 Chinese and 163,000 Japanese in continental United States and Hawaii, possess all the legal rights of citizenship. Socially, however, they are not differentiated in popular opinion from other Asiatics, although in language and culture they are fundamentally American. The chief difficulty arises in connection with employment. A large number of American born orientals graduate from high schools and colleges only to find that professional opportunities are for the most part limited to their own racial groups.

A new factor in oriental immigration to the United States has been the arrival of the Filipinos, whose numbers increased from 5603 in 1920 to 45,208 in 1930. Although not essentially different from other Asiatics, Filipinos as American nationals are exempt from the exclusion laws. Their presence has occasioned agitation on the grounds of economic competition and a demand for their exclusion has been put forward. Under the terms of the Philippine independence bill passed by Congress in 1933, Filipinos upon the consummation of their political autonomy will in all probability become subject to the same immigration restrictions that apply to other orientals.

ORIGEN (c. 185-254), church father. Origen grew up in Alexandria, where he imbibed under the great Clement the doctrines of the Christian gospel, already philosophically interpreted, and under the neo-Platonist Ammonius Sakkas the philosophic doctrines of antiquity, already devitalized by the gnostics. In his thought Origen not only solved the problem of the union of these elements but also made possible the intimate fusion of Christian philosophy and dogmatics. His method involved, on the one hand, the maintenance of a sharp distinction between belief and knowledge and, on the other, the affirmation of their intimate psychological connection by virtue of their common source (in the Bible and the articles of faith) and on the basis of the hierarchy of the stages of knowledge. This hierarchy led from the lower spheres of history, authority and belief upward to the exalted spheres of perception and knowledge, of gnosis, in which—although not accessible to all and not explicable at all times or in entirety even to the chosen few—the complete truth lies enclosed.

Through this mystical unity of cosmic outlook Origen developed a doctrine of the origin and meaning of the world in every way akin to the ideas of the neo-Platonists. But he did more than this. Closer to reality than any of the late Greek philosophers, he managed to assimilate the spirit of his time, and by a method which now seems highly dangerous but yet was accepted as standard for centuries he reconstructed and interpreted allegorically all Biblical statements and facts which did not naturally fit into his system.

Although only a small part of his writings,

more than two thousand in number, have survived, Origen's position and influence may be readily reconstructed: he was the most independent philosopher, the most comprehensive theologian and the most learned humanist that early Christianity produced up to the time of Augustine. Of his extant works those important for the social sciences are the commentary on the *Epistle to the Romans* and especially the eight books against Celsus. Celsus, an eclectic Platonist whom Origen incorrectly supposed to be an Epicurean, had set up in the second half of the second century a *logos alethes*, or true doctrine, in opposition to Christianity. In a polemic which was so effective that for fifty years Christian apologists had been unable to destroy its influence, Celsus had sought to show that the few truths to be found in Christianity were all of pre-Christian origin, and had ridiculed the new religion as a superstition of the lower classes—of artisans and criminals. Origen in his refutation assumed a thesis precisely the opposite of that of Celsus. He was convinced that the sacred writings of Christianity must necessarily embrace all the wisdom of this world, and he thus incorporated the Greek conception of the state and Greek political science into Christian theology. Asserting that the Catholic church was not merely a religious institution but the heavenly and earthly city of God, he made it possible for Christianity to point to Plato and Socrates as its precursors and to fuse Plato's state with the Christian kingdom of God.

This utilization of Greek political science by Greek Christianity was also important in that it prepared the way for the adoption of late Roman jurisprudence. It is true that Origen, a theologian, did not go as far in the Greek sphere as did Tertullian, a jurist, in the Latin. But we find Origen already teaching a harmony between the law of God and the law of nature and no longer considering it impossible for the written law—the Roman law—to be in harmony with the law of God. Thus the path was opened for the incorporation of the Roman state into the Christian kingdom of God.

ORLOV, VASILY IVANOVICH (1848-85), Russian statistician. Orlov was the son of a village priest. After his graduation from Moscow University he took charge of the statistical division of the Moscow provincial zemstvo. The methods of statistical investigation which he eventually applied in Moscow and later helped to extend to twelve other provinces served to check an early tendency in zemstvo statistics toward a narrowly administrative point of view, and to transform it into the richest source of exact information on the rural economics of post-reform Russia. The significant features of his technique were: first, he used as the unit of investigation individual peasant households as grouped in land communes instead of starting with the latter as a unit or grouping households by soil areas, as was later done by the Chernigov zemstvo and others; secondly, he organized the gathering of facts in the field by special enumerators, who were later to tabulate them, instead of depending upon local government organs or the assistance of the local intelligentsia; thirdly, he made the investigation exhaustive, so that it covered all peasant households, and extended it to as large an area as the *uezd*, or administrative subdivision of the province. He was thus able to obtain trustworthy data on a wide range of questions and to enjoy the cooperation of the peasantry. This material was published in the *Sbornik statisticheskikh svedeny po moskovskoy gubernii* (Collection of statistical information for the Moscow province). The first nine volumes of this series, edited by Orlov, contain studies of peasant agriculture and other forms of landholding, peasant handicrafts and town industries, rural schools and rural insurance. Included also (vol. iv, pt. i) is Orlov's most important single work, *Formy krestnyanskogo zemlevladieniya v moskovskoy gubernii* (Forms of peasant land ownership in Moscow province, Moscow 1879), the first scientific study of the land commune in operation in 5500 villages, which sheds much light upon the fundamental but controversial question of periodic repartitions to equalize landholding. In addition to peasant censuses Orlov organized other branches of statistical work of the Moscow zemstvo, among them current statistics published annually from 1884. Orlov was active also in support of many practical reforms; here as in his statistical work he com-

bined, in a manner characteristic of the best zemstvo workers, scientific realism with unbounded devotion to the cause of the Russian peasant.

K. KOCHAROVSKY

ORNAMENT. The term ornament is usually applied in anthropological literature specifically to the adornment of the body. Such ornamentation appeared first in human history in the palaeolithic period, antedating pottery, agriculture and the domestication of animals; it is found among the most primitive peoples now living, as, for example, among the natives of the Andaman Islands and the Fuegians. Techniques of body ornamentation fall into three classes: permanent mutilations of the body, such as head deformation, constriction of the waist, binding of the feet, circumcision, filing of the teeth; the application of ornamental patterns directly to the body by scarification, tattooing and paint; and the attachment of ornamental objects to the body, including ornamental clothing and jewels. Necklaces are the most numerous of the last mentioned types of ornaments and are endlessly varied in material and form. Earrings, nose rings, lip plugs, bracelets, arm rings, anklets, leg rings and girdles are also widely distributed. In addition to ordinary clothing, which even when primarily practical follows well defined principles of design, there is the wealth of ceremonial clothing, headdresses, masks and miscellaneous ornaments, which is usually richer and even more fanciful.

In so far as ornament is connected with modesty or display its psychological basis is the same as that of dress. Westermarck contends that ornament and dress are primarily and almost solely a means of sexual attraction, basing his argument on the fact that decorations frequently call attention to the sex organs rather than conceal them and that in the individual life cycle body ornament reaches its maximum during the years immediately following puberty. On the other hand, Karsten, following Frazer, asserts that all body ornament and likewise all decorative art are based on magic, especially on the desire to ward off evil spirits. The influence of magic on ornament is evident in the widespread use of amulets and protective symbols and in the prevalent custom of inflicting bodily mutilations as part of mourning ceremonies; there seems to be little doubt, however, that in most places the chief function of ornament is display, either sexual or social. Westermarck's

theory is too narrow, for ornament is used to advertise more than an individual's sexual charms. It has been used variously to indicate tribal or totemic affiliation, rank, status, office, occupation or achievements. Australian natives scarify themselves to indicate their totem. Among many tribes boys on reaching puberty are given some distinguishing mark; they may, for example, be tattooed, or have their teeth knocked out or filed. Similarly, nubile girls are tattooed or wear distinguishing clothing or headdresses; Hopi girls from puberty until marriage dress their hair in two whorls representing squash blossoms, which are symbols of fecundity. Orthodox Jewish brides have their hair shaved and wear wigs and European and American women generally wear gold rings as marks of their married status. Among Polynesians tattooing was an index of rank; in Hawaii the use of feather cloaks was restricted to royalty. Designation of rank by personal ornament was most highly developed in mediaeval European heraldry; family connections, legitimacy and order of birth were indicated by the charges on a knight's shield, surcoat, banner and other trappings. An analogous system of heraldry developed among the Indians of the north Pacific coast, with the difference that heraldic devices were used most frequently on houses and household utensils. The Indians of the plains advertised membership and office in various men's societies by distinguishing headdresses, girdles and other insignia; the war bonnet related in specific detail the history of a brave's exploits.

Where trade has developed beyond simple barter ornaments are the most common media of exchange; the most conspicuous examples are the shell money of the North American Indians and the Melanesians, the cowrie shells of Africa and Oceania, the strings of dogs' teeth, the red feathers and the gold and silver disks that have spread over the world. Gold was used for ornaments in Europe before the days of money. In the islands of the *kula* ring of Melanesia the ceremonial exchange of strings of shell and carved arm rings provides the occasion for actual trade in commodities. When ornaments become capital the prestige that accrues from wearing them increases; in Iviza in the Balearic Islands, for example, a girl seeking a mate wears her whole dowry in gold coins about her neck.

In its purely aesthetic aspect body ornamentation differs in no way from other forms of decorative art; it exhibits the same dependence

on technical skill, the same principles of stylistic cohesion and variation as ceramics, sculpture or architecture. Boas contends that interest in form and delight in technical skill in the handling of materials have been determining factors in the development of decorative forms. On the other hand, Haddon and others, especially those interested in discovering universal evolutionary sequences, maintain that designs arise from the desire to reproduce phenomena and that abstract ornament results from the inability or disinclination to reproduce accurately. Haddon pays respect to the role of handicraft in the development of design, but he stresses abstraction as a universal process in the development of decorative concepts. All universal sequences are, however, purely speculative and are misleading; the abstract and the representative are two distinct tendencies in decoration which appear at about the same time in human history. In a number of cases, where historical reconstruction is possible on the basis of available evidence, development has been traced from abstract to representative forms. The hypothesis that all ornament is inadequate representation has recently been given new impetus by certain psychoanalysts, who see in art a channel of sublimation of the unconscious by means of elaborate symbols. Unquestionably different types of symbolic interpretations attach themselves to decorative forms, but the assumption that ornament is always symbolic or originally symbolic is unfounded.

The present tendency is to study each characteristic ornament in relation to its material, its technique and its cultural and historical setting. All ornament is rooted in the material from which it is created. Ornament developed in weaving must necessarily differ in fundamental character from that developed in clay or stone; and when patterns are transferred from one technique to another, the new form bears only the most superficial resemblance to the old. Skill in the chosen medium is the primary requirement in producing works of art. Virtuosity produces a perfection of form and regularity of surface texture that are decorative without recourse to added ornament. Rhythm, which is the repetition of similar units, and symmetry, which is the balanced arrangement of elements within the unit, are the two complementary principles that underlie all ornamental design and are handled in accordance with culturally determined standards of beauty.

Recent studies of ornament have concerned

themselves largely with phenomena of style. Artistic expression becomes stylized in characteristic forms differing widely from each other in content, arrangement and fundamental concepts; this is so marked that one is rarely in doubt in assigning a given ornament to a certain group at a certain period on the basis of these features alone. These conventional modes of expression are as characteristic of groups as are their property institutions or their methods of designating kin. Given the established conventions of his group, the artist must steer his precarious course between unimaginative repetition and mannered overstylization.

Art styles differ dynamically as well as descriptively. Some are stable and tend toward stereotypes; others toward exuberance and rapid disintegration. Some styles foster, others inhibit, individual inventiveness. Monotony may be the result either of dull craftsmen or of a stultifying tradition. Tradition is not in itself paralyzing; modern Hopi potters, for example, revolting against the deadening monotony of their recent style of ornament, turned for inspiration to their own remote past and revived an ancient style, highly characteristic and compact, yet offering scope for imaginative variation, and in this style achieved a refreshing vitality of design. Ornament, being tangible and easily observed, has provided one of the most instructive laboratories in which to study the ways in which individuals operate within tribal patterns.

ORTES, GIAMMARIA (1713-90), Italian economist and social theorist. Ortes is probably the only one of the group of eighteenth century Venetian economists comparable in importance to the contemporary economists of Naples and Milan—Genovesi, Galiani, Filangieri, Pietro Verri and Beccaria. Although known best as an economist and population theorist, he ranged widely in his work and interests. Besides covering the entire gamut of what would now be called the social sciences, he was philosopher, mathematician, physician and poet. His taste for abstract and historical studies was developed in the monastery, where he remained from boyhood until the age of thirty. Securing release from his vows he led for the most part a retired and studious life, punctuated by scholarly polemics and by visits to Vienna, Berlin, Florence and probably to London. Despite his withdrawal from the monastery he remained a staunch defender of the outlook and the position of the clergy. This was part of a certain feudal and antiliberal strain in his work which may be said to have reflected the influence of the economically stagnant Venetian state. To this strain belong his defense of mortmain and of mediæval restrictions on the right of property and his opposition to interest and the creation of a money economy. But there was also a decided liberal and even strangely socialistic strain in him, which went so far that some of his writings were banned in Tuscany, Venice and the Papal States. His conception of economics as *economia nazionale*—a term which he took over from the German *Nationalökonomie*—placed the emphasis on the factors affecting the welfare of the entire state rather than on the prince or ruling

group. He pointed out the importance of labor and of occupational divisions. But above all his emphasis fell upon the maldistribution of wealth as the root of the economic problem. It is principally from this point of view that Loria has spoken of the "modernity" of his thought.

Ortes' economic views are always abstract and frequently formulated in the mathematical terms which seemed to him the core of scientific method. He was often narrow in his premises and inflexible in his deductions. His central premise was that population increases or decreases with the fluctuations in the volume of "capital" (i.e. consumable goods). From this constant ratio between capital and population it follows that the average income is always and everywhere constant, and hence since poverty exists it must be caused by the unequal distribution of wealth. Ortes therefore rejected most of the current liberal solutions of the economic problem which stopped short of dealing with the fundamentals of population and unequal distribution. He opposed protectionism, despite the possibility that it might increase a state's capital, on the ground that it only aggravated pecuniary accumulation and therefore poverty.

In following out his analysis of the population-capital ratio Ortes anticipated Malthus' position. He calculated that in the absence of checks population could double every thirty years, but that subsistence could not be increased in the same ratio. On a given territory therefore with a given income distribution population grows up to the limits of subsistence. The poor are often kept from marriage for want of adequate subsistence, while the wealthy often avoid it for fear of subdividing their wealth. But given the existing wealth distribution, Ortes favored the limitation of marriage and defended celibacy as a way of averting undue poverty and misery. Given a certain fixed capital in a country, population could increase in proportion as the inequalities of distribution were ironed out. To encourage marriage under other conditions, however, would be to increase misery. Another of Ortes' conceptions which sounds strangely modern is that of a permanent non-reducible "industrial reserve" army: in any country the demand for labor is adequate to provide employment for only half the population, which must therefore support the unemployed half. This situation exists even in Ortes' ideal state, which covered an area of five thousand square miles and contained a million inhabitants and in which the division of labor and the ease

of obtaining subsistence were at a practical maximum.

JOSEPH J. SPENGLER

Important works: Ortes' most important writings were the *Economia nazionale* (Naples 1774, 2nd ed. 1778), the *Dei fidecommissi a famiglie, e a chiese e luoghi pii* (Venice 1784), and the *Riflessioni sulla popolazione delle nazioni per rapporto all' economia nazionale* (Venice 1790). These are reprinted with his other works in *Scrittori classici italiani di economia politica*, ed. by Pietro Custodi, 50 vols. (Milan 1803-16) vols. xxviii-xxxiv.

Consult: Faure, André, *Giammaria Ortes, économiste vénitien 1713-1790* (Bordeaux 1916); Lampertico, F., *Giammaria Ortes e la scienza economica al suo tempo* (Venice 1865); Loria, A., "Della modernità di Giammaria Ortes" in *Reale Istituto Veneto di Scienze, Lettere ed Arti, Atti*, vol. lx (1900-01) pt. ii, p. 961-76; Franchis, C. de, *Giammaria Ortes, un sistema d'economia matematica nel '700*, *Politica, Economia, Corporativismo*, vol. iii (Naples 1930); Gonnard, R., "Un précurseur de Malthus, Giammaria Ortes" in *Revue d'économie politique*, vol. xviii (1904) 638-66; Uggé, A., "La teoria della popolazione di Giammaria Ortes" in *Giornale degli economisti e rivista di statistica*, vol. lxxviii (1928) 35-74.

ORZECKI, ROMAN. *See* ORZHENTSKY, ROMAN MIKHAYLOVICH.

ORZHENTSKY, ROMAN MIKHAYLOVICH (Orzecki, Roman) (1863-1923), Russian statistician and economist. Orzhentsky was the son of a Pole in the Russian government service. He taught statistics at Odessa University and from 1906 to 1918 was professor at the Demidov Law School, serving at the same time as chief of statistics of the provincial zemstvo at Yaroslavl. At his death he was professor of statistics at Warsaw.

Orzhentsky was interested mainly in the philosophical and methodological aspects of economics and statistics. In economics he confined himself almost entirely to the theory of value, a subject on which he published several historico-critical monographs. His constructive contribution, as it appears in "Ponyatie ob ekonomicheskoy yavlenii" (The concept of the economic phenomenon, in *Zapiski imperatorskago novorossiyskago universiteta*, vol. xciii, 1903, pt. ii, p. 1-384), displays clearly the influence of the Meinong-Ehrenfels school and of Alfred Marshall; it leads up to a characterization of economic value as a practical value capable of exact measurement in money. In statistics too his important work is a theoretical treatise, *Svodnie priznaki* (Collective properties, *Vremennik demidovskago uridicheskago litseya*, vol. ciui,

Yaroslavl 1910). Orzhentsky defined statistics as a method of establishing and testing the properties of collectives by comparing them with the properties of individual members; he maintained that statistical inference is merely a way of generalizing from a sample to the universe and therefore in dealing with collectives it precedes logically but does not replace ordinary induction. Admitting that the concept of probability is applicable also to a situation where the operating forces are not causally determined, he refused to regard this possibility as sufficient to reconcile the presence of regularities in human behavior with alleged freedom of will. He believed, on the contrary, that volitional acts are subject to causal laws, that their regularity reflects the fundamental physical and hence psychic uniformity of man and that their variability, which makes psychic evolution possible, is traceable to the influence of many independent environmental factors, including individual differences. One of the pioneers of mathematical statistics in Russia, Orzhentsky was for some time virtually the only Russian exponent and advocate of Pearsonian methods as distinguished from the German-Scandinavian approach; in his zemstvo work he applied them to such practical problems as the reliability of crop reports from various local sources, the influence of seeding and fertilizing upon yield and the determination of factors affecting the value of urban real estate.

SOLOMON KUZNETS

Consult: Fryde, M., in *Ekonomista*, vol. xxiii (1923) no. iii, 1-7; Kaufman, A. A., *Statisticheskaya nauka v Rossii* (Statistical science in Russia) (Moscow 1922) p. 64, 96-99, 139-45.

OSBORNE, THOMAS MOTT (1859-1926), American civic leader and prison reformer. Osborne's father was a prosperous manufacturer in Auburn, New York; his mother was an ardent leader in the women's rights movement. After his graduation from Harvard College, Osborne became associated with his father's enterprises in Auburn. He founded and published the *Auburn Citizen*, which soon became the leading newspaper in that section of the state, became principal owner of the local bank, was for many years an active member of the board of education and served for two consecutive terms as mayor of his city. In the meantime his political influence had extended widely through the upper counties of the state. Playing an independent role, Osborne found himself increas-

ingly at odds with the dominant faction of the Democratic party. Eventually the bitter personal animosity he thus aroused had much to do with the disruption of the chief work of his life.

Always a humanitarian, Osborne's passion for prison reform did not awaken until his appointment to the New York State Commission on Prison Reform in 1913, when he was well over fifty years of age. He managed to spend a week in Auburn Prison as a voluntary inmate and his intimate association with his fellow prisoners during that ordeal inspired him to attempt the reform of the prison system. His conception of penology was simple. The prisoner is much like other men, but spoiled and distorted by the conditions of prison life. Punishment of the offender is a social necessity as a deterrent influence both on the offender and on the community at large. While the punishment should usually be commitment to prison, the prison itself should not be a place of punishment but of education, especially of education in self-government. This was the basic principle of the "Mutual Welfare League," composed of all the inmates of the prison, choosing its own officers and administering its own discipline. It was tried out experimentally at Auburn under Osborne's guidance, and for several years it was a definite policy in Sing Sing Prison, after Osborne's appointment as warden of that institution in 1914.

The "new system," which with few exceptions won the ardent support and cooperation of the prison inmates, excited the fears and the hostility of politicians, of the governor of the state, the judges of the criminal courts, prosecuting officers and prison officials generally. In 1915 charges of misconduct in office were pressed before the local grand jury and Osborne was formally indicted and held for trial. The charges were ultimately dismissed, and Osborne was reinstated in office, but his administration was so hampered by the authorities in Albany that after a few months he felt compelled to resign.

In August, 1917, Osborne was appointed commandant of the United States naval prison at Portsmouth, New Hampshire, where he again instituted his system of inmate self-government, which continued until his voluntary retirement in March, 1920. Thenceforth he devoted himself for the most part to the organization and direction of private agencies for the promotion of the reforms for which he had labored. He was an eloquent and forceful speaker and during his last years made many speaking tours in England

as well as in the United States. His books—*Within Prison Walls* (New York 1914), *Society and Prisons* (New Haven 1916) and *Prisons and Common Sense* (Philadelphia 1924)—have been widely read, and his views have had considerable influence in some European countries, but have left no enduring mark on the American prison system.

GEORGE W. KIRCHWEY

Consult: Tannenbaum, Frank, in *Survey*, vol. lxx (1930-31) 7-11, 52-55, 156-58, 182-83, 189-92, 266-70, 301-04, 378-81, 399-401, 614-16, 623-25; Wines, Frederick Howard, *Punishment and Reformation. A Study of the Penitentiary System* (new ed. by Winthrop D. Lane, New York 1923) p. 393-406; Liepman, Clara Maria, *Die Selbstverwaltung der Gefangenen*, Hamburgische Schriften zur gesamten Strafrechtswissenschaft, vol. xii (Mannheim 1928).

OSGOOD, HERBERT LEVI (1855-1918), American historian. Osgood was born in Canton, Maine, of New England stock and was educated at Amherst, Yale and Berlin. Called to Columbia University in 1890 to become an assistant of John W. Burgess, he was made a full professor six years later and thenceforth devoted himself chiefly to graduate instruction. Although he possessed a wide range of intellectual interests and in his teaching dealt with many fields of historical knowledge, he centered his attention almost entirely upon the history of the British colonies in continental America, treating them from the points of view of government, administration and public law. He drew about him in his more than twenty-five years of teaching groups of young men, many of whom not only made important contributions to the subject but also became distinguished scholars in later years. His own great work, *The American Colonies in the Seventeenth Century* (3 vols., New York 1904-07) and *The American Colonies in the Eighteenth Century* (published posthumously, 4 vols., New York 1924-25), is an outstanding feature of American historiography. Its merits are profundity, accuracy, power of interpretation and freedom from nationalistic bias; its limitations are the narrowness of the field treated, the incompleteness with which the British side of the story is dealt with and the omission of the social, economic and commercial aspects of the subject. But slight attention, for example, is given to the significance of rising prices, debt and the cost of living, the growth of regional and radical feeling and the bearing of commerce and the increase of wealth on legislation. Within the limits which the author set for himself these

voïumes at their best are of rare excellence, at their worst a great reservoir of knowledge remarkable for the thoroughness with which the material is digested and the skill with which the intricate and scattered details are brought together and wrought into a readable whole.

OSSE, MELCHIOR VON (c. 1506-c. 1557), German jurist and early cameralist. Osse received the degree of doctor of jurisprudence at the University of Leipsic in 1534 and was appointed professor of law at the same institution. Throughout his life he remained adviser to the Saxon princes and frequently served as their ambassador to the Reichstag.

Osse was the first German writer on public law to attain great influence. Of noble birth, he was highly conservative and based his views on the teachings of Aristotle and his legal opinions on the precepts of Roman law as interpreted by the scholastic postglossators of the thirteenth and fifteenth centuries. He was no champion of Lutheran beliefs and his supreme goal was the reunion of the Protestant and Catholic churches; by the Lutherans he was looked upon as a secret papist. Although his political philosophy was still dominated by the idea of the divine right of kings, he was among the first in his time to place the welfare of the people on a par with that of the ruler. In his economic views, as set forth in the *Politisches Testament*, prepared for the elector August in 1556, Osse followed the writers of the so-called juristic tax literature, but with him mercantilist views already make their appearance. He proposed the organization of a royal revenue office and believed that the prince should derive his revenue from the domains, resorting to taxation only in an emergency; he held, however, that the taxes must not burden the subjects too heavily. He believed in good money as conducive to good business, condemned luxury as a factor in draining the country of coin and advocated price regulation of foodstuffs.

Bargum as *Die Entstehung der deutschen Kameralwissenschaft im 17. Jahrhundert* (Jena 1911).

OSTRACISM was an Athenian political institution designed to rid the community temporarily of persons who appeared to menace its welfare by their very prestige and influence. It dates from the period of the civil war between the Pisastratids and the democratic faction. An opportunistic measure, it was initiated by Clisthenes, who hoped thereby to eliminate from practical politics the adherents of the Pisastratids and thus to disorganize their party and prevent a return to tyranny. It differed essentially from the Greek *atimia*, a much more stringent punishment which consisted of the banishment and complete outlawry of the individual and frequently of his entire gens; ostracism affected only the individual and touched neither his property nor his civil status. For a ten-year period the person against whom the decree was directed was denied political rights and was compelled, under penalty of *atimia*, to live a prescribed distance from Athens; this deprivation was severe enough for the cultivated Athenian, closely bound to the city and its politics.

Only a single individual could be ostracized each year. There were two steps in the process. First, there appeared annually on the regular agenda of the Ecclesia during the sixth prytany the question whether a special plenary assembly should be held for the purpose of ostracizing. If the decision was in the negative the problem was disposed of for that year; but if it was affirmative the second step was the voting in the assembly summoned to decide upon whom the blow should fall. The peasants, who were not usually active in politics, flocked into the city to vote; this was an opportunity for the Athenian citizenry to express itself on the policy of the prevailing administration and thus to control it. Each wrote on a potsherd, *ostrakon*, the name of the person he wished to have ostracized. The ostracism was not valid unless at least six thousand votes were cast; the person who received the plurality was ordered to leave Athens within ten days. Some historians hold that six thousand votes had to be cast against the ostracized indi-

vidual; and it may well be that in actuality the six thousand or more ballots cast usually bore but one name, for it would have been in the interest of the minority party to abstain from voting in order to prevent the quorum of six thousand. The ostracized person had to collect debts owing him and settle with his creditors before leaving Athens—possibly so that opposition to or support of the victim would not be colored by private considerations.

Although ostracism became a law in 508 B.C., it was not until 487 B.C., after the victory at Marathon, that the democracy was strong enough to invoke it. Hipparchus was the first to be ostracized. The next to go was Megacles in 486 B.C., and in 485 B.C. another aristocrat was selected; all three were outstanding supporters of the Pisistratids. As the democracy became more firmly entrenched, however, ostracism was employed less often; intervals of ten and sometimes of more than twenty years elapsed between such banishments, and probably in all Athenian history only ten persons were ostracized.

When an ostracizing assembly was about to convene, the issue was rarely whether one person or another person should be ostracized. Usually only one name, that of the leader of the minority group, was whispered in the market place, and the question was whether or not the ruling party would be successful in freeing the city of his presence. But in 442 B.C. there was a great political battle between Pericles and Thucydides, around whom the conservatives had rallied, which finally resulted in the ostracism of Thucydides. Twenty-five years later the struggle between Alcibiades and Nicias, which was wrecking the peace of the state, culminated in a desperate coalition between the two men, and in the vote of ostracism a figure of minor importance, Hyperbolus, was made the scapegoat of the rivals, one of whom had been expected to take the road from Athens. It is clear from this incident that although in this period the danger of individual tyranny had ceased to exist, ostracism was being employed for party ends. It had outlived its usefulness and from this time on fell into disrepute. No person was ostracized thereafter, but for many years the question continued to be put to the Ecclesia annually. After the Persian War and the growth of Athenian influence ostracism had been adopted by several other democratic states—Argos, Miletus and Megara—and by Syracuse, where it was known as *petalism* from the leaves upon which the names of the candidates were written.

Ostracism involved no disgrace; it neither accused nor condemned on grounds of wrongdoing; nor did it signify for its victims perpetual retirement from public activity. All the men who suffered ostracism were outstanding Athenians and upon their return regained their positions in the life of the polity. For example, Aristides, who returned to Athens after the general amnesty of 480 B.C., was immediately appointed commander of the hoplites.

Ostracism was essentially an interference with the individual in the interest of the state. In accordance with Greek political philosophy the individual must be willing to submit to this sacrifice. Since ostracism required the support of a large part of the citizenry, there was less chance that it would provoke a civil war than in the case of the wholesale banishment of their enemies by the tyrants. In fact it hindered just such factional struggles and gave the dominant party an opportunity to carry out its program. Since some hope of regaining his place in Athenian society was left to the ostracized person, he was less likely to attempt a coup d'état or to ally himself with an outside state, as did so many of the perpetual exiles.

The Athenians, realizing that ostracism was a serious denial of individual rights, surrounded it, like all laws affecting an individual, with numerous safeguards. No one could take the initiative in suggesting a vote on ostracism; it was a routine matter which could arise only once a year at a particular time and not whenever political passions demanded. It is doubtful whether any discussion was allowed. There was a fixed interval of time between the decision to take a vote and the meeting of the special assembly; and although in reality it permitted party activity and the organization of voters, it was probably intended to serve as a period for calm reflection. The vote moreover had to be secret and to be held in a plenary meeting of the citizens. The victim might by certain formalities be recalled if opinion changed in his favor, as happened in the case of Cimon. All these provisions and the fact that the temporary exile retained his civil and property rights were an acknowledgment that ostracism was a political expedient, an injustice to and not a judgment upon the individual.

OSTROGORSKY, MOISEY YAKOVLEVICH (1854-1919), Russian political theorist. The mordant but hopeful historian of the pathology of party organization in England and the United States in the nineteenth century was born in the province of Grodno in Russia. Prepared in a local gymnasium, he studied under the juridical faculty of St. Petersburg and for a time was attached to the Ministry of Justice in an editorial capacity. His further training was gained in France, notably under Émil Boutmy at the École Libre des Sciences Politiques, where he finished in 1885. His vocational activities mingled teaching and writing; his minor works included histories of Russia used in its schools. Articles from his pen before 1890 dealing with party organization in the new world indicated how early he focused the interest which, exhaustively pursued through documentary sources and by first hand observation, culminated in 1902 in the publication of the two-volume treatise *La démocratie et l'organisation des partis politiques*, almost immediately translated into English. Meanwhile his democratic outlook had been signalized by *La femme au point de vue du droit public*, successfully submitted in 1892 in a prize competition arranged by the Paris Faculté de Droit. In 1906, after his return to Russia from residence in England, his election to the First Duma gave brief scope for the application of his liberal leanings. As a Constitutional Democrat he was sufficiently active to be a member of its committee of nineteen, for which he was reporter on eight propositions. With the dissolution of the Duma his participation in practical politics ended. His continued interest in old themes was evidenced by articles in Russian journals in 1913 on the constitutional evolution of England.

It is on his study of party organization in relation to the democratic principle that Ostrogorsky's reputation must rest. From the

standpoint of approach and emphasis in the study of political institutions he was significant as a pioneer in the shift of attention from legal forms to their practical modification by extra-legal processes. In essential thought, however, he was so far from innovation that his work, full of valuable historical details, is in itself historically interesting as an illustration of the reaction of old ideals to the conditions of the *fin de siècle*. Unlike those of his contemporaries in the realistic reorientation of political science who soon proceeded to interpret party abuses as self-corrective adjustments in a defective governmental organism, Ostrogorsky viewed institutional politics as wholly pathological. Despite the apparent sophistication involved in his method of observation, reenforced by some pungency of humor and a racing though repetitious style, the core of his thinking was a vast naïveté, which indeed was the ardent spirit of the man himself. He believed in spiritually emancipated individuals, who, in keeping with the principle of "union without unity" which democracy implied and which it was destined finally to realize, would act politically through flexible and impermanent associations. This end, Ostrogorsky urged, could be facilitated by the establishment of non-partisan electoral methods, in which a concert of attention without party regimentation could be accomplished through double elections or preferential voting. He visited the United States at the beginning of the period of legal regulation of parties in the name of control by the rank and file; he revisited it—after the frustration of his active political career made it possible for him to undertake an abridgment and revision of the second volume of his main work—when the movement was in full stride. In his view all the legislative tendencies from the time of the introduction of the Australian ballot, especially the direct primary, involved fatal concessions to regimentation in that they officially recognized parties. In other respects the drift of the time seemed with him. Party ties were weakening. Even in England socialism had not gone far enough to crystallize a new division of interests and loyalties. Ostrogorsky's slogan, "Down with party, up with league," was in large degree realized in a period of flaccid politics and active, piecemeal reform. Fundamentally, however, the limitations of his faith caused him to miss the trend of events. His grasp was wide; he consciously emulated Montesquieu in seeking to synthesize interacting factors; but as a liberal

he slighted economic interests. Even in proposing to "organize the moral authority of social intimidation" (II, 754) he assumed the existence of atomic citizens at once omniscient and disinterested.

ARTHUR W. MACMAHON

Important works: *La femme au point de vue du droit public—étude d'histoire et de législation comparée* (Paris 1892), tr. as *The Rights of Women* (London 1893); "The Rise and Fall of the Nominating Caucus, Legislative and Congressional" in *American Historical Review*, vol. v (1899-1900) 253-83; *La démocratie et l'organisation des partis politiques*, 2 vols. (Paris 1902), tr. by F. Clarke as *Democracy and the Organization of Political Parties* (New York 1902); *Democracy and the Party System in the United States* (New York 1910).

OTTO I (912-73), king of the Germans from 936. Continuing the work of Henry I, Otto curbed the power of the hereditary dukes, defeated the Hungarians, established his suzerainty over the Slavic east, intervened successfully in France and Burgundy, conquered Italy and in 962 acquired the imperial crown; thus he attained a position of hegemony in Europe and restored, although on a modified basis, the virtually disintegrated empire of Charlemagne. From the point of view of institutional development he is important as the creator of the so-called Ottonian administrative system. This consisted essentially in the employment of non-hereditary imperial officials, such as bishops and abbots, and was designed to halt the centrifugal tendencies which had attended the development of public offices into hereditary titles monopolized by the feudal lords. In return for financial and military assistance Otto gave to his new officialdom not only land but also judicial jurisdiction and the royal rights to markets, tolls and coinage. Until its disruption during the investiture conflict the system thus created provided a solidly organized and entirely reliable mechanism for imperial administration and continued to perform valuable services well into the thirteenth century.

It was partly the strength of the Carolingian tradition but partly also an international perspective traceable to the dual allegiance of these prelates, who were ecclesiastics subject to Rome as well as royal officials and landowners intimately associated in national affairs, that inspired Otto to renew the empire and establish his authority over the pope. When Pope John XII summoned him to combat the Italian king Berengar II, Otto in his capacity as emperor confirmed the rights of the papacy to the terri-

ories granted by the Carolingians. While in Rome, however, he laid claim to the exercise of supreme judicial functions and established the imperial right to exact an oath of fidelity from the pope before the latter's consecration. After the deposition of the vicious and hostile John, Otto made the Romans promise on oath that henceforth the wishes of the emperor would determine even the nomination of candidates for the pontificate. Otto thus incorporated the papacy into the imperial church, creating a relationship which lasted, with slight modifications, almost a century before the papacy succeeded in breaking the yoke. Regarded from a German national point of view, Otto's political program undoubtedly contained the germs of future trouble. But such a judgment would proceed from assumptions quite different from those of an age preoccupied as was Otto's with the ideals of Christian universalism.

KARL HAMPE

Consult: Köpke, R. A., and Dümmler, F. L., *Kaiser Otto der Grosse* (Leipzig 1876); Hampe, K., in *Meister der Politik*, ed. by E. Marcks and K. A. Müller, 3 vols. (2nd ed. Stuttgart 1923-24) vol. i, p. 279-322, and *Herrschergealten des deutschen Mittelalters* (Leipzig 1927) ch. iii; Steinen, W. von den, *Otto der Grosse* (Breslau 1928); Poole, A. L., "Italy in the Tenth Century," and "Henry I and Otto the Great" in *Cambridge Medieval History*, vol. iii (Cambridge, Eng. 1922) chs. vii-viii.

OTTO OF FREISING (c. 1114-58), mediaeval historian and churchman. Otto studied philosophy and theology at Paris and became a Cistercian monk. He was made abbot of the monastery of Morimond in Burgundy and was later elected bishop of Freising. His two historical works are among the most valuable original sources of information available concerning the last half of the eleventh and the first half of the twelfth century and have earned for him the renown of "the best historian of the Middle Ages." His *De duabus civitatibus* (in *Monumenta Germaniae historica*, Scriptores, vol. xx, Hanover 1868, p. 83-301; tr. by C. C. Mierow, New York 1928) is a general history from the creation of the world down to his own time. It has little in common with the new literature, written in the vernacular tongues, that was beginning to spring up at that time in western Europe. Otto's eyes were turned to the past, and in his book he is forever referring to the vanity of the world. This was due in part to the influence of Augustine's philosophy of history. Like Augustine he was always conscious of the conflict between the City of God and the

City of Satan. Not satisfied with a mere chronological record of events, as were all preceding mediaeval chroniclers, he sought for cause and effect; and this, he believed, he had found in the struggle on earth between the forces of good and evil, between the children of light and those of darkness, between the City of God and the City of Satan. But the history of the time is not lost sight of in the idea of these two clashing states. There is a good deal of information about the important persons and events of the author's lifetime. Otto's narrative comes down to 1146, and from that date it was continued to 1209 by another monk who lived in the monastery of St. Blaise in the Black Forest. This work was very popular in the last century and a half of the mediaeval period and was frequently quoted by writers throughout the three centuries of the Renaissance. Otto's second historical work, the *Gesta Friderici 1 Imperatoris* (in *Monumenta Germaniae historica*, Scriptores, vol. xx, Hanover 1868, p. 338-496; tr. into German by H. Kohl, Leipsic 1883-86), was written at the request of Frederick Barbarossa. It is arranged in four books, the last two of which were written by Otto's assistant Rahewin, and deals with the century following the outbreak of the quarrel between the papacy and the empire over the question of investiture.

OTTO-PETERS, LOUISE (1819-95), German feminist. Louise Otto, the daughter of a family of lawyers and doctors, received an excellent education. In her early romantic poems she advocates democracy and humanity; one of the first of her novels, *Schloss und Fabrik*, deals with workers' life and almost all of them advocate religious, ethical and social freedom. Her prose works show the influence of George Sand's socialistic ideas. She was a close friend of Robert Blum, a martyr of the *vormärzliche* days, and her poem on his death was reprinted throughout the German press.

In 1858 she married August Peters on his completion of a seven years' term at hard labor, and until his death in 1864 they edited together the democratic *Mitteldeutsche Volkszeitung* in Leipsic. In 1865 with Auguste Schmidt and

others she founded the Allgemeiner Deutscher Frauenverein and became the first president of this organization, which for two generations promoted women's education and progress. Convinced that the women's question was primarily ethical and that it was essential to raise the mental level of women, she advocated their right to earn money as a step toward independence and guided the drawing of petitions to the Reichstag for their admission to medical and other professional studies. She founded the *Neue Bahnen*, organ of the Frauenverein, which in 1894 joined with all other German women organizations, except those of a purely charitable or socialistic nature, in the Bund Deutscher Frauenvereine.

MARGARETE DRIESCH

Important works: Novels: *Ludwig der Kellner*, 2 vols. (Leipsic 1843); *Schloss und Fabrik*, 3 vols. (Leipsic 1846); *Römisch und Deutsch*, 4 vols. (Leipsic 1847); *Nürnberg*, 3 vols. (Prague 1859, 2nd ed. Bremen 1875); *Neue Bühnen*, 2 vols. (Prague 1864); *Die Nachtigall von Werawag*, 4 vols. (Freiburg i. Br. 1887). Essays: *Privatgeschichten der Weltgeschichte*, 6 vols. (Leipsic 1868-72); *Das Recht der Frauen auf Erwerb* (Hamburg 1866); *Das erste Vierteljahrhundert des Allgemeinen Deutschen Frauenvereins* (Leipsic 1890). Poems: *Lieder eines deutschen Mädchens* (Leipsic 1847); *Westwärts* (Meissen 1849); *Mein Lebensgang* (Leipsic 1893).

Consult: Schmidt, Auguste, and Rösch, Hugo, *Louise Otto-Peters* (Leipsic 1898); Plochow, Anna, *Die Begründerinnen der deutschen Frauenbewegung* (Leipsic 1907).

OUTLAWRY is the withdrawal by civil society of all legal rights and protection from one of its offending members. The device of thrusting out of the group those who have broken its code is very ancient and constitutes the most fearful fate which primitive law could inflict. The offender was cut off from the ancestral cult and so deprived of divine protection. His house was demolished and his goods were destroyed or confiscated, and he was driven forth naked into the wild. If he were slain no price could be demanded and no feud could avenge him, and thus his life was at the mercy of anyone who came upon him. In ancient Greece as well as in mediaeval Europe he was likened to a wolf. If his offense was religious his outlawry was essentially an act of self-defense by the community, which thus sought to escape divine vengeance by expelling the offender from its midst and devoting him to the wrath of the gods.

In more advanced societies it becomes necessary to distinguish outlawry from several similar

but less serious penalties, such as exile, which was generally a voluntary withdrawal not resulting directly in loss of property or civil rights; banishment, which was similar save that it was compulsory; and ostracism, which was a peculiar Greek procedure for the expulsion of persons whose presence was politically undesirable. The Catholic church employed excommunication and the interdict and soon developed a systematic body of law on the subject, which was closely analogous to that of outlawry, with which it was constantly compared by contemporary lawyers.

In the Middle Ages outlawry was a punishment particularly applicable at first to those who refused to pay the money composition due for their misdeeds and later, with the growth of monarchical power, to those who refused obedience to the solemn command or ban of their lord. This procedure was available in Germany in criminal and later in civil proceedings, both to compel appearance before the court and to enforce compliance with the judgment. Outlawry was used extensively as a weapon to enforce the payment of a debt upon which the debtor had defaulted. If the latter failed to answer the summons issued at the behest of the creditor or to fulfil the judgment, he was declared an outlaw and his goods could be seized. Gradually the law was modified, the king ordering the seizure of the debtor's goods, which were confiscated if the debtor did not pay his obligation within a year and a day. From these goods payment was then made to the creditor. At the close of the Middle Ages the imperial ban assumed political importance, until it fell into disuse early in the eighteenth century, outlawry on civil process having already been abolished in 1654.

In France outlawry became more and more procedural. Judgment by default being impossible, outlawry was regarded by the earlier French writers as the punishment of the contumacy rather than of the principal charge. This view was not held consistently during the thirteenth century and it was sometimes stated that the outlaw was in fact thereby convicted, with the result that if he surrendered he could not be tried on the principal charge. To escape this difficulty a compromise was effected between the two doctrines and the outlaw was allowed to "prove his good faith" and stand his trial. The ordinance of 1670 on criminal procedure contained provisions for condemnation in absence, however; and this, combined with the

development of a more effective system of law enforcement and, in recent times, of extradition treaties between the principal nations, has rendered outlawry unnecessary at the present day. Nevertheless, in France the institution of civil death, a modified form of outlawry, was used during the revolution against the émigrés and later was recognized in the *Code civil*. The person adjudged civilly dead was regarded as having no existence in law: he could not dispose of his property or enter into contracts. This institution was adopted in those parts of Germany where French law exerted a predominant influence. France abolished it in 1854. Prussia had done away with this process even earlier and the other German states soon followed its example.

Generally speaking, the weaker the system of law enforcement, the more readily it resorts to outlawry, as is shown by its use in the early Scandinavian laws for comparatively minor matters, both as a direct punishment and for disobedience to court orders. In Anglo-Saxon law outlawry was reserved for the most serious of crimes. The outlaw lost all civil rights and was regarded as bearing "a wolf's head"; he was to be slain at sight and his property was forfeit. To give him aid or shelter was itself a crime. With the growth of criminal law, however, the outlaw's fate might sometimes be modified. The king might, if he saw fit, insist upon only some instead of all the incidents of outlawry; and thus a series of punishments—death, mutilation, imprisonment, forfeiture and fine—might be exacted instead of the complete penalty, at the choice of the crown. As a result outlawry became primarily a means of compelling fugitive criminals to surrender. In the more settled practise of the Norman age outlawry was incurred when the accused failed to appear in answer to an "appeal" or criminal accusation, triable by battle, brought by the injured party or his representative. If the proceedings were by indictment, however, the accused was not outlawed until an inquest, taken in his absence, had certified the crown of his guilt. In either case he had about five months in which to surrender before outlawry was finally pronounced.

If the outlaw was captured and the outlawry proved before a judge, the death sentence followed immediately. As late as 1353 it was held that one outlawed for felony could be slain with impunity, although a century earlier Bracton had argued for the view that he could be slain only if he resisted capture. In cases of treason and felony outlawry came to be regarded as

equivalent to a conviction, thus affording a new reason for the old incidents of loss of life and chattels, corruption of blood and escheat of lands to the lord after the crown's right to year, day and waste. Statistics compiled by Maitland from thirteenth century English rolls show that for every felon hanged there were ten outlawed; it is therefore not surprising that the outlaw and the bandit are picturesque figures in popular tales.

A slightly reduced form of outlawry was applied to those felons who succeeded in taking sanctuary. They were allowed to confess to the coroner and to depart overseas; but their goods were forfeited, their lands escheated and, if ever they returned, the one remaining incident of outlawry, loss of life, was exacted. A much milder form of abjuration, allowing the offender to leave the jurisdiction, was inflicted by some English boroughs and palatinates as a punishment for less grave offenses, especially those by young persons. A somewhat similar form of local banishment (*interdiction de séjour*) was set up in France in 1855 and is frequently inflicted upon habitual criminals. The outlawry of women is technically known as waiver.

A curious phenomenon is the spread of outlawry from criminal to civil procedure. In the middle of the thirteenth century the process to compel appearance in personal actions, where moreover judgment could not be given on default, was long and slow and frequently ineffective. To remedy this outlawry began to be used in a final effort to bring in the defendant. This naturally appeared earliest (c. 1250) in actions of trespass where force and arms were alleged. Subsequently the use of outlawry was extended by statutes: to actions of account in 1285; to debt, detinue and replevin in 1352; and to actions on the case in 1504. By the end of the Middle Ages outlawry was therefore of two sorts: the ancient penalty on fugitive criminals, which operated as a conviction and attain; and the newer process to compel appearance in most civil actions excepting real actions. It soon became evident that these two outlawries could not be regarded as identical, and accordingly the second was considerably mitigated by excluding from it corruption of blood and escheat of lands, although chattels and the issues of land were still forfeit.

The use of so clumsy a weapon was made tolerable only by a strict insistence upon long and elaborate formalities; these in turn gave rise to a complicated mass of law dealing with the

reversal of outlawry for technical error in the proceedings. In many cases outlawed criminals purchased from the crown charters restoring them to the law. In such cases the courts applied the principle that outlawry utterly destroyed the offender's legal position, and that his in-lawry made him a "new man"; this new man therefore was not restored to the legal position which the old one had lost—a doctrine which had serious consequences in the sphere of property law. The famous Statute of Praemunire of 1353, which prescribed a very stringent process for certain offenses, can be considered as creating a special variety of outlawry.

In England outlawry proceedings could be ordered by several different courts, but the solemn "exactions" had to take place in the five successive sessions of a county court. Outlawry in civil proceedings was abolished in 1879. The disputed question whether it is still possible in cases of treason and felony depends to some extent on the possibility of holding a county court; the latter was in fact never formally abolished, although it may safely be regarded as obsolete. The Forfeiture Act of 1870 expressly preserved forfeiture on outlawries for treason and felony.

Although outlawry never took root as an institution in the United States, there is evidence indicating that it was occasionally employed in Virginia and perhaps in other colonies to force defendants to submit to the jurisdiction of the courts. All of the elements of outlawry may be found in the colonial practise of banishment, which often occurred, sometimes coupled with forfeiture of lands and goods and occasionally accompanied with the threat of death if the offender returned.

OUTLAWRY OF WAR. On April 6, 1927, Foreign Minister Briand of France, in a message to the American people on the occasion of the tenth anniversary of American entrance into the World War, said that "France would be willing to subscribe publicly with the United States to any mutual engagement tending 'to outlaw war,' to use an American expression, as between these two countries." Not officially noticed at the time by the State Department of the United States, this statement later became a subject of diplomatic exchange of notes; and Briand formally submitted to the United States government a proposal that the two governments "condemn recourse to war and renounce it respectively as an instrument of their national policy toward each other." On December 28, 1927, Secretary of State Kellogg suggested in reply that the treaty be multilateral and an effort be made to secure "the adherence of all of the principal powers of the world to a declaration renouncing war as an instrument of national policy." Meanwhile Senator Borah in a speech in Cleveland on May 10, 1927, had urged this idea as a precondition of the adherence of the United States. The French government demurred at first, urging that while there was no obstacle to such a treaty between France and the United States, the treaties by which other nations had bound themselves under the Covenant of the League and the Locarno agreements of October, 1925,

stood in the way of a multipartite treaty; it desired also to limit the proposal to "outlawry of aggressive wars," so-called. Further negotiations adjusted the points of difference, however, and on August 27, 1928, the Paris Pact was signed; there were fifteen original signatories including France, the United States, Great Britain, Germany, Japan and a number of secondary powers. War as a means of solving international controversies was condemned; it was renounced as an instrument of national policy, and the contracting parties agreed "that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means." The United States Senate ratified the treaty on January 15, 1929, with but one dissenting vote. By the summer of that year practically every nation had declared its adherence, and President Hoover set July 24 as the date of its formal proclamation.

The history behind this action, which reversed the entire previous course of thought regarding the legitimacy of the institution of war, included ten years of agitation and discussion carried on by the American Committee for the Outlawry of War. The "American expression," as Briand justly called it, was first used by the founder and chairman of this committee, S. O. Levinson, a Chicago lawyer, in an article published in the *New Republic*, March 9, 1918. The article pointed out that while most people took it for granted that war was resorted to illegally or criminally, actually under existing international law it was recognized as the final method for settling disputes between nations; that international law provided rules "of" war but no rule "against" war; and that since social development had been marked by the continued extension of juridical methods for settling disputes and since now only international disputes remained outside the juridical sphere and hence were lawfully settled by force, the next step was to outlaw the institution of war.

The complete project of outlawry developed by Levinson and the Committee for Outlawry included four main points: first, modification of international law to take war out of the category of legitimate means of solving disputes, this change to be effected or attended by national plebiscites to insure the education and registration of public opinion; second, revision and codification of international law to insure harmony of all its parts with the new action; third, 'he

formation of an international court of justice which should have affirmative jurisdiction with respect to disputes likely to lead to war; fourth, provision that, in accord with the tenor of article 1, section 8, of the Constitution of the United States, each nation should make offenses against the law of nations crimes under domestic law, so that war breeders would be tried and punished in their own country. All through the period of discussion and agitation the advocates of the outlawry principle insisted that its adoption be secured by mutual adhesion to a treaty. The whole course of the discussion shows that the original outlawry movement directly instigated the Paris Pact, which is historically inconceivable without it.

In his first article, written while the war was still being waged, Levinson advocated that the organized force of the world be used against a nation which violated the new provision of international law. But from 1921 he and the Committee for Outlawry took the position that the sole reliance was the organized moral sentiment of the world and that even if nations should agree to use force against a recalcitrant nation, there would be no assurance save good faith that that compact in turn would be kept. They held that there was a fallacy in the analogy between the use of force against a domestic offender and against a nation, since the latter signified the use of military force on a large scale and constituted war. Since that time, the supporters of the outlawry movement have always opposed any appeal to "sanctions."

Largely influenced by Levinson, Senator Knox, a former secretary of state, became a convert to the idea of outlawry, took part in formulating the four points already mentioned and in addresses in the Senate in 1919 and 1920 proposed and endorsed the outlawry principle. On February 14, 1923, Senator Borah, likewise a supporter of outlawry, introduced in the Senate a resolution which declared that "it is the view of the Senate . . . that war between nations should be outlawed as an institution or means for the settlement of international controversies by making it a public crime under the law of nations." It called for the preparation of a code of international law of peace based upon equality and justice; and it proposed that a judicial substitute for war be created in the form of an international court modeled on the United States Supreme Court and having affirmative jurisdiction to decide all purely international controversies, "the enforcement of its decrees"

being the same as with the Supreme Court, "namely, the respect of all enlightened nations for judgments resting upon open and fair investigations and impartial decisions and the compelling power of enlightened public opinion." This document, which Senator Borah reintroduced in December, 1927, became the Magna Carta of the outlawry movement and was directly and indirectly the prototype of the action concluded in Paris in 1928. From 1923 an active popular educational campaign for outlawry was carried on in the United States, some of its chief supporters in addition to Senator Borah being Raymond Robins, Judge Florence Allen, John Haynes Holmes, C. C. Morrison and John Dewey. Senator Walsh of Montana was a strong defender of the idea in the Senate.

The movement throughout the earlier period met opposition and ridicule as well as indifference. To some extent the former were based upon misunderstanding between the critics and the adherents of the movement. The critics represented outlawry as merely a legalistic device constructed on the theory that wars could be banished by the passing of a statute. Adherents of the movement answered that they had never claimed that outlawry could prevent by legal fiat the occurrence of wars. They argued that, as had happened in the case of private combat, it represented the substitution of law for force as the authorized method of settling disputes and that it would deprive war of its authorized social status and consolidate public opinion against it. It was argued that the moral sentiment of the world was increasingly opposed to war but was now helpless, juridically speaking, law and morals being opposed to each other, while outlawry would bring the moral and the legal into harmony with each other; and that since formulation in law has always been a great educational agency, this change would serve to crystallize the popular sentiment for peace and test its genuineness. To the criticism therefore that the legal change would not touch the causes of war, which at present are almost always economic in nature, it was replied that while law and courts have never attempted to remove the causes of disputes, outlawry would provide the conditions for a much freer and more energetic educational campaign against economic injustice than now exists; it was urged that directly, because of its economic effects, and indirectly, because of the temper of mind it breeds, the war system is the greatest foe of economic reform, that it is a cause as well as an effect of economic injustice and

that to wait for the abolition of war until economic wrongs are remedied might mean to wait until civilization is destroyed. Finally, to the objection that outlawry contemplated a legal method in substitution for all political methods of settling disputes, such as negotiation, conference, arbitration and conciliation, the defenders of outlawry replied that the abolition of the legal status of war would on the contrary give a direct stimulus to the use of these political methods and that it would make them franker and more effective by doing away with the threat of war, in the shadow of which they had always operated.

The immediate moral effect of the Paris Pact and its potential diplomatic effect were somewhat weakened by comments made by a few nations in exchange of notes, reserving certain territorial areas in the case of Great Britain and of the United States, and the "neutrality treaties" in the case of some continental nations, particularly France. There was also some ambiguity attending the notion of self-defense by a nation. The Committee for the Outlawry of War had strenuously opposed making a distinction between aggressive and defensive wars, pointing out that all nations claimed that their own wars were defensive and holding to the idea that it was the institution of war and not particular wars which were to be outlawed. As a concession to nationalist and militarist elements in various nations it was admitted in the course of the negotiations that each nation is its own judge as to whether a war in self-defense is necessary; the idea does not, however, appear in the pact itself and its legal status is doubtful in comparison with the sweeping agreement to resort to pacific means of settlement of all international disputes. In the original outlawry plan it was pointed out that the right of self-defense is extralegal and cannot therefore be touched by any law. But it was held that the actual facts of a case rather than a mere assertion of action in self-defense should be presented to the International Court for a decision as to whether a plea of self-defense was justified. This move has still to be made. In spite of these limitations, as compared with the broader scope of the original outlawry plan, the pact has been a fruitful source of international cooperation. It provides a common ground upon which nations may draw more closely together in coordination of efforts for peace. The doctrine of international non-recognition of territorial and other gains made in violation of the pact, already virtually endorsed

by the League of Nations and a corollary of the pact itself, serves as an illustration of this achievement. If it is considered that for many centuries war has been the recognized means of settling disputes between nations, that it is one of the oldest of all historic institutions and that the minds of statesmen and diplomats as well as of the military have become adjusted to war as the ultimate juridical method of settlement, the change that has been effected in the legal status of war in a short period of ten years is striking.

OVERHEAD COSTS is a term covering a related group of ideas having in common the fact that such costs cannot be traced to particular units of product, classes of customers or other divisions of the business. From the angle of accounting classification, this quality attaches to indirect as distinguished from direct costs—the former being those which are not traceable, or which it is not practicable or not pertinent to attempt to trace, by the methods available to accountancy. For example, the leather which goes into a given pair of shoes and the time of a worker devoted to making that particular leather into that particular pair of shoes (“direct labor”) are directly traceable in this way, while the hire of clerks in the general office is not so traceable and is treated as an indirect expense.

Costs may also be classified as constant costs and variable costs, the latter being called proportional costs by some foreign writers in order to indicate that their amount varies proportionately with output. This classification is too simple to fit all the facts, although it provides a rough and ready formula for the effect of variations in output well within the limits of the capacity of a plant. A more careful definition of what is usually meant by constant costs would be: costs whose amount, so far as it is determined by the technical magnitudes of production, is governed basically by the capacity of the productive equipment and organization rather than by the actual output. But any such classification must be used with discretion. An accident or deterioration which destroys productive capacity is not a reduction of this class of costs; and whether we speak of variable costs or of output costs, it sometimes becomes necessary to deal with the fact that output has numerous dimensions—number of customers, number of sales or of deliveries, weight or bulk of goods and distance delivered.

The basic fact underlying the concept of overhead costs is the economy which comes with increased utilization of productive equipment that has idle capacity. Increased output requiring enlargement of capacity may also bring economy of a different sort. This results typically from the fact that enlarged capacity makes worth while the installation of more elaborate fixed equipment, bringing lower output costs per unit; and this economy pays for the additional capital investment when the output is large enough. Since increasing output which can at first be handled with the existing plant will if it continues require additional plant capacity,

which may or may not carry with it further economies, the long run and short run effects of such increase may well be different.

The most inclusive form of analysis recognizes two elements: first, the differential in costs corresponding to an increase or decrease in output (which may not be the same because some costs are largely irreversible in their movements) and, second, all costs which cannot be assigned on the differential principle. This is a scheme of theoretical imputation, cutting across accounting categories. The differential costs have to be covered by any unit of business if it is to be worth taking as a separate increment. The rest have to be at least approximately covered by the business as a whole in the long run, but in the short run there is no such necessity; and in any case the amount borne by any given part of the business is a matter of policy and apportionment, not of controlling necessity arising from the facts of cost. So far as the decision is governed by economic law, sensitiveness of demand is likely to be the deciding factor.

This group of facts leads to two outstanding results: considerable indeterminateness of prices and output, and wastes from unused capacity. These facts have been underemphasized in English economic theory, preoccupied as it has been with static conditions of determinate equilibrium and full utilization. In the infancy of the factory system, constant costs were noted as reasons for the economy of the long hours which were one of the great abuses of this period. Later, constant costs were more prominently recognized as a justification of railroad discriminations and a cause of rate wars or cut-throat competition. Still later, such costs were seen to be general phenomena of production with fixed capital. As the appearance in the business system of economies from added output led to greater emphasis on marketing tactics for the expansion of sales and to a general increase in the scale of production, the importance of overhead costs attained further recognition. Where these economies continued up to the point at which one producer in the market was decisively more economical than two, “natural monopoly” was recognized, as in the typical public utilities. Impetus was given to the theory of overhead costs through the development of cost accounting techniques for apportioning indirect expenses. Cost allocation in the public utility field revealed the economy of off-peak as distinct from peak business, the former being desirable in that it occasioned no added capacity costs.

The expansion of off-peak business under developmental policies has helped greatly to reduce the average cost of electrical current. Similar principles can be applied to other industries with daily, weekly or seasonal peaks. A final step is taken when it is recognized that labor as well as capital is to some extent a constant cost to the employer, while its maintenance is to a much larger extent a constant cost to the laborer himself and to society at large.

One of the central features of the theory of overhead costs is the theory of discrimination. If a 10 percent increase in business can be handled with a 4 percent increase in cost, the average cost per unit will be reduced about 5½ percent; and if all goods have to be sold at the same price, the company cannot afford to cut the price farther than this in order to stimulate the added business. But if the company can make a special low price confined to the new business, maintaining unchanged its earnings from its existing business, it can make a profit by selling these additional goods at any price above 40 percent of its previous average cost of production. If there is leakage of old business into the new class so that for every unit of new business added there is one unit of old business which escapes paying the old price by shifting into the new class, then the company can afford only half as great a cut in price to the new class of business. If the new business represents a true addition to the social dividend, the interest of the concern making the discrimination corresponds with that of society. If the new business is merely taken from competitors (or shifted from the consumption of different goods) whose costs of production behave in the same way, then there is no social gain, but merely a loss to the competitors which corresponds to the private gain made by the business originating the discrimination. In such a case, the result is likely to be reprisals which may turn the gain of the original business into a loss or bring on a general state of cut-throat competition. On the other hand, if fear of reprisals prevents all discrimination, chances may be lost for developing socially worth while business.

The private advantage to be gained by discrimination, then, depends on the economy of increased volume of business, the sensitiveness of demand to reduced price, the practicability of confining the reduction to new business and the likelihood of reprisals. The social advantage depends mainly on whether the added business is newly developed or taken from another producer.

Also basic to the theory of overhead costs is the recognition that the relative magnitude of constant and variable costs as they fall upon a business is fixed not solely by physical facts but also by institutional and contractual arrangements. Constant costs are associated with fixed capital; yet the maintenance of an idle worker constitutes a larger fraction of his corresponding expenses when at work than does that of a machine. Machines can be rented on a basis of use (as has been done by the United Shoe Machinery Company), so that payment for them is on the same basis as that for direct labor while workers can be the responsible owners of a business, so that their rewards come in the same form as those of stockholders' capital in the ordinary corporation. The customary arrangement has a practical basis but is not the only possible one. When a concern buys materials, the constant part of the cost of producing them becomes a variable cost to the user; if the maker and user were integrated, the combination would show a larger proportion of constant costs than do the two concerns separately. The proportion of constant costs in business as a whole is much larger than the average of the separate concerns, especially if labor is taken into account. This fact emphasizes the waste of idle capacity when productive powers are not fully utilized and is the basis of serious discrepancies between business accountancy and correct social accounting.

Another bearing of the theory of overhead costs on general economic theory concerns the relation between the whole product and the sum of the marginal products of the separate factors. Constant costs represent factors which have no immediate marginal productivity but do have a long run marginal productivity which calls for compensation. The group of factors representing variable costs has an aggregate short run marginal productivity equal to the whole product of the industry; so that if anything is reserved for the constant factors, the variable factors must be paid less than their short run marginal productivity. This is one phase of the general problem of the advantage of added production when capacity is not fully utilized.

OVERPRODUCTION has existed to some extent at all times and in every economic epoch, but it has become a characteristic element of the economic system only under fully developed capitalism. The term overproduction can be interpreted in two ways: it can be considered either from the socio-economic or from the business standpoint. In the first case it means an excess of production or of productive resources above consumption. The resultant sinking of prices and decrease of profits, even to the point of direct loss, constitute the range of phenomena included in the business meaning of the term. Although in practice the two sets of phenomena run concurrently, in theory it is possible to separate them.

In its business aspect overproduction may be identified with profitless production. A case of purely business overproduction would be one where existing productive resources are fully employed and the balance between production and consumption is maintained, but the prices at which the output must be sold do not yield the usual profit or even entail losses. Although such a case is theoretically possible, there is none on record; this is not to be wondered at, since it would imply conduct on the part of entrepreneurs directly contrary to their striving for profit.

Overproduction of the purely socio-economic type is conceivable where reduction of profits or the incurring of losses is avoided by a proper adjustment of prices, output and production costs, the necessary extent of price change for different goods depending on the relative elasticity of their demand. Purely socio-economic overproduction may therefore be characterized as adjusted production. Such a condition, allowing for the maintenance of profits, is the aim of entrepreneurs in periods of overproduction; in isolated cases it has actually been achieved.

In contrast to overproduction, whether of the profitless, the adjusted or the combination type,

is profitable balanced production wherein, with profits at a customary level, balance is preserved between productive resources and output on the one hand and consumption on the other.

The historical instances of overproduction are much more varied than is generally supposed. A generalized conception of overproduction must abstract from the concrete historical setting and derive from an analysis of its causes and of the different degrees of intensity of its forms.

Lack of balance between production and consumption may be caused by forces operating on either side or on both and resulting in an increase in production or a decrease in consumption. On the production side there are three chief sets of causes for overproduction: first, natural occurrences, such as particularly good crops, either of raw materials or of food-stuffs, which greatly augment production without any widening of the area under cultivation; second, technical inventions which make possible increasing productivity; and, third, actual increase of the means of production—cultivation of additional land, more intensive exploitation of natural resources, the construction of new or the enlargement of capacity of old manufacturing plants—with the resultant disproportional increase of output.

On the consumption side the causes of overproduction are even more numerous. Changing fashion may result in the complete disappearance of the demand for any particular product. More lasting is the effect of technical changes or improvements which may entirely eliminate the consumption of some particular product, as central heating, for instance, displaced tiled stoves. Again, changes of locality may affect consumption and so result in overproduction. Emigration of consumers can leave local producers with no demand for their goods. The transfer of workmen, officials or troops can result in overproduction for the whole trade and housing system of a town. In the same way the transfer of an industry to a new location can cause a shutdown of the local industries dependent upon it. Furthermore consumption may fall off as a result of the saturation of demand. The demand for productive equipment and for durable consumers' goods is not continuous; and when an economy has been fully supplied with such goods, the plant and machines which produced them are thrown out of work. Once the iron industry of a country has produced the necessary railways, mere repair and upkeep are

insufficient to keep the industry operating at capacity. Consumption may decrease also because of scarcity of capital, as a result of which producers' goods and durable consumers' goods, depending for their sale on capital seeking investment, become to a certain extent unsalable. Underconsumption must also be taken into account, particularly with regard to non-durable consumers' goods, which are bought out of income and are therefore subject to decreased consumption when incomes fall. Finally, overproduction may result from excessively high prices. Whereas in the latter two cases existing needs do not crystallize into effective demand because of lack of purchasing power, here the appearance of effective demand is inhibited by excessively high prices. It is seldom, however, that rising prices and the consequent falling off of demand originate a period of overproduction; prices rise chiefly in times of overspeculation and then only for a short while.

The causes listed above determine the character and intensity of overproduction, so that it becomes either useless production or uneconomic production. In the first case the goods or the means of producing them exceed the need for them, which is inexhaustible; they are therefore simply unconsumable. In the second case the goods are not in themselves useless or unsalable, but they can be sold only uneconomically, or for less than cost. Here the demand is elastic and sales are dependent largely on price. Theoretically the lack of balance between production and consumption could be removed simply by a lowering of prices. If this is not actually done, it is because the lowering of prices would make the entire process of production unprofitable for the entrepreneur. The recognition of a particular situation as involving one or the other of these two types of overproduction is important in any attempt to correct it. If the case is one of useless production, attention must be concentrated on the creation of new needs and new uses for goods; thus capitalism has up to the present avoided the saturation of demand for producers' goods through a series of new inventions, such as the successive use for motive power of steam, gas, electricity and petroleum. Lack of success in this direction leaves as the only alternative complete cessation or restriction of production; this must be borne in mind in any evaluation of the policies of the cartel. In the case of useless production no lowering of prices can stimulate the demand. If, however, the situation is one of

uneconomic production, the problem becomes that of cutting production costs sufficiently to make profitable the prices necessary for the sale of the goods. If this can be done, overproduction both on the socio-economic and on the business side will have been overcome.

There are a number of causes which make any specific case of overproduction one of useless production: changes of fashion, of technical method, of locality, or saturation of demand. These are causes on the consumption side which eliminate needs for goods. Thus, although the sale of fashion goods, the demand for which is generally extremely elastic, may be increased by lowering prices—a situation which often results in substitution of cheap imitations to tap new layers of demand—a radical change of fashion may eliminate completely the demand for some goods, however low the price. A similar cessation of demand can result from technical changes or changes of locality or simply from the saturation of demand.

Another set of causes lead to overproduction of the uneconomic type: scarcity of capital, underconsumption and excessive prices. These operate also on the consumption side, but they are rooted in income and price relationships; they make it impossible for existing needs to be turned into effective demand. The demand, however, could be stimulated at once, if the rise in prices or the decrease in purchasing power were corrected by a lowering of prices. Even goods for which the demand is generally taken to be fairly constant, such as construction materials, could succumb to uneconomic production if scarcity of capital were the sole cause of the overproduction.

As distinct from forces on the consumption side, causes which operate on the production side—natural occurrences, technical inventions, increase of capacity—can give to overproduction the character either of useless or of uneconomic production. The result depends in any case upon the degree to which the causes are operative, what goods they affect particularly and to what extent the demand for these goods is covered normally. The demand for primary foodstuffs, such as potatoes, is so well covered that bumper crops must necessarily imply uneconomic production; lowering of prices will probably not lead to increased demand. On the other hand, usually the demand for table luxuries is completely satisfied only in the case of persons with large incomes. If in these circumstances production increases, the fate of the increased

output is simply a matter of costs and prices. If without prejudice to profits prices can be lowered sufficiently to enable the whole output to be sold, then a new balanced price is created and overproduction is avoided altogether. If prices cannot be lowered to this extent, the sale is still dependent on prices and therefore uneconomic production results. If the output were increased to such an extent as to be unsalable even with prices lowered to suit the smallest incomes, the situation would be one of useless production. The demand for the most important materials entering into productive equipment is on the whole inelastic. It does not ordinarily increase when prices sink, but only when there is promise of profits from the industries in which these goods are used. The demand for such producers' goods can be increased by the lowering of their prices only in so far as this makes possible an increase in the profitable employment of the means of production which they produce; this does not usually happen to any great extent. If the production of such basic goods suddenly rises either as a result of new technical inventions or simply because of an increase in plant capacity, the resulting overproduction tends to be of the useless production type, and no lowering of prices can increase the demand.

In this discussion of the causes of overproduction the distinction between the socio-economic and the business aspects of the phenomenon has been disregarded. Actually one is almost never found without the other; to the extent that it is possible to eliminate one, this is done at the cost of aggravating the other. At this stage, however, the relative acuteness of the socio-economic or business maladjustments depends not so much upon the causes of overproduction as upon the policy of the entrepreneurs. Since their entire strength is directed against profitless production, it is not surprising that overproduction of the purely business type, with no socio-economic element, has never been observed in practise. The important practical question therefore is whether there are definite sets of causes which bring on profitless production and others which tend to overcome it. Thus changes of fashion, of technical methods, of locality, and the saturation of demand make socio-economic overproduction unavoidable. These same causes may well result also in profitless production, since with such serious falling off of demand it is improbable that output and prices can be adjusted sufficiently to

restore profits. Nor is cutting down of supply practicable here, although it might work where overproduction resulted from other causes. Success or failure in every case is determined by the existing distribution of incomes and the range of prices and by the extent to which production must be cut to attract new buyers or increased to reduce unit costs. These factors, however, are related not to the general causes of overproduction, but to the specific social and technical conditions obtaining in particular branches of production.

Research into the history of overproduction and the relation between particular systems and definite forms of overproduction is in a very elementary stage. There is, for instance, no exact knowledge of the form of overproduction, generally known as the overcrowding of the handicrafts, which existed in the final stages of town economy and in the period of territorial economy. The only type of overproduction which has received much study is that peculiar to fully developed capitalism.

In this developed capitalistic economy there appears to be a regular alternation of upward and downward swings—running from a slump through two revival stages into a period of maximum prosperity, followed by one of capital scarcity and a crisis leading to another slump. The slump and first revival stage are often described as periods of depression; and second revival, maximum prosperity, capital scarcity and crisis as periods of prosperity. Lack of balance occurs not only in the overproduction which brings about the change from prosperity to depression; it characterizes the entire business cycle. The balanced profitable production mentioned above as a contrast to overproduction is a phenomenon of short duration occurring only at the height of prosperity. Perhaps indeed it is only an ideal which is never actually realized. The maximum output of one prosperity period is exceeded only in the following spell of prosperity when production is at its highest; in the interval therefore some plant capacity must lie idle. Indeed since productive capacity is always being increased—or, to be more accurate, since it declines in a slump but is expanded at a greater than average rate in the first and second revival stages—the maximum output of the preceding period of prosperity may be exceeded before the existing productive capacity is fully employed, and hence some of it must lie idle even at the beginning of the maximum prosperity stage. Overproduction caused by the

lagging of consumption behind available productive capacity is thus present in varying degrees through all but one stage of the cycle, although it is most pronounced during the slump, when both business and socio-economic overproduction set in. When revival begins, profitless production disappears; and since excess capacity then ceases to exercise a depressing influence on profits or on the employment of labor, overproduction is ordinarily not thought of as existing in periods of prosperity.

The ideal profitable balanced production is only one of the contrasts to overproduction found in the prosperity-depression cycle. In addition to the disequilibrium between consumption and production of the slump period, caused by decline in consumption, there are two other types of unbalanced production in the cycle. One is the result of an excess of consumption over production, a condition reflected in the using up of old stocks of goods or, for a single national economy, in the increased import of goods from abroad; it occurs chiefly in the first and second revival stages and, as indicated above, is accompanied by a condition of overproduction—incomplete employment of productive resources—in other branches of industry. Finally, unbalanced production occurs when output falls not behind actual consumption but behind demand, which cannot be fully covered even by drawing upon old stocks or by increased import. This is the disequilibrium of the maximum prosperity stage. Overproduction is thus seen to be only one of three types of unbalanced production which are inherent in the business cycle.

All the causes of overproduction cited in the foregoing discussion are found in the free market economy of developed capitalism. The most important are technical inventions, increase of the means of production, saturation of demand, scarcity of capital and underconsumption. The characteristic type of overproduction which initiates the change from prosperity to depression in modern business cycles, and which is itself the essence of the depression, is brought about by the interaction of a number of different factors. It may be described as overinvestment, since it results from saturation of demand and scarcity of capital following an increase of productive capacity.

Overinvestment must be distinguished from another form of overproduction in the modern world which, although not yet universal, is finding its way into an increasing number of

industries; this may be called prosperity overproduction, for despite the growth of demand and of consumption, overproduction persists because productive capacity outstrips capacity to consume. In most of the western world certain industries—sugar, potash, cement, brick, automobile, artificial silk, artificial nitrogen and to some extent iron, coal and nitrogen—suffer from chronic overproduction, which persists even in periods of prosperity. Here overproduction changes with the cyclical stages only in kind and degree; in prosperity the business features of overproduction disappear, but socio-economic overproduction is mitigated only slightly, and for producers' and durable consumers' goods industries. This phenomenon of prosperity overproduction lies outside the business cycle characteristic of the capitalist system in its prime; it is rather a sign of senility in the unregulated market economy of fully developed capitalism.

The course of cyclical overproduction, or overinvestment, consists of several stages, transition from one to the next being induced by attempts of entrepreneurs to escape the business incidence of overproduction. These successive stages are: the accumulation of stocks of goods; restriction of production; suspension of production; dumping, or the sale abroad of the accumulating stocks of goods at prices lower than those prevailing in the exporting country; improvement of productive processes and increase of output in order to bring down production cost per unit. A decline in prices usually marks the beginning of overproduction and accompanies it in both its socio-economic and its business aspects; only in monopolistic industries can lowering of prices be avoided. It is hardly necessary to point out that not every fall in prices is a sign of overproduction.

Despite its importance cyclical overproduction has only recently come within the focus of economic theory. Previously, in classical economic theory, overproduction was considered under two heads: the possibility of overproduction (J. B. Say's *théorie des débouchés*) and the contrast between general and partial overproduction. The key to the understanding of classical theory is the fact, curiously enough still overlooked, that it took for granted the existence of a particular economic situation, that of partial overproduction and a corresponding partial underproduction; from this assumption it follows that the price of goods which are flooding the market declines and that of goods

which are scarce rises. When it is recognized that it is this coexistence of partial overproduction and underproduction which must be explained, the matter becomes quite simple. Now the important problem for the critic is the question whether this type of overproduction was that peculiar to the early capitalist system—which seems very doubtful.

Modern overproduction theory is concerned with the overproduction peculiar to the fully developed capitalist system. Indeed it was only toward the end of the nineteenth century that it was realized that there was a special sort of overproduction characteristic of this system, prevalent through regularly recurring depression periods, and that this type of overproduction had a clearly defined though complex pattern. Modern overproduction theory is thus an organic part of the theory of business cycles (*q.v.*): to explain the appearance of overproduction is to account for the end of prosperity and to deal with its duration is to analyze the various stages of depression.

OVERSTONE, LORD, SAMUEL JONES LOYD (1796–1883), British banker and financial expert. Educated at Eton and Trinity College, Cambridge, Loyd sat in Parliament as Liberal member for Hythe during the later years of his residence at college (1816–23) but played little active part in politics. After 1826 he centered his activities upon the banking house of Jones, Loyd and Company of Manchester, in which he succeeded his father as a partner in 1844. In 1850 he was raised to the peerage as first Baron Overstone, and during the later years of his life was considered one of the richest men in England.

As early as 1832 Loyd, who expressed his opinions emphatically and lucidly and had an equal mastery of practise and theory, was recognized as an authority on finance. His advice was sought by the government on every occasion when problems arose in this field. In 1832 he gave evidence before the Parliamentary Committee of Secrecy on the Bank of England Charter and again in 1840 before the Committee on Banks of Issue; on both occasions he emphasized the need for a single bank of issue and

insisted, in accordance with the doctrine of the currency school, that the paper notes "ought to be preserved at their proper value by making them, under all circumstances, conform in amount to the coins or metallic circulation which they represent." This demand that the emission of notes should be regulated by the bullion reserve, acceptance of which involved separating the banking and issue departments of the Bank of England, was strongly opposed by Fullarton and Tooke (*q.v.*), but Peel relied so much upon the opinion of Loyd that the Bank Charter Act of 1844 was drawn up along the lines that he had suggested, although the act was subsequently modified in some important particulars. To the end of his life Loyd held the same opinions, opposing inconvertible paper, the decimal system of coinage and the development of joint stock banks.

OWEN, ROBERT DALE (1801–77), American publicist and social theorist. The eldest son of Robert Owen, he was educated in Switzerland at the school of Emanuel Fellenberg, many of whose ideas he popularized in America. He assisted his father in his socialistic colonies at New Lanark and New Harmony and from 1825 to 1828 edited with Frances Wright (*q.v.*) the *New Harmony Gazette*. Removing to New York in 1828 Owen edited the *Free Enquirer* and published the first American work on birth control. This book, which was suppressed in England in 1878 (*Regina v. Edward Truelove*), marks the beginning of the American birth control movement.

He fought after the manner of J. S. Mill for equality of the sexes and as a member of the Indiana legislature led a successful fight for a bill securing property rights for women. At a strategic moment he helped crystallize Lincoln's views on slavery. He persistently advocated free public education and helped found the Smithsonian Institution. His free thought writings though critical were temperate. His diplomatic career was undistinguished. Owen is to be remembered for his advocacy of liberalized social institutions, for his part in the organization of a Working Men's party in New York in 1829, but

chiefly as the founder of the American birth control movement.

OWEN AND OWENISM. Robert Owen (1771-1858), British socialist, social reformer and co-operative pioneer, was born in Wales, the son of a shopkeeper. His school career ended when he was nine years old and had already been two years a pupil teacher. After various apprenticeships, including service in big drapers' establishments in London and Manchester, at eighteen he went into partnership with a mechanic as a small maker of the textile machinery which was just coming into use. Later as manager for Drinkwater, one of the largest Manchester manufacturers, he built up a great reputation for the quality of the firm's yarn. In 1794 with a group of partners he established the Chorlton Twist Company and became a substantial manufacturer on his own. In 1799 with a new group of partners he purchased the famous New Lanark mills in Scotland then the property of David Dale, whose daughter he married. At New Lanark he set to work to establish a model community and to demonstrate that good wages and conditions for the workers were fully consistent with the prosperity of the business. He built up around the factory a model village; and his arrangements for the education of the children of the employees, including the children employed in the mills, contributed as much as his methods of factory management toward the world wide celebrity of New Lanark. These policies brought him repeatedly into conflict with his partners, and twice he bought them out and established new partnerships to take over the works. The last of these, formed in 1813, included William Allen, the Quaker philanthropist, and Jeremy Bentham. It was formed on the basis of limited dividends payable on capital and the use of all surplus revenue in the interests of the employees.

Extending his activities beyond New Lanark, Owen now began to play a larger part in the affairs of industry generally. He proposed a factory bill which went much further than the act which became law in 1819, usually known as Peel's Act after the elder Sir Robert Peel, who carried it through after Owen had retired in disgust at the whittling down of his proposals. Owen had demanded not only much more drastic limitation on the employment of children than the act secured but, what is even more important, the appointment of factory inspectors by the state, without which no factory act could be made really effective. This was not secured until 1833. In the period of intense unemployment and distress which followed the peace of 1815 Owen was pushing a plan for the employment of the poor and the thoroughgoing reform of the existing poor law system. He proposed the establishment of mainly self-supporting "villages of cooperation," to be employed partly in agriculture and partly in industry and to exchange their surplus products. This system was to be instituted by the state or the poor law authorities or, in default of state action, by philanthropic subscription. But it soon became clear to him that the governing classes had no intention of acting on his proposals; and shortly after he put forward his complete scheme in his famous *Report to the County of Lanark* (Glasgow 1821) he left for America, hoping that his ideas would find a more favorable reception in the New World. In the United States he founded in 1825 the community of New Harmony, and until 1829 he was occupied mainly with the affairs of New Harmony and the propagation of his ideas. Finally, disappointed with the failure of the New Harmony experiment, Owen returned to Great Britain to resume his agitation there.

There Owenite ideas, rejected by the governing classes, had been taken up enthusiastically by a large and growing section of working class opinion, with some support from middle class reformers. A cooperative movement, based on Owenite principles, had been growing up, and the trade unions, allowed to come into the open by the repeal of the Combination Acts in 1824-25, were ready to listen to his ideas. The working class, excluded under the Reform Act of 1832 from a share in political power, was more than ever prepared to listen to schemes for achieving its emancipation by industrial instead of political methods. Between 1832 and 1834 Owen found himself, almost without any action on his own

part, at the head of a great and rapidly growing working class movement determined to put his ideas into practise, to get rid of the employing class and to reorganize industry on a basis of cooperative self-government. The Builders' Union of 1832, the most powerful among the new trade unions, went over completely to Owenism and proposed to convert itself into a Grand National Guild of Builders, prepared to dispense altogether with employers and contractors and to take over the entire control of the building industry. In 1833 most of the trade unions were organized under Owen's leadership into a Grand National Consolidated Trades Union with an Owenite program; and at the same time Owen and his friends created in London, Liverpool, Birmingham and other centers a system of labor exchanges designed to provide for the mutual exchange of products made by the numerous Owenite cooperative societies of producers. Moreover in the north the Owenites, through the National Regeneration Society, placed themselves at the head of a movement for factory reform and the eight-hour day to be secured not by legislation but by industrial action. The Grand National Consolidated Trades Union at the height of its influence early in 1834 is said to have had over half a million members, and another half million are estimated to have been enrolled in associated unions, such as the Builders' Union. But the movement crumbled rapidly. The Owenites had projected a general strike to be followed by the sudden and complete institution of the new cooperative system which Owen had preached. But in fact the Trades Union, as it was commonly called, soon became involved in a large number of sectional disputes, mostly lockouts declared by employers who refused to employ anyone that admitted membership in it. Moreover the trial and transportation for the administration of unlawful oaths of the Dorchester laborers, who had formed a branch of the Trades Union, indicated the readiness of the government to go to all lengths in repressing the movement. Under these blows the Trades Union disintegrated; and in the summer of 1834 Owen, realizing its failure, decreed its dissolution. Thereafter he played little direct part in the fortunes of the organized working class movement, but for the remainder of his life he engaged in active propaganda on behalf of his ideas. He had already severed his connection with New Lanark and ceased to be an employer of labor, and from this time he devoted the

whole of his energies to a social propaganda which became more ethical and rationalistic rather than directly political and industrial. He persevered, however, in advocating the formation of "villages of cooperation"; the most famous of his experiments, the community of Harmony Hall, or Queenwood, in Hampshire, was founded in 1839 and remained a cooperative community until 1845, thereafter continuing its existence as an Owenite school. Owen lived on until 1858, and in his last years when his powers were failing became involved in spiritualist experiments. He had in fact finished his constructive work long before these later mental meanderings set in.

All Owen's practical activities were governed by certain general conceptions of man's character in its relation to his environment. From his young manhood in Manchester Owen preached consistently the doctrine that "man's character is made for and not by him" and that any required character can be given to any community of human beings by setting them in the right environment and equipping them with the right set of social institutions. Owen did not mean by this that individuality has no real existence or that the individual is merely the result of the circumstances in which he has been placed. He insisted strongly on the importance of individuality and on the large differences between one man and another; these differences he made an essential foundation of the system of education at New Lanark. He held, however, that each individual would react in a different way according to the environment in which he was placed and that men's social and ethical ideas, what in fact he meant by character, were taken by them from the institutions under which they lived. Accordingly he maintained that the contemporary evils—the competition between man and man, which he regarded as the root of social antagonisms, and the competition between country and country, which prevented a concerted effort to develop the resources of the whole world in the common interests of its inhabitants—were the result of evil social institutions, including wrong traditional doctrines, and could be eradicated by a change in these institutions and beliefs. In particular he attributed a large part of the evils to the doctrine of responsibility as preached by the churches, in that it led men to impute social misfortunes to individual sinfulness rather than to faulty social arrangements. This was the basis of his famous denunciation of all existing religions and of his

attempt to create a new rational religion based on the denial of man's individual responsibility and on the recognition that men's character is formed for and not by them. This was likewise the foundation for his system of education at New Lanark and for the numerous educational experiments which the Owenites founded at a later period in their Halls of Science throughout the country. Owen was a pioneer in the new educational methods, especially in his insistence on the inadequacy of mere book teaching, the necessity of an appeal to the eye and the ear of the child and the immense formative importance of the earliest years. He set out to find a new basis for society in place of the existing competitive system, with the idea of establishing a set of social institutions under which men would be brought to live in harmony one with another and learn from infancy the moral doctrine of social cooperation. This was for him the significance of the "villages of cooperation" which, largely on the model of his own experiment at New Lanark, he proposed everywhere to establish. For he held that if the basis of living was a small cooperative group working not for individual profit but for common service, there would be a fundamental change in men's character and all danger of class rivalries within communities or of war or competition between one community and another would be removed. Although Owen ranks as the pioneer of the cooperative movement, he had little interest in consumers' cooperation as such. The consumers' cooperative stores which grew up under the influence of his ideas, e.g. the famous Rochdale Pioneers of 1844, did not regard the retailing of goods on a non-profit making basis as an end in itself but only as a preparatory step toward the building up of a system of cooperative production and self-employment of the members which would get rid of competition and the employing class.

These ideas bear certain marked resemblances to the theory on which the Russian Communists have been working in their plans of industrialization and above all in their intensive effort to bring about the socialization of agriculture. For the Soviet experiment is not only, or even at bottom mainly, an attempt to raise the standard of life of the Russian people but far more an attempt to change the basis of their thought by bringing them under the influence of a different social and economic environment. The Russians want, as did Owen, gradually to abolish the difference between town and country and be-

tween industrial and agricultural conditions. They want to industrialize and collectivize agriculture, because they believe that only by causing the peasants as well as the industrial workers to live in an environment of collective institutions based on cooperative rather than on competitive principles can they hope to bring into existence a mental condition consistent with the successful functioning of a communist community. In other words, they like Owen believe that man's character is made for him and not by him, as the product of his social and economic environment. In fact this doctrine, now regarded as distinctively Marxian, is in effect Owenite; and it is impossible to doubt that Marx, although he regarded Owen as a utopian socialist, owed far more to him in the formulation of the materialist conception of history than has generally been admitted. Owen of course probably derived his materialism largely from Godwin, who in turn was influenced by such eighteenth century rationalists as Holbach and Helvétius. But he was the first definitely to link materialism with economic conditions and particularly with the new industrial system, and he anticipated Marx in urging that the problems of the new industrialism demanded a collective rather than an individualist solution and accordingly a radical change in the basis of social organization from competition to cooperation.

OWNERSHIP AND POSSESSION. In all systems of law a distinction is drawn between ownership and possession. It is usually said that the one is a relation of law, the other of fact. No statement could be more misleading. Whatever plausibility it has apparently grows out of the fact that possession is a term taken from everyday speech, in which it is commonly used as a synonym for physical custody. Ownership, on the other hand, always has a legal connotation. Even lawyers and legal writers tend to blend and confuse possession as used in everyday speech with the same word as a technical term of the law.

It is characteristic of legal writers that they fail to distinguish clearly between factual events and the legal consequences which the law attaches to them. Nearly all also employ the fundamental term "legal right" in very ambiguous senses. Thus in the use of terms like possession or ownership the tendency is to assume that they have only one meaning in all legal discussions, and there is consequently an attempt to make legal phenomena fit into an inadequate analytical scheme. In the present discussion when mere physical control is meant, irrespective of its legal significance, physical custody or simply custody will be used; when the word possession is employed, unless otherwise indicated, it will signify juristic possession with all its legal implications.

The assertion that a person owns an object is a summary way of stating that he has an exceedingly complex aggregate of legal rights which relate to the object, and indirectly that all the facts necessary to give him these rights exist. This may be expressed by saying that the word ownership denotes such an aggregate of rights and connotes the existence of the facts which give rise to the rights. When the aggregate of rights denoted by ownership is analyzed, it is found to consist not only of an indefinite number of rights in the strict sense or claims available against an indefinite number of persons, each of whom is under a corresponding duty, but also of a large and indefinite number of privileges, powers and immunities, in the senses in which these terms are employed in the system of Hohfeld. The number of such claims, privileges, powers and immunities changes constantly as persons are born, become old enough to owe

legal duties and die; they may vary also with the occurrence of other events. Thus ownership is still considered to exist even though some claims, privileges or powers cease to exist, as when an owner of land has granted a right of way to an adjoining landowner. In such a case the owner has no claim that the person having the right of way shall keep off the land and no power to revoke the right of way. In other words ownership does not always denote precisely the same congeries of legal relations; it is nevertheless ownership if it is of this general type. A term commonly applied to a complex aggregate of legal rights of this kind is a right in rem. Under Anglo-American law if a person owns a piece of land in fee simple, he has as against each of an indefinite, constantly changing number of persons a claim that they refrain from certain kinds of acts—trespasses, as lawyers call them—with reference to the land. In addition he has the privilege or liberty of using the land in all lawful ways. He has also the legal power or legal ability to transfer or otherwise alter or cut down the ownership. Finally, he has an immunity from having his ownership destroyed or altered without his consent except in certain specified ways, as, for example, by the exercise of the power of eminent domain by the state.

The concept of ownership has varied in different systems of law. Under the early Roman law, the so-called *jus civile*, the ownership of the principal appendages, movable and immovable, of the Roman farm was known as *res Mancipi*, and its transfer had to be by means of a formal process, *mancipatio*. Such ownership, the so-called *dominium ex jure quiritium*, or quiritary ownership, could therefore not be acquired by an informal transaction or delivery (*traditio*). Toward the close of the republican era the intervention of the praetor brought about a reform of the civil law in this respect. If a *res Mancipi* had been informally sold or otherwise alienated, and delivered, the praetor protected the alienee effectually against the theoretical *dominium* of the alienor. He gave the alienee a defense to an action against him by the quiritary owner, and also gave the former an action, the so-called *actio publiciana*, in case he had in some way lost possession of the article. This new type of praetorian ownership was said to be *in bonis*, or bonitary ownership. In this manner the praetor abolished the distinction between *res Mancipi* and *res nec Mancipi*, so that both were transferred in the same way by *traditio*. It was said that the *dominium* still remained in the alienor, in the

case of the informal delivery of *res Mancipi*, while the bonitary ownership was in the alienee. Of course this theoretical *dominium* of the former owner was a mere empty shell; in fact the only effective rights were vested in the alienee. Thus the only real difference between the informal transfer of *res Mancipi* and *res nec Mancipi* was that the resulting ownership of the alienee was protected by a different type of procedure. Not until the time of Justinian was the theoretical distinction between quiritary ownership and bonitary ownership abolished.

The aggregate of claims, privileges, powers and immunities of a Roman owner who had *dominium* was described in somewhat absolute terms as the privilege of using, diminishing or completely consuming it. Upon more careful examination it will be found, however, that this statement needs qualification, at least with respect to the two most important classes of objects, slaves and land. Ill treatment of slaves was gradually limited in the later law and the killing of them totally prohibited. Likewise the use of land was restricted in various ways. Moreover the elements of *dominium* were affected by the law of persons. Guardians might be *domini* for some purposes. As has been pointed out, quiritary ownership conferred no really beneficial rights. Here of course the situation is precisely comparable to that of the holder of a bare legal title under English law, when the whole equitable interest is vested in another; the former is usually still said to be the owner.

In English law the concept of ownership is overshadowed by the doctrine of seisin, which is so closely related to possession that all three must be considered more or less together. Indeed it may well be said that ownership as such plays little part in English law; the courts are occupied with merely the question as to which party has the right to seisin or possession. Apparently in early English law, from the days of Glanvil almost to the time of Littleton, seisin and possession were synonymous and applied alike to chattels and to land. For reasons not entirely clear but apparently connected with the fact that his remedies were very different from those of the freeholder, a person occupying land under a term of years came to be recognized as having not seisin but merely possession, a term not then in use for any other legal purpose. Possibly one reason for this denial of seisin to the termor was that he was thereby left with a power to devise his interest, a power which at

that time would not have existed if he were considered as having the seisin. Consistent with this view also was the rule that a term of years was personal property, a so-called chattel real, rather than real estate. Gradually the use of the word seisin in connection with chattels, apparently common enough in the early law, was abandoned, possession taking its place. Seisin therefore came to mean possession as of freehold, that is, the possession which a freeholder could assert and maintain by appeal to law; and possession became correct in cases where terms of years in land and interests in chattels were under consideration.

The method of transferring the seisin was the so-called feoffment with "livery of seisin," the idea of which seems to be of Germanic origin. In its essential elements this was a symbolic delivery of possession, the delivery of something, such as a clod of earth or a twig, on the land and in the name of the whole; it was considered sufficient for the two parties to be present on the land, the one by word or act giving possession to the other.

According to Maitland and Ames there remained to the disseised owner of land no more than "a right of entry and a right of action," while the disseisor, even in the case of a wrongful disseisin, became to a large extent owner; the disseisee not only lost the possibility of physical enjoyment of the land but also was unable to alienate his right of entry or his right of action or to devise his interest by will. Likewise the disseisee's wife was not entitled to dower or a husband to curtesy; and if the disseisee died without heirs there was no escheat to the lord. On the other hand, the disseisor, although he had no title to the seisin, could alienate the land, that is, he could make a feoffment and also a will; his heir would inherit; rights to dower and curtesy were recognized; and there was escheat to the lord and forfeiture to the king. Even in modern times some of these incidents of seisin still exist in a few states of the United States, although in most other states and in England they have been done away with by statute or judicial legislation.

Seisin thus seemed to bear most of the aspects of ownership, but it was after all in substance no more than possession. One holding a term of years was not seised, but could make a feoffment, whereupon his feoffee would be seised. Ames demonstrated in his famous essay that in the case of chattels results were reached which were substantially similar to those in the case of land.

The disseised owner's privilege of recapture and right of action to recover possession were inalienable. While normally upon marriage a husband became entitled to his wife's chattels, if he married a dispossessed owner of chattels he acquired no interest in them unless during the covertures he gained possession by recapture or by action. Likewise a chattel could not be taken on execution against the dispossessed owner. Even with respect to the rights of the disseisor of the chattel the parallel still holds. If dispossessed by a stranger, he was fully protected by trespass, replevin, detinue and trover. He could sell or bail the chattel; it was subject to execution and was forfeited to the crown for felony.

In the United States in perhaps a dozen states which nominally adopted the common law rules as to the disseisee's rights the chief effects of the rules were in fact substantially abolished by a simple procedural device. Treating the disseisee's interest as a chose in action, the courts in these states applied to it a doctrine that they had developed in order to make possible the transfer of choses in action, which under the earlier law were not assignable. This doctrine was that the assignment of a chose in action, while it did not theoretically transfer the title to the chose, did confer upon the assignee a power of attorney to bring appropriate actions in the name of the assignor. Applied to the disseisee, this meant that when a disseised owner made a deed of the land, the grantee, who theoretically acquired no interest under the deed, could gain possession from the disseisor by bringing an action for recovery of possession, entitling the action with the disseisee's (his grantor's) name. Thus of the old law there was left only a procedural rule requiring that the action for recovery of possession must bear the name of the disseisee.

The enactment of the Statute of Uses fundamentally altered the concept of seisin. It gave legal effect (at common law as distinguished from equity) to transactions which prior to the statute resulted in merely equitable interests, and so enabled the transfer of the legal title in new ways, without transmutation of possession, that is, without livery of seisin, the statute providing that wherever one person stood seised of land "to the use of" another, this other person should "stand and be seised, deemed and adjudged in lawful seisin, estate, and possession" of the same.

The change in meaning of the word seisin is

obvious. Yet even before the Statute of Uses seisin, like nearly all legal terms, acquired many meanings or at least shades of meaning. The seisin which was good for one purpose was not sufficient for another. Seisin to give dower, to give curtesy, to constitute a stock of descent, all differed more or less.

The term possession, since it is more general than seisin, has been the source of even greater confusion. There have been innumerable attempts to state a single, consistent coherent theory as to what constitutes possession in Roman and modern civil law. Savigny, Bruns, Windscheid, Jhering and others all attempted definitions; none succeeded. In addition to the problems usually arising from the use of one concept for different purposes, nearly all these writers, as Holmes points out in his book on the common law, were "profoundly influenced if not controlled" by Kantian or post-Kantian philosophy and tried to force legal phenomena into some such mold.

The Latin *possidere*, which was used in ordinary Latin speech, involved the Romans in exactly the same kind of difficulties as the term possession presents to Anglo-American lawyers. It is not surprising therefore that Buckland concluded that the Roman theories on the subject of possession were not "completely coherent." In Roman law the attempt to differentiate possession from physical custody was made by Paul, among other ancient writers, by the assumption that there needed to be added to custody "an intent to possess." In modern times Savigny gave this theory general currency. It was severely criticized by Jhering and others but is still held by many students. Jhering's theory was in essence that the animus necessary to give possession is no more than awareness of the particular acts one associated with the thing in question. Neither theory corresponds accurately with all the legal phenomena under consideration; recourse is therefore had to fictions, presumptions and similar devices. Possibly Paul's theory was derived from considering as typical the possession which by lapse of time in usucaption and prescription ripens into ownership. In such cases the possessor of necessity regards himself as *dominus*, since under the Roman doctrine his possession will not mature into ownership unless he has "color of title;" that is, unless he is a *bona fide* possessor. But others who for certain other purposes were said at least in some texts to be in possession, for example, the usufructuary, the *emphyteuta*

(lessee of land) or the pledgee, obviously did not have the same *animus*.

One of the chief differences between Roman and English conceptions is that in the former possession is not as a rule ascribed to persons holding for others, such as bailees; in other words they are denied the possessory remedies (interdicts). However, when pledgees and mortgagees were in physical custody they were said to be in possession, as indeed they are in modern civil as well as in Anglo-American law. On the other hand, in Roman law a tenant at will was given possessory remedies against third parties who interfered with his control of the land. Possibly this rule grew out of the fact that large tracts of public land were held in this way by members of the dominant social group. On the other hand, perhaps the ordinary bailee was customarily a small tradesman or person of similar economic status, and it may have seemed more useful to make the possessory remedy (interdict) available to the bailor.

It is often stated that at Roman law ownership could be acquired only by acquisition of possession. Here again is found the blending of things factual and things legal which leads to so much confusion. Sohm, for example, in stating that bonitary ownership could be transferred by *traditio*, declares that *traditio* means an "actual delivery of possession" (*Institutionen*, 16th ed. by Friedrich Sohm, Munich 1919; tr. from 12th German ed. by J. C. Ledlie, 3rd ed. Oxford 1907, sect. 63). The statement, connoting as it does through the use of the word "actual" a change of physical custody, is quite misleading, for Sohm subsequently states: "It is not necessary, in other words, that the change of possession should be outwardly visible," as when, for instance, the proposed transferee already has "actual control of the thing," i.e. custody. In the case of a bailment for hire a mere declaration on the part of the transferor that the purchaser shall hold as owner the thing already in his control operates as a *traditio*.

Nor can the common law writers agree as to what are the essential elements of the concept of possession. The disagreement applies to both the act of taking and the intent or state of mind which must coexist to give possession in the first instance, and also to the elements necessary for its continuance when once acquired.

Holmes' analysis may be taken as typical. Despite his criticism of the will jurisprudence of the civilians, he maintains that "to gain possession a man must stand in a certain physical re-

lation to the object and to the rest of the world, and must have a certain intent" with reference to the object (*The Common Law*, p. 216). With regard to the first requirement he points out that there must be a certain degree of power over the object; this is affected by consideration of the degree of power obtained as against other people as well as by that gained over the object. All this is vague enough, but the intent leads to further difficulty. After showing that the *animus domini* of Savigny will not apply in the common law, since bailees are in possession, Holmes concludes that "an intent to exclude others" is all that is necessary. This must not be interpreted as meaning "all others": the bailee may be ready to surrender the object to the bailor at any moment and still be in possession. This analysis, which was undoubtedly influenced by contemporary ideas that all legal interests were reducible to acts and desires of free willing individuals, leads Holmes to accept without criticism the result of a well known English case, *Bridges v. Hawkesworth* [21 L.J.Q.B. 75 (1851)], in which a parcel of banknotes was dropped on the floor of a shop by a customer and picked up by another customer before the shopkeeper knew of it. According to Holmes "common law judges and civilians would agree that the finder got possession first, and so could keep it as against the shopkeeper"; this was in fact the decision. It is obvious, however, that from the point of view of social policy the shopkeeper ought to be preferred to the customer, as in that event the article would be more likely to get back into the possession of the real owner.

The common law shows some general tendencies in adjudging possession. If a person seeks to acquire possession by capture or, more especially, by dispossessing another without his consent, there must be much greater actual physical control than in the case of acquisition of possession with the prior possessor's assent. Again where there is a dispute between two claimants to possession, both of whom to some extent have physical control, possession will be ascribed to the rightful owner even though the other was in prior possession [*Butcher v. Butcher*, 7 B. & C. 399 (1828)]. Furthermore "constructive possession," in the sense of "immediate right to possession," the possession (not mere custody) being in another, will support possessory actions, as in the case of a bailment at will.

Like the Roman law, the common law ac-

quired a list of persons in physical control of property who were not possessors. In the case of chattels these were, for example, guests in an inn who did not acquire possession of the chattels in their rooms, servants or customers in a shop. In the case of land the bailiff was refused the rights of a possessor. Thus Holmes has to resort to historical accident to account for the rule that a bailee has possession while a servant has not. To be emphasized also is the fact that as against a stranger to the title possession is substantially equivalent to ownership, entitling the person possessed to relief not merely in purely possessory actions, such as trespass, but also in actions nominally based upon ownership, such as trover for conversion. Finally, possession is not construed in the criminal law in the same way as in the civil law. The problem arises particularly in connection with the crime of larceny.

The effect of the confusion in thinking involved in the assumptions underlying nearly all discussions of the subject, both in judicial opinions and in juristic theory, is therefore that in the effort to discuss the solution of a concrete situation by means of the supposedly logical application of a single, unitary concept derived from all kinds of cases the underlying social or economic problems are frequently concealed and so overlooked. All attempts to rationalize the cases without consideration of the social policy back of each situation have of course failed. It is clear that the whole problem needs reconsideration in the light of a more realistic theory of the judicial process in action.

OXENSTIERNA, AXEL GUSTAFSSON (1583-1654), Swedish statesman. Oxenstierna studied at Wittenberg, Jena and Rostock, and

his observations there provided the bases for subsequent reforms in Sweden. He was appointed chancellor by Gustavus Adolphus in 1612, and his integrity and genius for administration soon made him the recognized leader in both foreign and domestic affairs. The military victories of the king found their counterpart in the diplomatic successes of the chancellor. In the course of Gustavus Adolphus' campaigns in Livonia, Prussia and Denmark, Oxenstierna organized the government of the conquered or occupied territory and provided a firm but humane administration which yielded the revenues necessary for maintaining the Swedish forces abroad. Gustavus Adolphus' plan for intervention in the Thirty Years' War was neither of Oxenstierna's making nor to his liking, but once begun he supported the royal projects to the end. The alliance of Protestant Sweden with Catholic France in 1635 was planned by Oxenstierna with a view to salvaging Sweden's gains from the Hapsburgs and the German princes and towns, whereas he discarded the English alliance proposed by Johan Skytte. Richelieu found Oxenstierna "an inexhaustible source of good counsel," and Lubomirski called him "a priest who lacked only ordination, a king in all but name." The treaties of Knäred, Stolbova, Altmärk and Brömsebro were largely his work. At the close of the Thirty Years' War he had fallen into disfavor with Queen Christina—hence his absence from the Westphalian negotiations.

Oxenstierna knew how to secure the loyal service of many kinds of able men, even of rivals like Skytte. During Christina's minority he carried through a series of epoch making reforms, which included in their scope the towns, the mining industry, the posts, popular and higher education, tariffs, trade and colonization. He was instrumental also in bringing about a series of reforms in national and local government. The Swedish settlements on the Delaware River were primarily the results of his efforts. With Skytte he reorganized and modernized Uppsala University. Even during the period of Christina's displeasure (1646-49) he continued to exercise considerable influence on Swedish and European affairs. His last public services were rendered as chancellor of Uppsala University and in the attempt to bring order out of the financial chaos into which the queen had plunged Sweden.

OZANAM, FRÉDÉRIC (1813-53), French historian. While still a law clerk at Lyons Ozanam in 1831 published a pamphlet attacking the Saint-Simonians and attempting to show the limitations of their social ideal as compared with that of Catholicism. In 1833 while studying law at Paris he organized six fellow students into a charitable club and upon the basis of information given him by the celebrated Sister Rosalie Rendu, sister of St. Vincent de Paul, began systematically to visit poor families. Out of this beginning grew the great society of St. Vincent de Paul, which at present has more than 11,000 branches and about 200,000 active members in all parts of the world.

Appointed professor of foreign literature at the Sorbonne in 1841, Ozanam devoted himself intensively to mediaeval studies. In his *Études germaniques* (2 vols., Paris 1847-49) he offered a new interpretation of the role played by the church during the period when the barbarians were being assimilated into Gallo-Roman civilization. Drawing upon various historical memoirs of the period he brought into relief the outstanding position of the church as an agency in effecting the transference of Roman institutions and techniques to the barbarians. Struck by the similarities between the older period and the immediate class struggle in contemporary France he constructed, with an eye to the events taking place around him, a philosophy of history and a program of religious and political action appropriate to a situation in which power was being shifted from one social group to another. His collaboration during the year 1848 on the *Ère nouvelle*, of which Maret and Lacordaire also were editors, was motivated by the desire to serve both the traditional Catholic faith and the new democratic aspirations and to show to the people, now become sovereign, that "the thought which civilized the Barbarians could still remove chaos from Europe."

The present social Catholic school considers Ozanam as one of its masters and as one who sought out and caused to be sought out the economic reasons for pauperism; who oriented Catholic charity toward preoccupations of social justice; and who worked for the settlement of the

conflicts between what he called "the power of gold and the power of despair."

PACIFISM. The word pacifism came into general use a few years before the World War as descriptive of the views of members of peace societies and of others engaged in organized efforts to prevent war. In recent discussions it has been limited to the doctrines of those who refuse to sanction war for any purpose, defensive or otherwise, in contradistinction to the views of internationalists who would secure peace by international organization, and who either take no stand on the question of military restraint or advocate placing it under the control of an international agency. This divergence of doctrine has manifested itself throughout history and has affected the programs and tactics of organized peace movements (*q.v.*) since their inception.

Pacifism, in the sense of refusal to bear or use arms, is a doctrine at least as old as Christianity; and in the sense of an aspiration toward an unarmed world is as old as Isaiah, Micah and Confucius. Both in China (Lao Tzu and Mo Ti) and in India (Gotama) there were advocates of non-violence as a method of meeting oppression centuries before Gandhi. In so far as the Christian attitude is defined in the Sermon on the Mount it constitutes a pacifist doctrine of non-resistance not only in respect to war but also with regard to the employment of force and coercion by civil and judicial authorities. Not merely by implication but explicitly it repudiates the idea that society is necessarily founded upon coercion and punishment. This view seems to have prevailed as the normal Christian attitude for about two centuries; with the accession of Constantine to power the antimilitarist attitude of the church was abandoned. Throughout Christian history, however, important minorities like the Albigenses, the Waldenses, the Lollards, the Hussites, the Dukhobors, the

Moravians and the Quakers have at various periods held the earlier attitude, and it has been the creed of Tolstoy and his followers. The pacifism of most of these sects has not been limited to interstate relationship; it has indicated equally principles which should guide individuals in their relations one with another as well as in their relation to the state. To the Christian of the first century as to the Quaker the homicide of the executioner was as criminal as the homicide of the soldier. Whatever its ultimate moral influence, non-resistance of the early Christian type has never been expressed in actual state policy; no considerable civilization has ever for long maintained itself without some force behind the law, without the policeman as well as the judge. Non-resistance has never actually worked or been given a prolonged trial in the relationship of individuals.

There is ample historical evidence that in the international field, however, non-resistance can be consistent with national security; the difficulty lies in persuading any great power to accept it and abide by it. The lesser, non-military states (e.g. Switzerland) have been as secure as the great. For fifteen years Germany has had to submit to glaring inferiority of armaments and has probably suffered less from weakness than she would have suffered from strength. Power to resist the Ruhr invasion, for instance, would have resulted in a conflict far more damaging to Germany than the unresisted or passively resisted occupation produced. The preponderance of power possessed by the Allies has not enabled them to prevent Germany from repudiating many of the terms of the Versailles Treaty. Yet the plea for increase of armament appeals greatly to popular sentiment in Germany. Likewise the fact that the undefended Anglo-American frontier has been completely safe has not discouraged the Americans from demanding equality of naval power with Great Britain.

The absolute pacifism of the religious sects is not characteristic of most modern pacifists, who while opposing war in any form do not object to the employment of the police for the maintenance of law within the state. In practise a further distinction must be made between those who, while believing in the use of military force nationally organized for purposes of national defense, oppose its use as part of any international arrangement and those who would introduce the police principle into the relationship of nations by basing national defense upon inter-

national arrangement. It is this distinction which, from the point of view of war preventing efforts—disarmament, League of Nations, outlawry of war—has the greatest practical importance. The whole peace movement of Britain and America is broadly divided between those who would endow international institutions or arrangements with the same means of defense with which the nation is endowed and those who are opposed to international sanctions of any kind. Pacifist opposition to international commitments designed to make national forces, so long as they remain, part of an internationally organized "collective system" of defense has caused the advocates of international sanctions to accuse the pacifists of reinforcing military nationalism by perpetuating the national as opposed to the international purpose of power; by causing sanctions to remain national instead of becoming international.

Currents of pacifism have developed independently of religious tradition. Humanitarian opposition to the brutalities and carnage which wars entail and aversion to the horrors of personal participation in battle are potent motivations for pacifism. Pacifist sentiment has likewise been stimulated in some quarters by the common socialist argument that modern wars, in spite of the idealistic fanfare used to stimulate and sustain them, are based upon the economic rivalries of imperialist nations. During the World War some class conscious workers in all countries refused to carry arms and to accept any type of non-combatant service, declaring that they would not fight workers of other nations in a war for profits; others urged workers to participate and "to turn the imperialist war into a civil war" for the overthrow of capitalist society.

A critical conflict of loyalties has often ensued between pacifists' ideals of non-violence and their aspiration for the freedom of oppressed minority peoples. During the revolutions of 1830 and 1848, for example, the large majority of pacifists, although sympathetic with the aims of the revolutionists, objected to their use of violence. In the United States the Quakers opposed war for the abolition of slavery; while William Lloyd Garrison, who had been a leading advocate of non-resistance, advised a cessation of pacifist activity to prevent its possible interference with the attainment of freedom for the slaves.

Government attitudes toward pacifists have varied greatly. In the states where conscription

is a peacetime institution no provision is usually made for exemption from military service. The principle of exemption on grounds of religious conviction has, however, been admitted in the American and British laws. Exemptions from combatant service were made in the United States and in Great Britain for certain classes of pacifists during the World War (see CONSCIENTIOUS OBJECTORS). Recently the United States government has refused citizenship privileges to outspoken alien pacifists seeking naturalization.

PADRONE SYSTEM. *See* CONTRACT LABOR.

PÆPE, CÉSAR DE (c. 1842-90), Belgian socialist leader. Pæpe was compelled by his father's death to terminate his studies in philosophy and law at the University of Brussels and to enter a printing office, where he worked as compositor and reader. He studied medicine from 1868 to 1870, served in French military hospitals during the Franco-Prussian War and continued to the end of his life a physician to

the poor. He was a leader in sanitary reform in France and Belgium, and one of the active members of the Société Internationale d'Hygiène.

There were three decisive steps in Paepe's ideological development. In 1859 as a law student he adopted the land reform views of his countrymen Colins and Potter. In 1861 as a printer's reader he came into personal contact with Proudhon, then a refugee in Brussels, and became a fervent anti-étatist and mutualist. In 1868 as one of the founders and a militant member of the International Working Men's Association he was finally converted to Marxist views of industrial evolution and the role of the state in the establishment of socialism. By his speeches in behalf of land nationalization at the Brussels and Basel congresses of the association in 1868 and 1869 he contributed largely to the defeat of Proudhonism and the victory of collectivism. At the Bakuninist congress of 1874, two years after the split in the association, he played a similar role in the fight against Bakuninism. In his lecture advocating the transformation of private monopolies into public services by the state and municipality, he set forth the view that the state was not per se an evil but rather a powerful machine, which in a social democracy would function for the benefit of the community. Thus the main problem was not the state versus anarchy but state monopoly versus private monopoly. This view exercised a profound influence in changing the views of leading French anarchists; Brousse's possibilism, which anticipated English Fabianism, had its roots in Paepe's theory.

In Belgium Paepe helped to found the Labor party in 1885; he was a strong advocate of universal suffrage and was also one of the sponsors of the movement for labor education and for cooperative production and distribution.

Although Paepe was thus one of the seminal minds of the French speaking labor and reform movement, no adequate biographical discussion of his significance has as yet appeared; even the date of his birth has not as yet been clearly established.

PAGANISM. See RELIGION.

PAGANO, FRANCESCO MARIO (1748-99), Italian jurist and patriot. Pagano was professor of penal law at the University of Naples. He was commissioned by Medici to project a reform of penal procedure in accordance with the principles of the Enlightenment. Advocate of the liberal ideas of the French Revolution, he incurred the hostility of the Bourbon government during the reactionary period by his defense of Neapolitan revolutionists before the Giunta di Stato; he went into exile and took refuge under the Cisalpine Republic in 1798. Returning to Naples the following year in the retinue of the French army of Championnet, he was appointed provisional member of the Parthenopean Republic and entrusted with the task of drafting the abortive constitution which, modeled upon the French, provided for two houses of representatives and a directorate of five members with a tendency toward a strong centralized power in the executive. With the Bourbon restoration Pagano was condemned to death together with other liberal patriots and against the solemn agreements of the government.

Pagano's most important work, *Saggi politici* (2 vols., Naples 1783-85; 3rd ed., 4 vols., Lugano 1831-32), belongs to the prerevolutionary period. Seeking to temper the ideas of Rousseau with those of Vico, he proposed the idea of an original state of nature, in which men live in complete independence without hardship and want. This proposal he strove to justify on a scientific hypothesis, based upon the position of the axis of the earth. With the successive inclinations of the terrestrial axis frightful catastrophes occurred which reduced humanity to the barbaric conditions described by Vico. Thus the Hebraic-Christian idea of a fall was accepted by Pagano through a scientific reinterpretation of the history of the earth. Like Vico, he explained the gradual transition from the savage state to the civilized by the spontaneous impulses of sociability and reasonableness. To Pagano, however, the force which impels men toward society is not essentially different from the force of gravity: the impetus of social life increases to the extent that men approach one another. The aim of this evolution, Pagano held, is a conscious reintegration of the state of nature,

which does not, however, represent a definitive state but the end of a historical course and the beginning of a recourse; that is, of a new barbarism. Characteristically Pagano even before the French Revolution evinced an increasing detachment from the ideas of enlightened absolutism toward which his contemporary and countryman Filangieri still inclined, turning instead toward the ideal of moderate liberty.

GUIDO DE RUGGIERO

PAINE, THOMAS (1737-1809), Anglo-American political theorist and pamphleteer. Paine, the son of a small farmer and stay maker in Norfolk, served in the English excise until 1774 and then migrated to America, armed with letters of introduction from Benjamin Franklin. Settling in Philadelphia, he plunged at once into the tense political situation. His pamphlet *Common Sense*, which appeared in Philadelphia in January, 1776, prepared the way for the Declaration of Independence in July; with its attack on the monarchy, its denial that the much lauded English constitutional system was fitted for the needs of the American colonies and its appeal to the economic advantages of independence, it crystallized the sentiment for separation. His series of publications on *The American Crisis* (16 nos., 1776-83) helped to nerve resistance during the War of Independence, in which he himself took part. Returning to England in 1787 he published *The Rights of Man* (2 pts., London 1791-92) as a counterblast to Burke's *Reflections on the Revolution in France* (London 1790) and as an exposition of the principles of government underlying the American and French revolutions. He was prosecuted by the English government for the "libels" in the second part of his book and in September, 1792, withdrew to France, where he had already been elected a member of the National Convention and where he soon became active in framing the constitution of 1793. But he could not agree with the extreme revolutionary fervor of the Jacobins, who regarded him as a reactionary. He turned to his pen, and it was in France that he wrote his *Age of Reason* (2 pts., Paris 1794-95), a criticism of the Bible coupled with a defense of deism, and *Agrarian Justice* (Paris 1797), on the problem of

the ownership of land. In 1802 he returned to America, where he spent his last years in a milieu largely dominated by Federalist rather than revolutionary thought, and hostile to him because of his religious views. Always interested in scientific and engineering problems, Paine spent many years on a scheme for building an iron bridge over the Schuylkill, and in his last years wrote a still valuable pamphlet on the causes of yellow fever.

PAINTS AND VARNISHES. Although the manufacture of paint and varnish is classified as a chemical industry, this designation does not convey a strictly accurate impression of its processes, which are in fact designed to effect the skilful blending of the raw materials used. The materials, however, have all been produced by chemical processes, some of them, as the natural earth colors and the fossil varnish gums, in nature's laboratories but for the most part in plants constructed and supervised by modern engineers. In the United States with its average yearly output during 1927-29 of over \$500,000,000 the paint and varnish industry ranks among the more important industries.

Paint is composed of suitable pigments and drying oils, reduced to the desired consistency with the addition of volatile thinners and usu-

ally contains a small amount of drier. Its manufacture, aside from the necessary technical knowledge required for proper formulation, involves grinding and mixing operations. Varnish is made by melting resins at high temperatures and combining them with oil which has also been heated so that the resins can be incorporated in the oil without precipitating; the combination is then cooled and thinners and drier are added. Enamel differs from paint in that the pigments used are ground in varnish vehicles containing resins. Shellac in the liquid form and other spirit varnishes are made by "dissolving" shellac or other spirit soluble gums in alcohol. Lacquer is a solution of nitrocellulose in volatile organic solvents. The ordinary paints, varnishes and enamels dry partly by evaporation of the volatile thinners and partly by oxidation of the drying oils; spirit varnishes and lacquers dry entirely by evaporation; while a third process, polymerization, enters into the drying of the newer "synthetic" finishes.

In prehistoric times paint was used for crude ornamentation of persons and dwellings. Gradually man came to make use of earth colors, water soluble adhesives, oils extracted from nuts and seeds, resinous exudations from trees and fossil resins found in the ground. Artists, particularly of the Renaissance, contributed much to improving the quality of paints and varnishes. Modern practises differ essentially from the ancient in their refinement and in the ability of the chemist to search for and find or create materials with the definite properties requisite for improvement.

The first manufactured pigment, which is still one of the most widely used, was basic lead carbonate, commonly known as white lead. The date of its discovery is uncertain, but there is evidence to indicate that it was known to the ancient civilizations of Rome and Greece and perhaps to the Egyptians. It was not until about 1835, however, that zinc oxide, the second synthetic white pigment, was produced in commercial quantities by LeClaire in Paris. Lithopone, which today exceeds all the other white pigments in tonnage output, was first introduced in 1874 but its use was comparatively limited until about 1920. Titanium oxide and antimony oxide are among the newer white pigments, while barytes, asbestine and silica are commonly used as "extenders."

In the eighteenth century it was the custom of painters to purchase their own pigments and to grind them in oil, while retail dealers mixed

paints to order. This was not only inefficient but in the rush season involved considerable delay. Factory manufacture, however, developed comparatively slowly. The first white lead plant in the United States was built in 1804 and the first varnish plant in 1815, both in Philadelphia. The first paint patent was issued in 1867, but the first prepared paint appears to have been sold a few years earlier. Twenty years later the manufacture of paints and varnishes began to make substantial progress, marked by an increase in plants, factories and sales. Soon after the turn of the century the chemist entered the industry and began to improve upon the rule of thumb methods in vogue and to introduce new materials; the manufacture of paints and varnishes was becoming a scientifically controlled process. Tung oil, imported from China, revolutionized the manufacture of waterproof varnishes. Within a short time it was utilized also, with lithopone, in the manufacture of flat wall paint, the popularity of which was enhanced by the general adoption of electricity, replacing the old gas-lights with their soot and reactive gases. During the World War nitrocellulose dopes came to be used for the wings of airplanes, and these were the forerunners of the nitrocellulose lacquers, which were quickly adopted by automobile manufacturers who had long sought a durable, quick drying finish that might be applied with a spray gun. There followed the development of the brushing lacquers, the popularity of which was short lived, however, because they dried too quickly for satisfactory results. It is reported that improved products of this type may be expected, but at present they appear to have been superseded by modern finishes in a large variety of tints which are quick drying (as compared with the older types of oil finishes) and of better quality; these are made with the aid of the chemist's latest creation, synthetic resins, which improve upon the natural product and have produced profound changes in the manufacture of paints and varnishes.

The United States is the world's largest producer and consumer and among the leading exporters of paints and varnishes. From a value of \$145,623,000 in 1914 the American output rose to \$340,346,000 in 1919 and \$568,976,000 in 1929. The number of wage earners in the industry increased from 16,083 in 1914 to 29,211 in 1929. A primary factor in this growth has been the increasing use, for both decorative and protective purposes, of paints and varnishes in industry. Since 1919 the unprecedented expan-

sion of building construction and the increasing "color consciousness" of consumers have provided an additional impetus. There has been a great extension of the range of pigments and solvents and there are now several thousand varieties of available paints and varnishes. From 1920 to 1930 the number of painters rose from 323,032 to 528,931; house painters rose from 248,497 to 430,105 and industrial finishers from 75,179 to 98,826. The smaller increase of industrial finishers is due mainly to the intensive adoption of mechanical painting devices, the use of which has been comparatively smaller in house painting, in part because of the opposition of skilled artisans.

While it is still essentially a small scale industry, the manufacture of paints and varnishes requires special equipment and few workers, and much of the work is automatic. One large company in 1930 began to erect a completely automatic plant in which a pneumatic conveying system is to move the raw materials from cars to storage bins, whence they are automatically to be placed into the machines and to move from one process to another until the paint cans are deposited on the shipping floor. Of the 1063 paint and varnish establishments in the United States in 1929 the majority are small and serve limited areas. More than 125 plants produce a yearly output of \$1,000,000 and over. There have been few mergers in the industry; the larger companies have grown by expansion rather than by combination.

The manufacture of paint and varnish products involves certain industrial hazards, mainly respiratory and skin diseases, which result primarily from lead poisoning and inhalation of noxious gases. The drying oils and volatile liquids commonly used are combustible and require safe storage and handling. The fumes of wood alcohol and benzol have recognized toxic effects, and industrial plants using the spray method of application are equipped with ventilators. White lead taken into the system through the mouth or nose is toxic, and in the plants where it is handled in the dry state the workmen are given adequate protection and are frequently examined for symptoms of plumbosis, which is cumulative. Mechanical accidents are likely to occur in the handling of materials, machinery operation, the use of defective tools, and ladder falls. According to one investigator only 22 percent of the accidents are caused by inattention on the part of the workers. Small plants are usually negligent in safety work. There is little legis-

lative regulation; most of the laws are designed to prevent mislabeling of paint products. Several states require that certain types of products shall carry formulae or poison labels, as in the case of wood alcohol, and in some there are regulations defining the capacity of ventilating systems to be used in industrial finishing operations.

The foreign trade of the paint and varnish industry in the United States is not sufficiently large, even under favorable world market conditions, to offer a backlog against temporary recessions in domestic consumption. Built up largely since the war, it has never amounted to more than about 5 percent of the total production, and spirited competition is being offered by Great Britain and Germany. American exports of "paints, pigments and varnishes" in 1929 were valued at \$29,119,000, imports at \$3,822,000. American sales in foreign markets are based on quality products. Because of tariff restrictions there are a number of American branch factories in Canada. Practically all of Europe's needs are supplied by domestic production, and there is a considerable surplus for foreign trade; the major producers are Great Britain, Germany, France, Belgium and Holland. American quality paints and varnishes are imported in large amounts, however, particularly by France. Japan has become an important producer with a substantial export trade, and it confines its imports to high grade varnishes and enamels. The markets of the British colonies and dominions are dominated by imports from the mother country. Since the manufacture of paints and varnishes requires over a thousand raw and semifinished materials, there is a large world trade in raw materials. Thus the United States imports considerable amounts of flaxseed (for linseed oil), wood oil, tung oil, resins, earth colors and other necessary raw materials; efforts are being made, however, to render the American industry independent of the import of basic raw materials.

Although for some years the organized paint and varnish industry in the United States, in its cooperative advertising campaign, laid stress upon the protective feature, it is now generally conceded that the aesthetic appeal of attractive color and tasteful decoration is still the primary influence upon the consumer, as it was in the earliest days. In the case of steamships, railway coaches, structural steel bridges, automobiles, agricultural implements, a protective coating is of course absolutely essential; but even here the dominating influence of color has been amply

demonstrated, particularly as applied to automobiles. The industrial consumption of paint and varnish products, for maintenance and for the finishing of manufactured products, is enormous. According to American census reports, including in this classification sales to manufacturers, railroads, government, marine and all similar users, the normal proportion of industrial sales is about 40 percent of the total; while trade sales to dealers, jobbers, painters and consumers account for the remaining 60 percent. Paint is of the utmost importance in engineering; it protects from rust and corrosion and prolongs the life of iron and steel in bridges, ships, skyscrapers, boilers and other products of modern industry; ironwork and steelwork are painted once in the factory and again after erection.

The greater part of the paint and varnish products sold through trade channels is used on architectural surfaces. Many sales are made by retail dealers of course, especially to women, for the refinishing of furniture or other small jobs about the home. Industrial consumption will immediately reflect any increase or diminution of industrial activity; paint sales are also an indication of building activity, but not to the same extent. Even at the height of the American building boom it was estimated that 75 percent or more of the painting was actually repainting of existing property, and it is this vast area of exterior and interior surfaces that represents the industry's opportunity for future expansion. Particularly is this true of interior surfaces, both because of the trend in exterior construction toward the use of the so-called permanent materials, which do not require painting, and because of the much greater area of the interior surfaces, which may conservatively be estimated at ten times that of the exterior surfaces. Modern woman is attracted by color and knows how to use it effectively in her home; the products of the paint and varnish industry are her natural tools, although considerable competition is offered by linoleums, tile, wall coverings and other decorative materials. Paints and varnishes are sold in probably 100,000 trade outlets, including hardware stores, drug stores, general stores and lumber yards. The 1930 census of distribution showed that there were about 8000 exclusive paint and glass stores with average sales which would indicate this class of store to be the logical retail outlet. Their total volume is equaled or perhaps exceeded by that of hardware stores, of which there are several times as many.

In previous business depressions a decline in

the activity of general industry and trade was accompanied by increased paint sales, the explanation undoubtedly being that skilled mechanics in other trades, while temporarily out of work, spent considerable time and part of their savings in the improvement of their property. This phenomenon was observed in the early part of the depression which prevailed after 1929, but as it became prolonged the trade sales of paint declined materially, although not to as great an extent as did industrial sales.

The American paint and varnish industry is well organized in trade associations. The National Paint, Oil and Varnish Association, which includes material and equipment men as well as paint and varnish manufacturers and wholesalers, was organized in 1888. The Paint Manufacturers' Association of the United States, established in 1899, and the National Varnish Manufacturers' Association, formed in 1903, were merged into the American Paint and Varnish Manufacturers' Association in 1926. The activities of these associations include scientific research in well equipped laboratories, promotional campaigns, the operation of a bureau to prevent unfair competition, a simplification and standardization program and a considerable number of committees composed of members from all parts of the country who are prepared to furnish pertinent information and advice upon almost any conceivable problem. The Federation of Paint and Varnish Production Clubs unites the technical men of the industry in co-operative effort; the National Association of Paint Distributors directs its attention particularly to the specific problems of wholesalers; the National Paint Salesmen's Association of the United States has recently been organized to coordinate the work of the numerous local groups; and the International Society of Master Painters and Decorators represents the organized painting contractors. In addition there are numerous local associations but no national association of paint retailers.

While the employers are thus thoroughly organized, labor organization is practically nonexistent in the paint and varnish industry, although painters in the building trade are strongly organized. Average yearly wages are not much over \$1000, considerably less than the average for manufacturing as a whole. There are no prospects that the industry will become unionized in the immediate future.

PAISII OF KHILENDAR (1722-c. 1784), Bulgarian historian. Little is known about Paisii's life. He was a monk in the monastery of Mount Athos, then the most important and most active cultural center of the Orthodox Slavs, and began there his Slavo-Bulgarian history, *Istoriya slavenobolgarskaya* (ed. by I. Ivanov, Sofia 1914; rev. ed. by N. Filipov, 1925), which he completed in 1762. This book, the first and basic work of modern secular Bulgarian literature, marks a turning point in the general national and cultural development of Bulgaria. Paisii breathed into Bulgarian literature a new spirit and provided it with a new goal: to arouse and to increase the national and historical consciousness of the Bulgarian people. He was inspired in his work by the realization that the Bulgarians were suffering under a double yoke, that of the religious and intellectual domination of the Greeks and that of the political oppression of the Turks. By means of his history he sought to reveal both to foreigners and to his own people the glories of the Bulgarian past. He recognized the value of historical consciousness as a means of national education and looked upon language and history as the most important factors in the preservation of nationality. As the sources for his work he used chronicles, annals and manuscripts found in Bulgarian monasteries as well as historical treatises by Serbs, Greeks, Russians and a few

writers of western Europe. His work was motivated solely by patriotic feeling and is in many details both uncritical and inaccurate. The Bulgarian historical figures were idealized in romantic fashion and the national enemies, particularly the Greeks, were treated with bitter antipathy. This history, which in time became almost sacred, proved clearly that the cultural backwardness of the Bulgarians and the threat to their national existence were due, on the one hand, to the particularly oppressive political and social rule of the Turks in Bulgaria and, on the other hand, to the intellectual domination of the Greeks in the fields of religion and education. Paisii's ideas found a wide following among the Bulgarian intellectuals of the church and of the lower bourgeoisie and provided the intellectual basis and impulse for the early struggle for religious and cultural emancipation and independence.

PALACKÝ, FRANTIŠEK (1798-1876), Czech historian and national leader. Palacký, whose family were members of the Bohemian Brethren, was born in Moravia and educated at Pressburg. Under the protection of Dobrovský he established himself at Prague, where he joined the patriotic Society of the Bohemian Museum, becoming the first editor of its journal in 1825. In 1829 he was made official historiographer of Bohemia, an appointment which made it possible for him to carry out his idea of a great history of Bohemia. He was elected to the Constituent Assembly in Vienna in 1848, presided over the Prague Pan-Slav Congress and in 1859 was appointed life member of the Vienna parliament.

Palacký's great reputation rests upon his *Geschichte von Böhmen* (published both in German and in Czech, 5 vols., Prague 1836-67), which has come to serve as a gospel for the Czechs. In a period when the Austrian Empire was turning from absolutism toward constitutionalism Palacký worked as the acknowledged political leader of the Czechs and as the theorist of their intellectual aspirations. The main idea of his history centers around the tradition of the Hussite revolution. Man's striving toward God as shown in the love of one's neighbor Palacký considers to be the driving force of the history of mankind. This force brought Europe to the

clash between Catholicism and Protestantism: between the idea of authority and that of individual understanding. Individual freedom and humanity were the idea at the basis of the Hussite revolution, which represented the first upheaval against the dogmatism of the church of Rome and against German violence. This revolution, said Palacký, revealed the true mission of the Czechs and was to be accepted as the program for his own time.

During the first years of his political activity Palacký favored the Austrian Empire and considered its mission to have been to defend Christian Europe against the Turks and later to protect Catholicism against Protestantism. It was Austria's modern mission to realize equality for all the races living within its borders by becoming a federation of free racial units, as defined by their cultural, geographical and historical rights. Palacký placed no trust in violent revolutions but looked instead to intellectual enlightenment. He therefore organized scientific institutions, edited various publications and was regarded not only as the political leader of the country but also as its most prominent philosopher. For a time he was confident that Austria would be federalized and all its nationalities made secure in their rights. Later, when the Germans and Magyars attained political preponderance and when the influence of Germany began to dominate Austria, he lost his faith in the empire.

A follower of Herder and of Rousseau, Palacký believed in a state of natural and primordial democracy of the human race, especially among the Slavs. He did not accept, however, the western differentiation between nation, nationality, race and kinship. A nation was for him not a political organization, but a kinship group which had attained some degree of civilization based on its natural character. A nation need not be organized as a state; the state is an accessory form which may be gained or lost without any essential change in the nation. The nation is a product of the natural order of things, but the state is an artificial structure which may either realize or suppress the natural gifts of the nation. Palacký's ideas have exercised an enormous influence on the political thought of central Europe. His most distinguished disciple is Thomas G. Masaryk.

EMANUEL RÁDL

Consult: Masaryk, T. G., *Palackého idea národa českého* (new ed. by V. K. Škrach, Prague 1926), first ed. also in German as *Palackýs Idee des böhmischen*

Volkes (Prague 1898); Fischer, Josef, *Dílo a myšlenka Františka Palackého* (Work and thought of Palacký), 2 vols. (Prague 1926-27); Lützow, F. H. H. V., *Lectures on the Historians of Bohemia* (London 1905) p. 88-105.

PALEY, WILLIAM (1743-1805), English theologian. Paley began with a protest against compulsory subscription to the Thirty-nine Articles, in his own interpretation of which he showed distinct Unitarian leanings. His subsequent writings embody the final attempt of the eighteenth century to rationalize religion. His apologetics, based on historical arguments, are to be found in *Horae Paulinae* (London 1790), his most original work, and in *The Evidences of Christianity* (2 vols., London 1794), which sought to prove the historical truth of the New Testament miracles from the otherwise inexplicable constancy in suffering of the apostles. Finally, *Natural Theology* (London 1802) presented in an elaborate form the proof of deism by the argument from design.

For Paley revealed religion was rather a means than an end in itself. A thoroughgoing utilitarian, he solved the problem of reconciling universal self-love with the good of society by introducing the promises and penalties of a future life guaranteed by religion. But unlike the radical utilitarians he came generally to conservative conclusions in his *Moral and Political Philosophy* (London 1785), although he criticizes various social abuses, severely condemns slavery and justifies great inequalities in the distribution of property only with some hesitation, as the famous pigeon analogy shows.

Paley professed to be no more than a compiler of textbooks, but although he lacks originality and profundity he can hardly be overpraised for the force and clarity with which he puts the standard arguments. His most important sources were Locke, Abraham Tucker and Edmund Law, but in fact he sums up the whole theological utilitarianism of his century. The "common sense" attitude to religion which he represents was soon to be abandoned. But as a popularizer of social and political utilitarianism he prepared the way for Bentham and the Mills, whose hostility to him is explained by his religious premises and conservative conclusions. Moreover he anticipated Bentham and was for some time much more widely read, especially at Cambridge, where his works became the authorized textbooks. The numerous editions through which they passed between 1785 and 1825 show that Coleridge, whose attacks did

much to discredit Paleyan "other worldly" morality, was correct in regarding him as the chief influence in the general dissemination of utilitarian ideas in England in the early years of the nineteenth century.

PALGRAVE, SIR FRANCIS (1788-1861), British archivist and historian. Palgrave was born in London of Jewish parentage. He practised law for a while but gradually turned his interests to historical studies. He played an important part in the revival of mediaeval studies in nineteenth century England and was a prominent figure in the discussions leading to the formation of the Public Record Office, of which he was the official head from 1838 until his death. His permanent fame rests on his editions of different series of national records, such as the *Parliamentary Writs of the Reigns of Edward 1 and 11* (2 vols., London 1827-34), the *Rotuli Curiae Regis* (2 vols., London 1835) and the *Antient Kalendars and Inventories of the Treasury of His Majesty's Exchequer* (3 vols., London 1836). He was the best known of a small group of workers who set a new standard of editing such documents, paying scrupulous regard to the details of the text and explaining the value of the records as sources of historical information. More familiar to general readers than his editions, although of less permanent value, were a series of books in which Palgrave dealt with the early history of England, the chief of which were the *History of Normandy and England* (4 vols., London 1851-64) and the *Rise and Progress of the English Commonwealth, Anglo-Saxon Period* (2 vols., London 1832). He emphasized the importance of law and legal institutions for an understanding of the political history of Great Britain and laid particular stress on the continuity of the Roman tradition in English historical development. The reputation of these works has suffered not only, as was inevitable, from the subsequent progress of research but also from the diffuseness of Palgrave's style. Their value to modern students lies in the range of Palgrave's knowledge of the sources, and his references are still worth follow-

ing up for indications of neglected materials. No English historian of Palgrave's period rivaled his combination of wide historical knowledge with thorough mastery of editorial technique, and his work supplied both stimulus and example to the scholars of the next generation.

F. M. STENTON

Works: *Collected Historical Works*, ed. by R. H. Inglis Palgrave, 10 vols. (Cambridge, Eng. 1919-22).

Consult: Gooch, G. P., *History and Historians in the Nineteenth Century* (2nd ed. London 1913) p. 286-89; Vinogradoff, P., *Villainage in England* (Oxford 1892) p. 11-16.

PALGRAVE, SIR R. H. INGLIS (1827-1919), English financier and economist. Palgrave started life as a banker and approached economics from a practical standpoint. His first important publication was a statistical study on *Local Taxation in Great Britain and Ireland* (London 1871). This was followed by various articles and monographs on banking topics, much of the material of which was embodied in *The Bank Rate and the Money Market* (London 1903). On the basis of comparisons between the money markets of London and those of the major countries of Europe—in which insufficient weight was given to the exceptional position of London in the world's financial system—Palgrave urged that the English specie reserves were too low and the bank rate too unsteady. He also protested against the suppression, after 1877, of details as to the volume of bankers' deposits held with the Bank of England; this information is now given in the weekly return. In 1875 he represented the Country Bankers' Association before the parliamentary committee on banks of issue and was himself a member of the Government Commission on the Depression of Trade and Industry in 1885. He opposed the monetary policy of the government of India and bimetallism. From 1877 to 1883 he was editor of the *Economist*.

Palgrave's most important contribution to economics was the editing of the *Dictionary of Political Economy* (3 vols., London 1894-99, and appendix 1908). This valuable work covers a wide ground, including much legal and biographical information and giving full accounts of the development of economic thought throughout the world. Almost every article is written by an outstanding authority on his subject. But having been designed for practical men as well as for students it contains perhaps too much factual material of little permanent importance

and has tended to become out of date. It was revised (3 vols., London 1923-26) under the editorship of Henry Higgs.

LINDLEY M. FRASER

PALMERSTON, VISCOUNT, HENRY JOHN TEMPLE (1784-1865), British statesman. Intensely individualistic by nature and reaching maturity at a time when old and new conceptions of society and government were everywhere in conflict, Palmerston never fully accommodated himself either to the Tories, with whom he held office as secretary at war (1809-28), or to the Whigs and Whig-Liberals, with whom he served as foreign secretary (1830-34, 1835-41 and 1846-51), home secretary (1852-55) and prime minister (1855-58 and 1859-65). Yet the remarkable administrative talent which he early displayed in the reorganization of the War Office, the eloquence which he could command in time of necessity, the extraordinary popularity which he gained through his foreign policy and the skill in managing Parliament which he developed in his latest years caused both major parties at once to covet and to fear him.

His attitude on domestic issues in general and constitutional questions in particular may be described, for want of more exact terminology, as that of a liberal conservative. His independence of mind, his kindly and sympathetic disposition, his exposure to liberal teachings and influences during his college days at Edinburgh and his enduring interest in new ideas led him to endorse nearly all the economic, social and religious reforms brought into operation during the period of his official life. Moreover his conviction that it was better to make concessions to popular or parliamentary pressure than to provoke dangerous discontent induced him more than once to sacrifice his convictions concerning the inadvisability of extensive parliamentary reform. But his lifelong wish was to keep the general structure of British society and government, including the Protestant ascendancy in Ireland, substantially intact.

In his handling of foreign policy, which ended only with his death, he was less conservative. It is true that he lacked Canning's appreciation of the force of liberal nationalism and that he usually endeavored to preserve the territorial settlement of 1815, but he protected, encouraged and even abetted the liberals of various continental states in their efforts to secure constitutional reform. For he believed that in assist-

ing other peoples to obtain constitutions of the British type he would gain for England both moral leadership and useful friends. The resentment which this impracticable and "meddling" policy aroused, intensified by the chauvinistic and sometimes intolerably offensive manner in which he conducted his diplomacy, left England almost friendless in so far as the governments of Europe were concerned; but Palmerston won for his country and himself the admiration and gratitude of countless liberals from Lisbon to Warsaw. An equally distinctive feature of his foreign policy is to be found in his inveterate war against the international slave trade. In the more conventional fields of diplomatic action his acumen, courage and resourcefulness brought him remarkable success until his influence encountered that of Bismarck.

PALMIERI, GIUSEPPE, MARQUIS OF MARTIGNANO (LECCE) (1721-93), Neapolitan economist. Palmieri abandoned a military career and lived most of his life in studious retirement. In 1787 he was appointed to the Supreme Council of Finance in Naples and four years later became director of the royal finances. It was during this period that he produced his important economic works: *Riflessioni sulla pubblica felicità relativamente al Regno di Napoli* (Naples 1787, 2nd ed. 1788); *Pensieri economici relativo al Regno di Napoli* (Naples 1789); *Osservazioni su varii articoli riguardanti la pubblica economia* (Naples 1790); *Lettera su la nuova tariffa doganale* (Naples 1790); *Della ricchezza nazionale* (Naples 1792). The majority of these works have been reprinted in Custodi's *Scrittori classici italiani* (vols. xlv-xlv and vol. xlix, p. 49-64).

As the outstanding figure in the late eighteenth century attempt to reform the complex, inefficient and antiquated system of public finance operative in Naples, Palmieri continued the work of the minister Tanucci, carrying out

many of the ideas of Broggia, Galiani and Filangieri. Not only did he cooperate in the actual process of reconstruction, but he formulated doctrines which, although drawing their general inspiration from the eclectic and moderate liberalism characteristic of most Italian economists of his age, are unique in precision, realism and breadth of view. Palmieri clearly understood that theory is modified by circumstances and that fiscal policies should be adapted to the demands and conditions of time and place. Certain basic principles should, however, be observed in all cases: convenience, ability to pay and the avoidance of injury to the economic life of the nation. These considerations led him to prefer an indirect tax on consumption. As regards the problem of customs, he held that duties on exports hindered the expansion of native enterprise but that duties on imports, if moderate and well ordered, were consistent with sound finance and in appropriate circumstances might even be imposed with a view to favoring home production. With Filangieri he was largely responsible for the great tariff reform of 1789, which constitutes a notable landmark in the financial and commercial policy of Naples. He greatly reduced internal customs and tolls, to which he was unreservedly opposed. A proponent of free private enterprise, which he considered essential to the attainment of the chief purpose of society, the realization of the greatest possible national wealth, he strove systematically to dissolve economic monopolies, privileges and exemptions of all kinds. He analyzed with great care the abuses restricting the production of silk, oil and grain, the three commodities which, in his opinion, it was of crucial importance to liberate, and insisted not only upon the reduction of taxes and state regulations but upon the abolition of the royal domain and of feudal rights in general. In the latter purpose, however, his efforts met with only partial success. His plan to simplify and rationalize public finance included the reorganization of methods of collecting revenues, the discontinuance of tax farming and the creation of a cadastre to equalize taxes on landed property. Palmieri, who has been called the Sully of the Kingdom of Naples, remains, with the possible exception of Verri, the outstanding Italian economist of the second half of the eighteenth century; his activities and writings greatly stimulated the study of economic and fiscal problems in the peninsula.

PAN-AFRICANISM. *See* PAN-MOVEMENTS.

PAN-AMERICANISM is the term commonly applied to the movement designed to promote peace, security, trade relations and general prosperity among the independent states of America. Unlike most of the European pan-movements, which represent a tendency toward union on the part of peoples of common race, speech or religion, it has primarily a regional basis and potentially it would include peoples of diverse races, languages and faiths. It is not synonymous with the phrase "all American," because it does not embrace the colonies in America or even semi-dependent Canada; nor have all the independent states of America participated to an equal degree in the movement. Perhaps a more accurate name, such as American international movement or multilateral diplomacy in America, should be used to designate the actual movement; the latter has been in existence for more than a century, although the term pan-Americanism was first employed late in the nineteenth century.

The original basis of the movement was largely idealistic. The New World, at least the greater part of it, was to be consecrated to democracy, liberty and peace in contrast to the monarchy, tyranny and belligerency of Europe. This sentiment was perhaps strongest between 1816 and 1824, when the Latin Americans were in the last stages of their struggle for independence and the security of the United States and the Hispanic American peoples was thought to be threatened by a European combination against them. During this period the leaders in the American countries thought less in national and more in continental terms.

Prior to 1889 the movement was carried on under Spanish American leadership and even thereafter many assemblies were held under similar auspices. The first assembly, the Congress of Panama (1826), revealed that the sentiment for continental solidarity had already weakened. The representatives appointed by the United States were not present, only four of the Hispanic American states sent delegates and the congress was practically a fiasco. For more than a half century after 1824 the United States seldom connected its interests with any pan-American rapprochement. Having proclaimed

the Monroe Doctrine in 1823, it frequently forgot it and turned its attention to westward expansion. Accordingly during this time the pan-American movement, which should be called more properly Hispanic Americanism, embraced only the Spanish American nations and not even all of them. Between 1826 and 1889 eleven conferences and congresses were held, the most important being those of Lima (1847-48, 1864-65), Santiago (1856) and Montevideo (1888-89); the last was devoted to international law. The comparatively weak and frequently turbulent young states were seeking security against Europe and also even then against the United States. They deemed the Monroe Doctrine unsatisfactory because it contained no guaranty of security against the United States; because there was no assurance that the United States would always be willing and able to defend them against non-American aggression; and because the doctrine tended to place them under the tutelage of the Washington government, which often insisted upon regulating their conduct toward Europe and thus limited their freedom of action.

Some thirty Hispanic American congresses were convoked after the United States renewed its interest in the movement in the late 1880's, but—except for Central America, which was struggling to revive its former unity and protect itself from the United States and Europe—the main interest of the Hispanic American nations during this later period was in economic, social and cultural matters. Political discussions of an international nature were transferred to The Hague, to the congresses held largely under the leadership of the United States and to Geneva.

Under Hispanic American auspices little was accomplished for the concrete realization of pan-American ideals. As a rule not more than nine or ten nations sent delegates and sometimes only three or four states were represented. Indeed, several calls were issued which failed to result in assemblies and, even more important, few of the agreements and recommendations framed were ever ratified, although the five states of Central America set up a court of justice which functioned feebly for ten years (1908-18). Otherwise the most important results of these Hispanic American conferences lay perhaps in the development of a pacific sentiment and in discussions which revealed accord on certain aspects of international law, such as the rights of neutrals, the status of aliens, the responsibility of states during civil war, opposition to

the employment of force in the collection of claims and the international status of *de facto* governments.

Pan-Americanism in its narrower sense refers to the movement after 1889, which was sponsored chiefly by statesmen of the United States. The outstanding leaders of this movement were Blaine, Root, Wilson, Stimson and Hoover. Blaine was the initiator; Root was the suave diplomat who sought to placate the Latin Americans with reference to Roosevelt's vigorous policy; Wilson was the democratic idealist who evoked a responsive chord in the hearts of the neighbors to the south; while Hoover and Stimson, in the latter part of their administration, attempted to repair the damage done by their immediate predecessors.

During the period of United States leadership numerous assemblies were held. To the year 1933 all but six of these—the series of international conferences of American States—were concerned with specific rather than general problems. For instance, various conferences dealt with such subject matter as sanitation, scientific problems, child welfare, international law, commerce, Central American affairs, finance, highways, standardization, the Red Cross, postal communications, education and journalism, conciliation and arbitration, trademarks, customs, geography and history, electrical communications and eugenics and homoculture. The programs of the six general conferences were devoted mainly to economic matters, although social and cultural topics were not neglected and some attention was given to arbitration, conciliation and international law.

From the days of Garfield, Harrison and Blaine to those of Franklin D. Roosevelt and Cordell Hull the interest of the United States in the nations of Hispanic America has been mainly economic, and the pan-American conferences have either directly or indirectly furthered this end. Washington diplomats have considered sanitation with something of enthusiasm because this problem has been closely connected with trade, investments and the prosperity of the Panama Canal. They have counseled peace with the notion of the prosperity resulting from peace mainly in mind. Their willingness to discuss arbitration and conciliation has been due apparently to the desire to limit the action of European states in the collection of claims and to facilitate the mediation or arbitration of American disputes. Other topics have been considered largely with the view of placating the

Latin Americans and diverting their attention from unpleasant reflections arising from the vigorous and often domineering role of the United States in the New World. These numerous assemblies moreover have furnished the Washington representatives an opportunity for "re-assuring" propaganda regarding the benign purposes of their government; and during this rather critical period in world politics it seemed wise to promote American solidarity as a safeguard for the political institutions of American governments and as a support for the views of the United States with reference to the rights of neutrals and the principles of the Monroe Doctrine. Diplomats of the United States have opposed the consideration of political matters because of a desire to avoid limiting their nation's freedom of action and to avoid provoking unpleasant if not embarrassing discussions on such important topics as the application of the Monroe Doctrine, intervention and recognition. Although they have usually avoided the placing of such topics in the programs Hispanic Americans have insisted upon discussing them, and they have continued to seek guaranties of security against both the United States and non-American powers.

The achievements of pan-Americanism proper have differed from those of Hispanic Americanism in at least three important respects: attendance at the conferences has been larger; numerous agreements have been drafted and ratified; and various international institutions have been set up. By 1931 some forty-four agreements had been signed by the various conferences—mainly the last five international conferences of American States—and each had been ratified by from two to eighteen states. The following official agencies of international cooperation moreover had been established: the Pan-American Union, which has its seat in Washington; the Pan-American Sanitary Bureau (Washington); the International Trade Mark Registration Bureau (Havana); the American Institute of International Law (Havana); the Inter-American High Commission (Washington); the Inter-American Commission of Women (Washington); the International American Institute for the Protection of Childhood (Montevideo); the Permanent Committee of the Pan-American Congress of Architects (Montevideo); the Pan-American Confederation for Highway Education (Washington); and the Pan-American Institute of Geography and History (Mexico city). In 1930 the organization of

the Inter-American Institute of Intellectual Cooperation at Havana was decided upon and by 1933 plans for it were well under way. Numerous private organizations, such as the Committee on Cultural Relations with Latin America, the Pan-American Society, the Pan-American Bibliographical Commission and the Pan-American Medical Association, had been established, most of them with headquarters in the United States.

The practical achievements of the American international movement, of Hispanic Americanism and of pan-Americanism are difficult to measure. During the period from 1833 to 1933 America enjoyed a considerable degree of harmony and cooperation. In a little more than a century only eight major conflicts occurred between the independent states of America and only four of these were of any real magnitude. For this comparatively pacific record the ideal of peace nurtured by this movement is doubtless partially responsible, despite the fact that adequate administrative machinery for dealing with the international problems in America is still lacking. The movement, especially in its more purely pan-American phase, has probably contributed to a vast growth of inter-American trade, particularly between the United States and the Central and South American countries. In 1931 nearly 30.5 percent of the foreign trade of the Hispanic American nations was with the United States and 12.8 percent with one another. Moreover in recent years billions of investment dollars have flowed from the United States toward South America; financial experts have given Hispanic American governments advice; and United States engineers, physicians, educators and specialists of every type have found profitable employment in these undeveloped nations. The pan-American movement has probably played some part in this important development as well as being in part an outgrowth of it; and it is certain that the numerous congresses and conferences have enabled the leaders of pan-America to acquire more accurate conceptions of each other's requirements and policies.

The movement toward harmony and intimacy between the independent states of America has always, however, been confronted by numerous difficulties. Impelled by motives of racial and cultural affinity or the desire for economic relationships, various nations of Europe have sought to prevent a rapprochement between the United States and the Hispanic American countries by

fostering opposing movements. Spain has promoted pan-Hispanism; France has sought to develop a pan-Latin sentiment; England and Germany have vigorously pursued their commerce and investments; and all, whatever their motives, have often criticized the policy and exaggerated the faults of the United States. Their efforts have not infrequently called forth a favorable response in Latin America, and this has been especially true of the propaganda sent out from Spain and France because these two nations from a cultural viewpoint, if not indeed from the standpoint of race, enjoy close affiliations with Latin America.

Moreover the changes and revelations of a little more than a century have tended to destroy both the ideological and the idealistic base of pan-Americanism. The political institutions of America and Europe have grown less dissimilar; the people of the United States have revealed a persistent racial and sometimes a religious intolerance; speedy means of transport and communication have annihilated continental isolation; the rapid growth of the United States has made it preponderant in wealth and power; nothing is left of the old idealistic basis save possibly a strong desire for peace and an ardent humanitarianism on the part of a small group of idealists both in the United States and in Latin America.

Perhaps the strongest conflict has been between the tenets of pan-Americanism and the national and imperial interests of the United States. Certain policies of the latter have often amounted to the negation of pan-American sentiment as conceived by Hispanic America. The spoliation of Mexico (1846-48), the "taking" of Panama from Colombia (1903), the domineering policy of Roosevelt, Taft, Coolidge and, to some extent, even Wilson in the Caribbean and in Mexico have created exasperation and apprehension; and recent tariff policies of the United States have caused offense in Argentina, Uruguay and Cuba. In fact the movement so far as it is sponsored by the United States has had very little support from Latin American intellectual leaders and statesmen.

It should be noted also that the dominant motives of the two Americas in supporting the movement have been decidedly different. In the main, the Hispanic Americans have sought security against the United States as well as Europe—security against conquest, against the employment of force in the collection of claims and against foreign domination of any sort. The

United States, on the other hand, has been seeking expansion of its trade, investments and political influence. If it has sought security, it has been the security of its expanded and expanding interests; if it has sought peace, it has not been so much a defensive peace, as in the case of the Spanish Americans, but a peace which would render the field of its economic operations more profitable. Nor have the weaker and more turbulent southern neighbors obtained from the United States the pledges of security which they have desired. No general arbitration treaty (the treaty of 1929 has been ratified only by a few of the American states, not including the United States), no pacts of self-restraint, no satisfactory definition of the Monroe Doctrine have been granted them.

Lastly, certain factors have tended to interrupt international harmony even within Hispanic America. Disputes over the navigation of rivers and unsettled boundaries have frequently caused irritation and sometimes led to war, and many of these states have been hardly less aggressive and nationalistic than the United States has been.

PAN-ISLAMISM is one of the more important movements originating from the collisions of occidental and oriental nationalisms and imperialisms. It attained its momentum by exploiting and expanding an imperialist religion and, although to a lesser extent than in the cases of similar movements, nationalisms of race, region and regime. Moreover, whereas pan-Americanism of every brand, pan-Slavism and pan-Turanism contained important progressive impulses, pan-Islamism was mainly reactionary.

The Islamic religion, which provides not merely a creed and a culture as does Christianity, but also a common law, a central sovereignty and a social system, offered a sound foundation for the formation of a general defensive alliance of its adherents. Although the superstructure of the modern Islamic state had become ruinous, there were nevertheless foundations more solid than those of any western state born of the industrial revolution, rationalist individualism and representative institutions. Pan-Islamism, however, was not an attempt to rebuild on the sound foundations but a hopeless effort to rebuttress the collapsing cupola—the caliphate.

The caliph's authority, whether in respect of its temporal or spiritual functions, had never been universally and undisputedly enforced. Subsequent to the assumption of the caliphate by Salim on the annexation of Egypt and to the absorption of the Cairene caliphate in 1517, the Ottoman caliph-sultans acquired an ascendancy over the Moslem world that was defective de jure only in respect of their not being of the tribe of Quraysh. While the Moroccan sheriffs and the Mogul rulers refused recognition, they offered no rivalry. Consequently defenders of the Islamic social system, seeking security against the invasion of western scientific industrialism, imperialist capitalism and political nationalism, turned naturally to "the sword of Islam," the Ottoman caliph. It was obvious of course that this sword had been beaten back from Vienna to Constantinople, from Cairo to Khartoum and from Calcutta to Kabul, but the weapon of pan-Islamism was to be a pen that might prove mightier than the sword.

When the sultan-caliph Abdul-Hamid II (1876–1909) came to the throne, the Mogul emperor had in 1857 already fallen captive to British imperialism and the Moroccan sultan was clearly fated to become the captive of the French. The first constitutional sultan, he abolished the constitution after it had served to

humbug western public opinion. The last constructive caliph, he worked pan-Islamic threads into the web of international intrigue behind which he tyrannized for the third of a century over the Turkish Empire. He appealed to Moslem fellowship and fanaticism to exploit the new means of contact and communication which had made of the Moslem world for the first time a more or less coherent community and to wage war against the west with its own weapons.

This diplomatic jihad, or holy war, had both a propaganda and a program. Every Moslem, of whatever race or citizenship, knew he was bound by his faith to combine with fellow Moslems. To avoid collisions with western imperialism and nationalism, the propaganda campaign was carefully camouflaged by taking advantage of a western delusion that looked on the caliphate purely as a spiritual authority. The fallacy of regarding the caliph as a Moslem pope had been accepted on the authority of early exponents of Islam, such as Mouradja d'Ohsson (1787), and had appeared in treaties between the powers and the Porte from that of Kuchuk Kainarji in 1774 down to those of Ouchy in 1912 and Constantinople in 1913. Although this fundamental fallacy caused frictions it was too convenient an ambiguity to be abandoned either by the western diplomat or by the eastern despot. For each treaty recognizing the rights of the caliphate, however restricted, was interpreted by the one as a renunciation on the part of the caliph of temporal authority in the country concerned, by the other as a recognition of it.

Begun in the course of the 1880's, the pan-Islamic propaganda and program had reached their prime before the end of the century. If Abdul-Hamid was its patron, its prophet and philosopher was the preacher and professor Jamāl al-Dīn al-Afghānī residing in Constantinople. By his death, in 1897, the whole Moslem world had been missionized. Ancient Turkish warships hobbled on perilous and impecunious voyages to show the flag of the faithful. Secret emissaries swarmed. Pan-Islamic centers were set up as far afield as Java, Tunis and Shanghai. In 1903 Abdullah Suhrawardy founded the Pan-Islamic Society of London, whose journal, *Pan-Islam*, was characteristic of the movement in the way it took color from its circumstances—lavishly using humanitarian and even socialist phrases to characterize "Asiatic" virtue as opposed to European vice.

For reasons of policy and prudence Abdul-Hamid let pass the insurrections in Egypt, Mo-

rocco and the Sudan, all obvious opportunities for putting pan-Islamism into effect. But some progress was made in unifying the two most important Islamic Sunnite and Shiite sects. For example, a congress at Kazan in 1906 agreed on joint schoolbooks and a conference at Najaf in 1911 made some advance toward doctrinal agreement. A more practical campaign was cleverly concentrated at the great annual conference of Moslems at Mecca, which became a sort of annual parliament. The caliph, as curator of the holy places, provided Turkish troops as escorts for the pilgrims' caravans, ships under the Turkish flag conveyed them from Batum to Bombay, and finally the Hejaz railroad was built by private funds, partly provided by Abdul-Hamid. This railway remains as a monument to an ideal of which it was the sole practical achievement.

In ending the Hamidian regime the Young Turk revolution also really ended the pan-Islamic movement. Although the Salonika Congress of the Committee of Union and Progress in 1911 formally subscribed to pan-Islamism, Turkish nationalism was incompatible with the internationalism of the Islamic state and of the caliphate. Indeed in so far as the Young Turk movement was international it was pan-Turanian. Moreover the effect of the Japanese expulsion of the Russians from Manchuria early in the century had been to divert Asiatic ambitions from a program of pan-Islamic reaction to one of pan-Asiatic reconstruction. Thereafter appeals to faith were replaced by appeals to force. Finally, the alliance between Turkish insurgent nationalism and German scientific militarism was not reconcilable with Islamic ideals and institutions. While the Hamidian diplomacy used the German alliance for its own purposes and for pan-Islamism, the Young Turk dictatorship was a pawn in Germany's European policy. Small wonder therefore that when pan-Islamism was put to the test in November, 1914, by the caliph's proclamation of a holy war against the Allied Powers, the response in Egypt, India and Arabia was to enlist in the ranks of his enemies. The pan-Islamic propaganda of the Austro-German war offices created some disturbing factors and caused serious diversions of forces but had no political permanence or importance.

The destruction of the existing order in the Islamic east by the World War and the disillusioning effect of the peace treaties on newly awakened aspirations caused an outburst of revolts by eastern peoples against their western rulers, in which the objective was the rejection

of western imperialism and the recognition of eastern national states. These revolts were racial, as in the case of the pan-Turanian campaign; or regional, as, for example, the pan-Indian congress of Europeanized Hindus; or regimental, as in the case of Egypt. They were neither religious nor responsive to the idea of the Islamic state. Nevertheless, a second wave of pan-Islamism, even less enduring than the first, did arise. But while the first pan-Islamic movement was Ottoman and ended with the Ottoman Empire and the caliphate, the second was Indian and ended with the first phase of the Indian nationalist movement and the collapse of the initial Hindu-Moslem concordat.

For many reasons of policy and proclivity the Moslems of India, although a minority, enjoyed a preferred position under British rule. When the British Empire replaced the Mogul Empire, the governor general replaced the great Mogul and the martial Moslems became partners of the British military in guarding the new *pax britanica*. The Moslem world accepted India as *Dar 'al-Islām*, a land under Islamic institutions, and the British raj relied on the Indian Moslem for support against the old menace of Russian imperialism and the new one of Eurasian nationalism.

The collision of the British and Ottoman empires in 1914 shook this condominium and almost shattered it forever. The Ottoman Empire was effectively broken up. Out of its bits was constructed the new Turkish national state, which made short work of caliphate, capitulations, consular courts and all the institutions of the Islamic state and the eastern empire. But whereas rank and file Indian Moslems were prepared to fight against the caliph's troops, Moslem leaders were not prepared to approve the partitioning of the caliph's dominions in the Treaty of Sévres.

The Khilāfat pan-Islamic movement began with the organization of the Khilāfat conferences in 1919. With the approval of the viceroy, a delegation to the Paris Peace Conference and to London demanded the restoration of the holy places to the caliph and the general reestablishment of his authority over his pre-war dominions. Resentment against refusal resulted in a temporary coalition between the Indian Moslems under the 'Alī brothers and the Hindu Congress nationalists—an alliance that as seriously imperiled the British raj as ever before or since. Even such pillars of the British Empire as Agha Khān, head of the Ismā'īlī sect of

Shī'a, and Saiyid Amīr 'Alī of the High Court appeared for a time as pan-Islamic protagonists against British imperialism. But the collision between the Islamism of the caliph Mohammed VI and the nationalism of Muṣṭafa Kemal, in which the former excommunicated the latter as an infidel and the latter expelled the former as a traitor, disrupted the Moslem Khilāfat. In so far as these Moslems were pan-Islamic they supported the caliph, in so far as they were pan-Asiatic they supported the ghazi as president of the Turkish Republic, and the same leaders supported both combatants simultaneously. Thus the Khilāfat Conference at Gaya in 1922 did not object to the Turkish law of November 1, 1922, reducing the caliph to a merely spiritual authority; but the Moslems of India protested against the law of March 3, 1924, abolishing the caliphate altogether. The collapse of the caliphate left the Khilāfat bombinating in a vacuum, and thereafter the movement lost itself in hopeless disputes as to the future of the caliphate. The ephemeral caliphate of Ḥusayn, king of the Hejaz, having been overthrown by ibn-Sa'ūd of Nejd, no agreement as to the next holder could even be approached. In 1926 rival Khilāfat congresses were held at Cairo and Mecca, no results being reached by either. Since then pan-Islamism has been dead or dormant. The Moslems of Egypt and Turkey are exclusively concerned with developments of internal regime, those of Arabia with internecine regional disputes and those of India with intensified racial and religious differences. But the fact that there is no present prospect of another avatar of pan-Islamism does not mean that it can be altogether ruled out of political reckoning. Islam is six hundred years younger than Christianity. Its fraternal fellowship is still enforceable. It survived a century long subversion by Mongols—pagan militarists with Christian proclivities—and may survive its subjection by Mammon worshipers—pagan nationalists with scientific proclivities.

PAN-LATINISM. *See* PAN-MOVEMENTS.

PAN-MOVEMENTS are political and cultural movements aiming to promote the solidarity of groups which are bound to each other by common or kindred language, race or tradition or by some other postulated tie, such as geographical proximity. From a broader standpoint, the great empires from the days of the Persian, the Macedonian and the Roman Empire up to the British Empire of the nineteenth century have been pan-movements based on the political, economic and cultural predominance of one nationality. The British Empire of the twentieth century and the Union of Soviet Socialist Republics try to take up and treat with new methods the old pan-problem of imperialism, the problem of the incorporation of numerous peoples of varied levels of cultural and economic development in a federative commonwealth and a single economic body. But whereas the British Empire still retains many elements of the feudal and commercial imperialism of the nineteenth century and of the domination of one race or nationality over others, the Soviet Union, guided by a super-national idea, has tried to elaborate a framework for the cooperation and cohabitation of many peoples and nationalities on entirely equal terms.

The historical manifestations of pan-movements in the more restricted sense may be classified as pan-national, pan-religious and pan-continental. Pan-national movements originated in the nineteenth century and may be regarded as an extension of national movements. The phenomenon has gained great impetus from the

nineteenth and twentieth century racial theories which have proceeded upon the assumption of a physical and psychic kinship uniting the members of a race and clearly differentiating them from other races. Pan-national movements, however, display a wide variation in origin and purpose. Some of them, such as pan-Germanism and pan-Arabism, are genuine national movements in that they are motivated by the objective of uniting populations of identical language and nationality into an actual political entity; they are distinguished from other national movements either because they stand in opposition to an alternative conception of unification on a narrower basis or because they aim to absorb into an established state external populations considered to be members of the same nationality. Others are supernational movements based upon common ethnical stock but lacking the tie of linguistic identity, although very frequently united by similarity of language. Such movements, among which the most important are pan-Slavism, pan-Turanism and pan-Africanism, vary their emphasis between cultural and political solidarity according to circumstances. Among the protagonists of Russian aggrandizement pan-Slavism has at times accreted political objectives as extreme as has pan-Germanism; at other times it has dwindled to an intangible sentiment. Basically, however, pan-Slavism, pan-Turanism and pan-Africanism have derived their *élan* from the struggles for national unification or racial emancipation which they enfold. Thus they are differentiated from a third and far more vague type of pan-national movement represented by pan-Hispanism, with its two related forms, pan-Lusitanism and pan-Iberianism; and by Anglo-Saxonism, or the pan-Angle movement. These latter have no connection with movements for national unification or racial liberation and, despite the extravagant claims sporadically advanced by overenthusiastic proponents, envisage in the political domain little more than diplomatic cooperation. Their primary objective is to nurture the sentiment of cultural kinship between nations inheriting a common language and traditions as a result of colonization or the migration of cultures.

Even less tangible are pan-religious movements, pan-Islamism, pan-Anglicanism and the dimly outlined tendency toward pan-Christi-
 anity; they bear a structural resemblance to pan-national movements in that they are built upon community of tradition and outlook, while functionally they sometimes serve to strengthen pan-

national movements, sometimes to create a rival alignment of forces.

In contrast to both pan-national and pan-religious movements, which are basically an outgrowth of the same emotional and intellectual transformation of the masses which produced the rise of nationalism, pan-continentalism represents, in however confused and imperfect a form, an attempt to overcome the forces of nationalistic particularism and to arrive at a political order not segmented by the diversity of nationality or culture but consolidated by the consciousness of common interests. The principle of unity here operative is geographical; the chief concrete movements are pan-Europeanism, pan-Asianism, pan-Americanism and Latin Americanism, the last of which alternately assumes the aspect of an integral part of pan-Americanism and of a reaction against it. The pan-Pacific movement is of only academic interest. More or less ill defined and protean in character, almost all pan-movements have at one time or another invited abuse from interested manipulators, particularly from the protagonists of imperialistic or dynastic expansion. It is, however, only by an examination of each of the more important movements that their common characteristics as well as their differences in origin, objective and influence can be clearly illuminated.

The oldest and most important pan-national movement is pan-Slavism, which originated at the end of the eighteenth century when all the Slav peoples, with the exception of the Russians, were dependent minorities incorporated in the Austrian, the Russian, the Turkish or the Prussian empire, lacking any well integrated body of culture or national literature and economically still in a primitive agricultural stage. With the awakening of national consciousness it was natural that these peoples should seek compensation for their weakness in mutual cooperation and in alliance with the "big brother," Russia. The first apostles of pan-Slavism, regarding the different Slav languages as dialects of one common language and the Slav peoples as tribes of a single nation, believed that they were preaching a genuine national movement. But the gradual appreciation of the untenability of their assumptions as well as the increasing spirit of particularistic nationalism among the Slav peoples soon drove the leaders to redefine pan-Slavism in more realistic terms as a movement aiming to assure mutual assistance among several different national movements related by

similarity of language, tradition and interest. This similarity frequently tended to acquire an undue emphasis and a spurious authenticity through pseudo-scientific attempts to reconstruct the past—attempts which sometimes descended to the level of “patriotic” falsifications. The national consciousness of the Slavs had received its first impulse from Herder, who drew their attention to their folk songs and folklore and who as a disciple of Rousseau eulogized their idyllic agricultural life. Under the influence of German romantic philosophy the Slavs sought and discovered a “Slav spirit,” embodied in popular traditions and ancient customs. The leading protagonists of this romantic phase of pan-Slavism were Czechs and Slovaks, Josef Dobrovský, Josef Šafařík and Jan Kollár. One of its most important monuments was Kollár’s poem *Slávy dcera* (‘The daughter of Sláva, 1824), a great hymn glorifying Slavism and demonstrating the German as the hereditary enemy of the Slav. Whereas the Latin and Germanic peoples were declining and their day in world history was waning or gone, the Slavs in their uncorrupted youthfulness were the coming heroes of history; but Slav unity was the prerequisite for the fulfilment of the mission of the race in the interests of all humanity.

At about the same time pan-Slavism acquired a political significance in the context of Russian imperialism. During the first revolt of the Serbs against Turkey in 1804, the czar was invoked as the protector of all Slavs and the Russification of Poles and Ukrainians was hailed as the first stage of Slavic unification. Subsequently the pan-Slav mission of Russia was translated into ideological terms by the Moscow historian, Mikhail Pogodin, and by Alexey Khomyakov, who in his poem *Orel* (‘The eagle, 1832) depicted the Russian eagle spreading its wings over all younger brethren in Germany, Austria and Turkey. To such idealistic interpretations of his role Czar Nicholas I, however, did not fully subscribe. As a strict legitimist he feared pan-Slavism as a revolutionary and irredentist force. He therefore tried to promote a substitute policy of Russification within his empire. The result was the alienation of many Poles, typically represented by Adam Mickiewicz, who identified pan-Slavism with his national messianism and looked upon Russia as the incarnation of the evil principle among the Slavs. The czar’s attitude was indicative of a fundamental and persistent difference of outlook between Russia and the other Slav peoples; for Russia pan-

Slavism was a weapon to be utilized in disrupting successively the Turkish and the Austrian empire, whereas for the subjected Slavs it was a means of attaining national independence. Frequently they were themselves compelled to struggle against Russian imperialism, and their debt to western liberal thought tended to heighten their distrust of Russian autocracy and orthodoxy.

The first major event in the history of pan-Slavism was the Congress of Prague held in June, 1848, under the presidency of František Palacký. Summoned in the atmosphere of nationalistic and liberal sentiment then pervading central Europe, the congress was designed by the Austrian Slavs to secure united action in the interests of democratic reforms and of strengthening their position against the Germans and the Magyars. Although it failed to produce any immediate practical results, partly because of the intense conflicts of interest among the different Slavs, partly because of its premature termination by the Prague uprising of June 12, the congress had a tremendous psychological effect upon the half forgotten peoples whose spokesmen had for the first time proclaimed to the nations of Europe the will of the Slav race to exist. The spirit of liberty of 1848 had invested the congress with a distinctly anti-Russian bias, but the ensuing reaction in Austria drove the Slavs into a rapprochement with Russia from which only the Poles and Ukrainians remained aloof. The second pan-Slav conference was held in Moscow in 1867. Pan-Slav tendencies in Russia were strengthened by this conference and were further accelerated by the subsequent publication of *Rossiya i Evropa* (St. Petersburg 1871), a work by the Slavophile Nikolay Yakovlevich Danilevsky, and of *Mnenie o vostochnom voprose* (Moscow 1869; tr. by T. Michell as *Opinion on the Eastern Question*, 2nd ed. London 1876) by General Rostislav Fadeyev. The latter work revived and reinterpreted the political aspects of pan-Slavism, formulating a gospel which under the influence of Count Ignatiev was put into effect in the Russo-Turkish War of 1878.

For the next two decades pan-Slavism was seriously hampered by internal dissensions and rival movements. Not only did Russian pan-Slavism become more decisively dedicated to a reactionary and nationalistic policy of Russification, but the growing hatred between Serbs and Bulgars weakened pan-Slav sentiments on the Balkan Peninsula; while in Poland the Na-

tional Democrats under the leadership of Roman Dmowski developed and pursued a pan-Polish ideal, claiming for Poland, with complete disregard of ethnographical factors and national tendencies, the *Polonia magna* of the Jagellon dynasty—a vast territory reaching from the Baltic to the Black Sea and including Lithuania, White Russia and all of the Ukraine. It was principally through the initiative of the Czechs, who were inspired by the desire to create a counter movement against pan-Germanism, that pan-Slavism was revitalized. The centenary celebration of Palacký's birth held in Prague in 1898 became the occasion of a great pan-Slav demonstration. In many ways this new phase of pan-Slavism showed an advance in the direction of realism and of a clearer definition of objectives. A number of new pan-Slav movements were founded, such as unions of Slav journalists, congresses of Slav students, federations of Slavic gymnastic associations (Sokols); an attempt was even made in the Cyril and Methodius movement to achieve a reunion of all the Slav churches and to substitute the old Glagolitic liturgy for the Latin. During the same period the pan-Slavs turned their attention for the first time to economic issues, discussing economic cooperation, the creation of a pan-Slav bank and the inauguration of pan-Slav exhibitions and fairs. These ideals, however, were never realized. Internal dissensions among the Slavs, but more especially the shadow cast by the Balkan Wars, turned the various congresses, held at Prague in 1908 and in 1912, at St. Petersburg in 1909 and at Sofia in 1910, into vague although forceful demonstrations paving the way for the World War, which had its immediate origin in pan-Slav aspirations and which was interpreted by the pan-Slavs as the ultimate struggle between Germans and Slavs for the supremacy of eastern Europe.

The World War marked the end of pan-Slavism. Russia, transformed into a supernational federation, abandoned all interest in Slav nationalism. By the reconstruction of Poland, by the union of Czechs and Slovaks and of Serbs, Croats and Slovenes, by the destruction of German hegemony in central and eastern Europe and by the inclusion in the new Slav states of territory inhabited by Germans some of the pan-Slav dreams were partially fulfilled. On the whole, however, the barriers between the different Slav peoples have been accentuated rather than diminished and there has been slight manifestation of a willingness on the part of the

new states to wrestle cooperatively with the difficulties, economic and otherwise, with which they are faced. The rivalry and hatred between Serbs and Bulgars and between Poles and Ukrainians have become intensified, while the Macedonian and the eastern Galician questions have continued to embitter public sentiment. In Yugoslavia the domineering spirit of the Serbs and the autocracy of the king have produced a dangerous estrangement among Serbs, Croats and Slovenes, which comes as a melancholy epilogue to the fulfilment of the longings of a century for national independence and unity.

Pan-Germanism, which has had a history only slightly briefer and less significant than that of pan-Slavism, began simultaneously with German nationalism and had as its initial objective the incorporation of all German peoples into a single state. Since German unification would require the dissolution of the numerous German dynastic states descended from the feudal period, pan-Germanism became an essentially revolutionary movement, deriving its support from democrats and liberals and sponsored by the students' unions, or *Burschenschaften*, after 1813 and by the Frankfort parliament of 1848. A realistic argument for the pan-Germanic conception of unification was furnished by economists like Friedrich List, who stressed the necessity of creating one comprehensive economic unit extending from the Rhine to the Black Sea. As the movement for national unification gained momentum and approached fruition its protagonists gradually became polarized into two factions, one upholding the pan-Germanic conception of a greater Germany, the other pursuing the Prussian idea of unification with the exclusion of Austria. Following the triumph of the latter idea through the fulfilment of Bismarck's program in 1871, pan-Germanism in its traditional form continued to be propagated by Austrians under the leadership of Georg von Schönerer. Within the new German Empire, however, pan-Germanism underwent a process of metamorphosis. It became associated with a program of aggressive expansion, which was grounded in tradition in so far as it sought to perpetuate the old *Drang nach Osten* in its characteristic forms of German colonization and cultural penetration in Slav territory, but which in its emphasis was a reflection of new conditions resulting from the rapid ascent of Germany to a leading industrialized world power. One of the primary objectives of the All-deutscher Verband founded in 1890 was to

promote colonial expansion; as such pan-Germanism was a pan-movement only in name, not differing in reality from the imperialistic tendencies then prevalent in England, France and the United States. Somewhat more germane to the original pan-German ideal was the conception of *Mitteleuropa* propagated during the World War by Friedrich Naumann; this conception envisaged the creation of a central European union which with Austria and Germany as the nucleus might be gradually expanded to include the Teutonic Flemish, Scandinavians and Dutch and possibly even such peoples as the Greeks, Bulgarians, Turks and Rumanians. As an aggressive movement pan-Germanism had found and still finds powerful support in the theory of Teutonic racial superiority, elaborated principally by Count Gobineau and H. S. Chamberlain. Although it is only one phase of the Aryan doctrine which has been placed in the service of various other national or pan-national movements, such as Anglo-Saxonism, the Teutonic theory represents perhaps the most noteworthy example of the adaptation of racial science, or pseudo-science, to expansionist purposes.

During the post-war period pan-Germanism regained some of its historical significance and revolutionary fervor. Its concrete objective was the political unification of all tribes of German race and language, to be accomplished by the union, or *Anschluss*, of Austria with Germany and by the absorption of the millions of Germans living in compact masses beyond the German frontiers, especially in Czechoslovakia. A somewhat mystical element also pervaded the revived pan-Germanism, the ideal of constructing a third German empire to restore the political and moral authority which Germany had exercised in the first, or mediaeval, empire and on a more restricted scale in the Bismarckian empire. Many of the groups promoting the German nationalistic revolution of 1933 were animated by a faith that it was the mission of the Reich to erase the boundaries drawn in central and eastern Europe by the peace treaties and to incorporate Slav and other peoples into a vast federation which would form a self-sufficient economic unit and would provide a field for the resumption of Germany's historical task in the east.

Among the other pan-movements analogous to pan-Germanism and pan-Slavism, in that they are associated with movements for national or racial regeneration, are pan-Turanism and pan-

Arabism. These movements, both of which date from the beginning of the twentieth century, reflect the recent emergence of the national idea and of racial consciousness in Asia. Pan-Turanism originated with the Young Turkish Committee of Union and Progress, who in their efforts to strengthen their position conceived the idea of an alliance with the other Turkish speaking peoples living in central Asia (Turan), the ancestral homeland of the Turk; in the Caucasus; at the lower Volga; and in the Crimea. Since kinship of race and language formed the basis of this movement, it was similar in structure to pan-Slavism. Making it possible for the Turks to bore through the layers of Islamic, Persian and Arabic culture and to rediscover the origins of their race and tongue, it stimulated their racial pride and provided them with the myth of a glorious past holding out the prospect of a rich future. As the other Turkish peoples were subject to Russia, pan-Turanism provided Turkey with as useful a weapon against her old enemy Russia as pan-Slavism had proved for Russia in the latter's struggles against Turkey and Austria. After the Bolshevik revolution, when the Soviet Union entered into a rapprochement with Turkey and admitted the Turkish peoples within Russia on terms of complete equality with the other Socialist republics, the new generation of Turkish leaders abandoned the impracticable idea of pan-Turanism to concentrate upon the regeneration of Turkey proper. The cultural implications of the pan-Turanian movement, however, the glorification of the pre-Islamic past, the attempt to create a "pure" Turkish language divested of all Arabic and Persian elements, were retained in Turkish nationalism under the leadership of Mustafa Kemal Pasha. Thus to a certain extent pan-Turanism has served its purpose and may now be said to have receded into obscurity.

Pan-Arabism in contrast to pan-Turanism is a national rather than a racial movement and aims definitely at the creation of an Arab state or federation to include Arabia proper with Nejd, Hejaz and Yemen, Syria, Palestine and Iraq—all regions formerly belonging to the Ottoman Empire and predominantly Arabic in population; according to the project the Arabic speaking countries of northern Africa are to be united with the Asiatic state by means of alliances, tightly drawn in the case of Egypt, looser and more problematical in the case of the more remote territories. The aspirations of the pan-Arabs to rise out of the condition of political

subjection and impoverishment into which they had been plunged by foreign imperialism and dynastic aggression were first proclaimed by the Arab National Committee in 1905 and seemed about to be realized at the end of the World War. The British government in its famous correspondence with the shereef of Mecca, who became later the first king of Hejaz, promised to create an independent Arabic federation. That the hopes of the Arabs were premature soon became apparent with the disclosure by the Soviets of the secret war treaties between the imperialistic powers, with the partitioning at the Conference of San Remo in 1920 of the most valuable portions of Arabian territory into mandates under the Allies and with the various manoeuvres by England and France to gain a political and economic hold over the Mediterranean coast. But the mounting evidence of an undiminished imperialistic urge on the part of the western powers seemed only to fortify the longings of the Arabs for emancipation and unity. In union they have placed their hopes not only of independence but of progress, for they realize that in no other way can they overcome their weakness in human, economic and cultural resources. The three most important independent Arabian rulers, Imam Yahya in Yemen, King Ibn Sa'ūd in Hejaz and Nejd and King Faisal of Iraq, have been strong pan-Arabs. Mecca and Bagdad have become the centers of pan-Arab agitation; in 1931 a pan-Arab conference was held in Jerusalem, another is scheduled to meet in December, 1933, in Bagdad. But enormous obstacles, internal as well as external, stand in the way of Arabian unity. Although pan-Arabism is still gathering momentum and seems certain to play a very important role in the future of the Near East, the way to its realization is far from predictable.

Pan-Africanism is somewhat difficult to classify. As an effort to unite a race in the struggle for emancipation it resembles such supernational racial movements as pan-Slavism; it differs from pan-Slavism, however, in that it has no basis in national or a congeries of national aspirations and none in a common linguistic fellowship. The Negro race, virtually everywhere subjected to the white race, is totally lacking in national traditions and sentiment; tribal consciousness has developed rather into a racial consciousness, the unifying principle of which is essentially negative—a common resentment against the political and social oppression victimizing practically all Negroes. Not yet advanced beyond

the embryonic stage, pan-Africanism is still little more than a tendency reflected in a number of unarticulated movements. Its leadership has been derived chiefly from Negroes residing in such places as the United States or the West Indies or from "educated natives" in Nigeria and Cape of Good Hope who have come into close contact with western civilization and have therefore suffered more keenly from racial discrimination.

The influence of western ideas is spectacularly manifested in the work of Marcus Garvey, a Negro from Jamaica, who saw no incongruity in applying to the African situation the principle of nationalism. The Universal Negro Improvement Association, which Garvey founded in New York in 1904, advocated "the uniting and blending of all negroes into one strong, healthy race." This African pan-national movement imitated the older national movements in all details, sometimes in their most absurd details, as, for instance, when it preached the "idea of God as a creature of imaginary semblance to the black race." While most of Garvey's aims were highly fantastic, he was undeniably animated by an arresting idealism, and his checkered career in the United States and Jamaica throws a glaring light on the position and emotions of the Negro race today. The association has published a newspaper called the *Negro World* and its annual conventions have been attended by Negroes from Africa and other parts of the world. The convention of 1920 drew up a Declaration of Rights of the Negro Peoples of the World, a lengthy and pathetic document. Garvey attempted to settle some of his adherents in Liberia but failed, probably as a result of foreign intervention.

Repudiating Garvey's idea of creating a Negro state as impracticable and limiting their aims to the extinction of racial discrimination against Negroes throughout the world, certain more conservative and educated Negroes organized the Pan-African Congress, the first meeting of which was held in Paris in 1919 and was attended by delegates from Negro groups in about fifty different countries. The second congress, held in 1921, urged a thorough investigation of the Negro labor problem, while in 1923 the third petitioned the League of Nations to send direct representatives to the mandated territories for the purpose of investigating conditions and also to appoint Negroes to the Permanent Mandates Commission of the League and to the International Labor Office. The fourth congress, in

1927, demanded a measure of self-government for the Negroes, protection of the rights of natives to the land, modern facilities for education and recognition of the principle that Africa should be developed for the Africans and that civilized men should be treated as civilized men despite differences of birth, color or race.

Centers of pan-African propaganda exist also in Africa, particularly the national congresses which meet periodically in British West Africa and in South Africa and the recently established native Christian churches and sects, called generally Ethiopian or National African churches. Pan-Africanism has received considerable encouragement from the Communist International, both because the movement represents a revolt against capitalistic imperialism and because it harmonizes with the Soviet policy of obliterating the color bar and recognizing the complete equality of the races. Early in 1930 the Red International of Labor Unions adopted a detailed resolution on the question of the Federation of Non-European Trade Unions in South Africa, and subsequently there appeared a *Trade Union Program of Action for Negro Workers of the World* couched in the well known terminology of the Moscow International. At a conference held in Haniburg in 1930 the International Trade Union Committee of Negro Workers, which had been elected one year previously at the second congress of the League against Imperialism, denounced the "bourgeois" Negro movements, like Garveyism and the Pan-African Congress, accusing them of misleading the Negro masses. But since the emphasis of the conference was upon the necessity for a unifying organization of all Negro masses, it outlined in effect a new type of pan-Africanism to replace the older types—a "proletarian" movement as opposed to the "bourgeois." In whatever form it is eventually consolidated, pan-Africanism bids fair to become a growing force and to constitute one of the major problems of the twentieth century.

The category of cultural pan-movements, based rather on tradition and sentiment than on the compulsion of common interests and aiming fundamentally to create a general rapprochement rather than to effect a political reorganization or to emancipate an oppressed race, is represented most prominently by Anglo-Saxonism and pan-Hispanism, the former aiming to create among the English speaking peoples and the latter among the Spanish speaking peoples a relationship of cultural reciprocity and

mutual sympathy. In comparison with the types of pan-movements previously considered both Anglo-Saxonism and pan-Hispanism are vaguely defined, although some enthusiastic advocates of pan-Hispanism have gone so far as to discuss the restoration of the old Spanish colonial empire upon a democratic basis, and certain statesmen in England and America have raised their voices in favor of a definite political understanding between the two countries. But such plans are relatively insignificant, since they are unable to draw sustenance from any common national aspirations or even from any consistent tendency toward a united political and diplomatic policy. The persistence in some quarters of the traditional animosities engendered by the wars in which the colonies emancipated themselves from the mother countries further retards the progress of the movements, as does the heterogeneous racial composition of the American nations. Nevertheless, identity of language together with the English common law and the vast body of English traditions which America has inherited from the colonial period is likely to prove a powerful bond in the relations between the United States and Great Britain. To deny that a common tongue used as the medium not only of social intercourse but of literature and science tends toward a certain solidarity of outlook would be no less unrealistic than to consider it an infallible safeguard against misunderstanding.

The history of pan-Hispanism illustrates even more pointedly than that of Anglo-Saxonism the essential nature of this type of pan-movement. Although its origins may be traced back to the nineteenth century, the phenomenon first began to gather force immediately after the withdrawal of Spain from effective political influence in the western hemisphere, that is, after the Spanish American War; thus it is possible to interpret the desire on the part of the Latin American states for a cultural rapprochement with the mother country as a direct outgrowth of the diminution of the threat of Spanish political interference. At the same time it is a reaction against the strengthening of the position of the United States. Various attempts have been made by protagonists of pan-Hispanism to effect a closer cooperation in the pursuit of common interests; among these may be mentioned the Spanish American trade conferences and exhibitions held in 1923 and 1929 and the propaganda for economic reciprocity emanating from such pan-Hispanic associations

as the Unión Ibero-Americana. From the economic point of view, however, pan-Hispanism remains and is likely to remain relatively trivial. Far more important are the visits of Spanish authors and academicians to South America, the exchange of literature, the tightening of relations between the South American and the Spanish press, the efforts of Spanish Americans to revise the historiography of the colonial period and to puncture the *leyenda negra* and in general the substitution of Spain for France as the gateway to European culture. Since the republicanization of Spain in 1931 a still firmer affinity and sympathy have existed between the mother country and the Spanish American republics.

Other movements closely akin to Anglo-Saxonism and pan-Hispanism include pan-Lusitanism, which aims at the solidarity of the Portuguese speaking peoples; the Great Netherlands movement; and the *Norden* movement, or Scandinavian Unity, consisting of Norway, Sweden and Denmark, with Iceland and Finland admitted for certain purposes. Of these the last named appears to have the most secure foundations, since the three nations principally concerned are geographically contiguous and racially and culturally homogeneous. Conferences attended by members of parliaments, government officials and the kings of the Scandinavian countries have been held at intervals since 1903; in 1919 societies were formed in each country aiming "to deepen the sense of fellowship among the nations of the North, to extend their line of intellectual and economic contact, and to promote practical cooperation among them." But nationalism has kept the actual field of cooperation narrowly restricted. Pan-Latinism, the tenuous racial movement which may be considered the southern counterpart of the Scandinavian Unity, displays still less *élan*, for it involves three nations, Spain, France and Italy, which are divided by historical traditions, ambitions and political organization. If the Unión Latino-Americana, however, may be considered as one aspect of pan-Latinism, the latter has had considerable influence in the western hemisphere.

Pan-movements based upon the ideal of promoting the solidarity of all the adherents of a particular religious faith have only indirect importance in the political and social domain. Sometimes they serve to counteract national or pan-national movements, sometimes, by deepening the consciousness of common traditions,

to reenforce them. Thus pan-Islamism: (*q.v.*) was used at the end of the nineteenth century to strengthen the position of the Ottoman sultans both against European aggression and within the Islamic world; imbued with a democratic and nationalistic tinge and further altered by the shifting of its focal point to the Arabian race as the matrix of Islamism, it has come to constitute today, in so far as it still exists, a prop for pan-Arabism. Within Christianity the best organized pan-movement is pan-Anglicanism, which represents in some respects the religious counterpart of Anglo-Saxonism; it has found expression through the Lambeth conferences, which have been held periodically since 1867 and which led to the convocation of the Pan-Anglican Congress in 1908 in London. In an effort to strengthen the solidarity of the Anglo-Saxon world the conferences have gone so far as to attempt to effect a union between the Anglican churches and the non-Episcopal, or free, churches. Since 1920, when the Lambeth Conference issued an *Appeal to All Christian People* and formed a compact with foreign, especially the eastern, churches, pan-Anglicanism has been a force in the international world; not infrequently parallels may be traced between the overtures of the Church of England to the eastern churches and the imperial policy of Great Britain in the East. A tendency toward a broader pan-Christian movement has been vaguely manifested, for instance, by the Universal Christian Conference on Life and Work held in Stockholm in 1925 and the International Missionary Council, which met at Jerusalem in 1928 for the purpose of promoting Christian unity and "justice in international and inter-racial relations." While these movements indicate that religious leaders are conscious of the growing tendency to seek in wider unity a remedy for the ills resulting from the forces of nationalism, it is debatable how far they can gather momentum in the face of those forces. Moreover the Roman Catholic church, the branch of Christianity which has most stoutly withstood the disruptive effects of nationalism, has been restrained by its traditions of exclusiveness and uniqueness from participating in the recent pan-Christian developments.

From the foregoing survey it has become obvious that when an independent and established state participates in a pan-national movement for the ostensible purpose of assisting weaker co-ethnic groups in the improvement of their position, the intentions of the former are

likely to be diverted to imperialistic aggrandizement at the expense of the latter. An analogous tendency prevails in pan-movements having a merely regional rather than a racial or cultural basis—in the great pan-continental movements. From the point of view of realistic politics the smaller nations involved in such a movement are likely to waver between distrust of their more powerful neighbors and a desire to participate in the benefits of intercontinental solidarity; while the larger nations, even if innocent of actual expansionist ambitions, are at least tempted to demand the position and perquisites of leadership. Genuine pan-continentalism is confined to the western hemisphere, Europe and Asia. Pan-Asianism, in the form, for instance, of proposals for a federation of the yellow race, sometimes tends to assume the aspect of a racial movement; it belongs, however, properly in the category of pan-continentalism, since it embraces a number of definite national states and in its widest sense includes members of the non-Mongolian races. On the other hand, pan-Africanism, although its motive force resembles that of pan-Asianism, is a purely racial movement; while pan-Australianism, which achieved its objective in 1901 when the six states of the Australian continent became united into the Commonwealth of Australia, was more germane to national movements.

Pan-Americanism (*q.v.*), older and more highly organized than pan-Europeanism or pan-Asianism, has been sponsored chiefly by the United States, which convened the first Pan-American Conference in 1889. Latin America, however, distrusting the Monroe Doctrine and accusing the United States of using it to justify arbitrary intervention in Latin American affairs and to facilitate "dollar diplomacy," was quick to interpret pan-Americanism as a manifestation of the imperialistic ambitions of the United States. For this reason the pan-American conferences have failed to reach an accord in the really important political questions affecting the western hemisphere. In opposition to pan-Americanism certain South American intellectuals founded the Unión Latino-Americana; its purpose has been to develop a cultural and economic unity and to organize resistance to the Latin American governments on the ground that the latter are under the control of the United States and have mortgaged the independence of the South and Central American peoples by foreign loans and capital investments. From this point of view the Unión Latino-

Americana may be considered akin to the pan Asiatic movement, a part of the world wide effort for the political and economic emancipation of colonial and semi-colonial peoples.

Pan-Europeanism as an idea may be traced back to mediaeval Christianity. It became re-incarnated in Napoleon, who made an inspired but futile attempt to "create a great federative system in Europe which we consider in conformity with the spirit of the century and favorable for the progress of civilisation." As an emanation of the French Revolution the new civilization spread by Napoleon in reality contributed to the awakening of a hitherto unknown national consciousness on the part of the masses and so operated as a force inimical to pan-Europeanism. After the World War pan-Europeanism was revived, sponsored by some groups as a means of promoting peace, by others as a weapon to be used in the interests of continental states against the larger and more powerful oceanic empires. In the proclamations of French statesmen pan-Europeanism usually signified a Europe pacified on the basis of the peace treaties of 1919, with France as the leading state and with the League of Nations as guarantor of this order; German nationalists countered by delineating a European solidarity under German leadership. For a period of some years vigorous propaganda issued from a private pan-European union created by the Austrian count Richard Coudenhove-Kalergi, who proposed that European continental states conclude treaties providing for compulsory arbitration of disputes, form a European *Zollverein* to improve their chances in economic competition with the United States and other empires enjoying rich natural resources and, after a transitional period, ultimately establish the United States of Europe. Although excluding Great Britain, the center of a world empire, from actual membership, the federation as envisaged by Coudenhove-Kalergi would act in close cooperation with it; while on the other hand Soviet Russia, also barred on the pretext that it is a Eurasian rather than European country, would be viewed as a hostile power.

Pan-Asianism is neither a political reality nor an organized movement but a vague sentiment, which has become significant chiefly since the World War, that the Asiatic races and nations have a common destiny and a common cause against the white race. Like pan-Africanism it is still an essentially negative protest against the color bar and against economic exploitation by

western peoples. Despite the brevity of its existence, the territorial vastness of Asia, the diversity of cultures and the medley of cross currents pan-Asianism is an undeniably dynamic force, promoted by the leaders of all oriental nations, including Egypt as well as Asiatic nations and other Islamic countries; it derives sustenance also from the Soviet Union, which in 1920 organized at Baku a Congress of Oriental Nations. While some of the most forceful proponents of pan-Asianism have been Chinese and Hindus, it was principally through the influence of Japanese that the first Pan-Asiatic Conference was held at Nagasaki in 1926 under the auspices of the Pan-Asiatic Society. The conference failed to produce appreciable practical results but it discussed plans for closer economic cooperation among the Asiatic states and for setting up a permanent bureau in Tokyo, Peking or Shanghai. A second Pan-Asiatic Conference was held near Shanghai in 1928. Recent disputes between China and Japan have retarded the progress of pan-Asianism. Its future prospects seem to depend to a large extent upon the continued pressure of European and North American imperialism and of racial discrimination, which will provide a motive impelling the eastern peoples to stress the similarity of their economic problems and cultures and to minimize the differences.

The pan-continental movements are still too young to permit any definitive interpretation of their significance. Whether they represent pretexts for imperialistic aggression or practical proposals advanced to meet the momentary necessity for joint action against foreign powers or whether in a broader sense they indicate a trend away from the chaos of particularistic nationalism in the direction of a world federation, is at present an insoluble question. Certainly neither pan-Asianism nor pan-Europeanism as formulated today may be regarded as a force making for pacifism. The gospel of the former incites the masses to revolt against the fetters which consign them to inequality and jeopardize their chances for progress. The pan-Europe of Coudenhove-Kalergi is not only opposed to the Soviet Union but nourishes the germs of other large scale wars, because it would retain in the hands of the federation all the European colonies in Africa and Asia and so aim to perpetuate the present regime of imperialistic exploitation. But irrespective of present formulations pan-continentalism as an idea may be considered a timorous move to overcome the

anarchy of nationalism and to erect a political organization more harmonious with the realities of economic, intellectual and social interdependence among all branches of the human race. Thus it is dimly related to the ultimate panideal of world unity which alone can provide a secure foundation for world peace. Pan-national movements, on the other hand, serving to strengthen nationalistic sentiment and to heighten the consciousness of traditional uniqueness, operate like all national movements to hamper the progress of peace. There can be no doubt about the fact that national and pan-national movements are much more firmly rooted in the emotional and intellectual structure of present day society than are the broader pan-movements or a seemingly far off ideal of a common fellowship in the universal human society. As Julien Benda has shown in his *Discours à la nation européenne* (Paris 1933), an intellectual and emotional transformation must precede the development of a well founded pan-movement capable of reasserting, in a new orientation, the fundamental presuppositions of the old prenationalistic universalism and of depriving nationalism of the emotional emphasis it has had during the last two hundred years. Those nineteenth and twentieth century pan-movements which, whatever their tangible results, have attempted to bridge the barriers arising from racial or linguistic diversity may be viewed as typical phenomena of the transitional period.

PANAMA CANAL. Discussion of an isthmian canal, which dated from the period of discovery, became keener in the middle years of the nineteenth century because of the rivalries of Great Britain and the United States in Central America and an awakening American interest in the far west. In the Clayton-Bulwer Treaty of 1850 Great Britain and the United States undertook to expedite isthmian canal construction. This convention provided that any canal built should be open on equal terms to citizens of both countries as well as to those of such other powers as subscribed to the principles of the treaty; also neither party was to obtain exclusive control over the canal or erect or maintain any fortifications commanding either it or its vicinity.

The treaty, however, blocked canal building under government auspices for half a century. Because it had become increasingly unpopular in the United States and because British opinion had shifted to favor construction even under non-British authority, providing the canal was kept open on equal terms, negotiations between the two countries were reopened in 1899 and resulted in the writing of the Hay-Pauncefote Treaty in 1901. By this new understanding, which incidentally superseded the Clayton-Bulwer Treaty, a canal could be constructed under the auspices of the American government. The United States was to enjoy all rights incident to such construction, the treaty, however, providing for the canal's neutrality and for equality as regards treatment accorded and traffic charges imposed on the ships of all nations. The treaty, although it did not say so directly, was understood to permit American fortification of the canal.

In the period falling between these two conventions attempts to develop communications had been made by private groups. A railroad crossing the isthmus from sea to sea at Panama was constructed by an American company during 1850-55; also projects for the building of canals in Panama and Nicaragua were launched. Thus in 1878 a French syndicate secured a concession for a Panama canal from Colombia; four years later the company, now headed by Ferdinand de Lesseps, the builder of the Suez Canal, began digging operations and continued the work until 1889. But financial mismanagement and corruption as well as a failure to recognize clearly the nature of the engineering difficulties forced the company into bankruptcy. Following reorganization operations were resumed in 1894; and while work, particularly the gathering of scientific and engineering data, went ahead at a fair rate of speed, the chief intention of this New Panama Canal Company was to keep the concession alive in the hope that its rights might sooner or later be sold to the United States. Less substantial progress was made in Nicaragua by the Maritime Canal Company, an American group, which commenced activities in 1890 but was forced to discontinue in 1893 because of financial reverses.

The interest of the American government in isthmian canal routes antedated the appearance of private parties. A treaty effected in 1846 with New Granada, as Colombia was then called, guaranteed that to American citizens and their vessels and goods all means of communication

across the Isthmus of Panama were to be "open and free." The United States in turn promised "positively and efficaciously, to New Granada, . . . the perfect neutrality of the . . . isthmus, with the view that the free transit from the one to the other sea may not be interrupted or embarrassed . . . while this treaty exists; and . . . the rights of sovereignty and property which New Granada has and possesses over the said territory" (art. 35).

With the earlier limitations on action removed by the Hay-Pauncefote Treaty the United States developed its plans. Surveys in Nicaragua and Panama led originally to the recommendation of the former route; but when in 1902 the New Panama Canal Company indicated its willingness to sell its rights and properties for \$40,000,000, the Isthmian Canal Commission, which had supervised the chief studies, presented a second report favoring the Panama route. A congressional enactment authorized the president to buy out the Panama canal company and obtain from Colombia perpetual control over a canal zone; if these negotiations failed the Nicaragua canal project was to be pushed.

Accordingly in January, 1903, the Hay-Herrán convention between the United States and Colombia was signed. This authorized the transfer of the French company's rights and properties to the United States and gave the latter a renewable ninety-nine-year lease on a canal zone three miles on each side of the cut. Colombia was to continue sovereign over the strip and to use the canal for its public ships without charge; also it was to receive a cash payment of \$10,000,000 and an annuity of \$250,000 beginning nine years after the date of ratification. The American Senate promptly consented to the ratification of the convention; not so, however, the Colombian Congress. This body, largely on the grounds that Colombian sovereignty over the canal zone was not plainly indicated, that Colombia was prohibited from negotiating with the New Panama Canal Company for compensation for the privilege of transfer and that the American payments were inadequate, finally refused to ratify and adjourned on October 31, 1903.

If the United States turned to the Nicaraguan route, the route through Panama would lose commercial importance and the rights and properties of the French company would be practically worthless. Both the local population in Panama and the French company felt that the action of the Colombian Congress imperiled

their interests; indeed threats of revolution by Panamanians had been made while the Congress was still in session. The Colombian government, sensing the probability of an outbreak, decided to send troops to forestall it; the United States government, in its turn, dispatched naval vessels to Panama to protect American interests and to maintain "free and uninterrupted transit" across the isthmus. A bloodless "revolution" came promptly on November 3, 1903.

The attitude of the United States toward the uprising and the relations which American authorities, especially President Roosevelt, had thereto are highly controverted subjects. It may be plausibly argued that the guaranty of sovereignty in the treaty between Colombia and the United States was a guaranty against occupation by a foreign state but not one against a division of sovereignty through civil war. The truth of Theodore Roosevelt's later declaration that no one connected with the United States government "had any part in preparing, inciting, or encouraging" the revolt has not been disproved.

On the other hand, orders were sent to American naval forces on November 2 to stop the "landing of any armed force, either Government or insurgent, with hostile intent. . . ." This prevented Colombia from trying to re-establish its authority, and the prompt *de jure* recognition of Panama on November 13, followed by the Hay-Bunau-Varilla Treaty signed between the United States and Panama on November 18, made later assertion of such authority impossible. Whether or not the action of the United States was ethically correct, the later declarations of Roosevelt that he "took" the Canal Zone and that doing so was justified because the United States held "a mandate from civilization" prejudiced opinion as to the propriety of the course pursued.

The Hay-Bunau-Varilla convention followed the general lines of the Hay-Herrán proposal. Panama granted in perpetuity to the United States a strip of land extending five miles on each side of the canal, with the same rights therein as if it were sovereign. On the other side, Panama's independence was guaranteed and it was promised an immediate payment of \$10,000,000 plus an annuity of \$250,000 beginning nine years after ratification of the convention.

American occupation of the zone began May 4, 1904. A lock canal, as against a sea level waterway, was decided upon, and construction was begun intensively in 1907 by the United States Army Corps of Engineers with Colonel

G. W. Goethals in charge. Slides from the hills through which the channel was cut were an engineering problem of serious nature both before and after its completion. The canal was opened to commerce on August 15, 1914. Meanwhile sanitary work, under the supervision of Colonel W. C. Gorgas and conducted especially against yellow fever and malaria, made the Canal Zone one of the most healthful of tropical areas. Powerful fortifications for defense were also erected.

The cost of the canal to the end of the period of construction and development, on December 31, 1921, totaled \$355,734,673, of which \$101,294,309 represented capital expenditures for defense and \$254,440,364 represented canal transit and canal business properties. The total capital investment in canal works, exclusive of fortifications, military posts, submarine bases and similar items, on June 30, 1932, was \$533,106,009. This figure includes an interest charge at 3 percent on moneys used for building purposes during the period of construction. For the subsequent period interest at 3 percent on the investment has been charged to operating expenses; the same is true of depreciation.

Before the completion of the waterway the question of tolls to be charged became an international issue. Under the Hay-Pauncefote Treaty the canal was to be "free and open," "on terms of entire equality" and with "no discrimination" against any nation as to "conditions or charges of traffic, or otherwise." In 1912, however, Congress, in legislating for the governance of the Canal Zone, provided for the exemption of American coastwise vessels from tolls. Great Britain protested that such action violated the treaty and later this contention was supported by President Wilson. In 1914 before the canal was opened the contested exemption was repealed, the question whether it did in fact violate the treaty being, however, reserved.

The government of the Canal Zone, provided for under the Panama Canal Act of August 24, 1912, is substantially that of a military reservation with authority vested in a governor. It is interesting to observe that many disputes have arisen between Panama and the United States as to the extent of the rights of the latter in the zone. These involve such questions as competition of United States commissaries with business interests in the republic, consular rights and ownership in certain properties of the Panama Railroad, lands in Colon and lands necessary for the efficient operation of the water-

way. A treaty of 1926 to settle the controversies was still unratified seven years later.

American action on the isthmus aroused criticism among the Latin American republics. The purpose of building a canal was applauded by the second Pan-American Congress at Mexico city in 1902, where it was declared that the canal would be "in the highest sense a work of civilization." But the role played by Roosevelt in the Panama revolution caused apprehension, as did also the subsequent development of plans to strengthen the international position of the United States. In recent years this feeling has been somewhat modified because of the fact that United States policy has become less forward and adjustments of individual grievances have been arranged.

The most important of these was the settlement of the controversy, dating from the Panama revolution, between Colombia and the United States. Repeated negotiations, begun only to be broken off, finally resulted in 1914 in the writing of a treaty under which the United States was to pay Colombia \$25,000,000 and allow her citizens special favors in the use of the canal; also the treaty expressed regret for the events that had interrupted the cordial relations between the republics. Colombia was to recognize Panama's independence. But the friends of Theodore Roosevelt, regarding the treaty as an attack on his personal integrity, opposed its consideration, so that the document was not reported from the Senate Committee on Foreign Relations until March, 1917; even then the minority report openly stigmatized the payment of \$25,000,000 as a "blackmail demand." The entry of the United States into the World War postponed the matter; in 1921, with Roosevelt dead, cooler counsels prevailing and the presence of oil in Colombia a not unimportant factor, the Senate consented to the ratification of the treaty. The apology clause was, however, left out.

Naval advantages to the United States were one of the chief motives for building the canal. A fleet which can be shifted from one coast to the other is doubled in availability; hence the canal has become a major factor in American policy. The continued desire of the United States to put itself in a strong strategic position has been revealed by its interest in the petroleum regions in the Caribbean, by treaties concerning naval bases and by the arrangements made with Nicaragua in 1916 and Colombia in 1928 for the use of outlying Caribbean islands. The development of airplanes capable of sustained flights has

emphasized the conviction that defense requires control of more than the nearer approaches of the waterway.

The economic advantages rising from the canal less markedly favor a single country. Ocean routes between great commercial centers have been shortened by the canal. Vessels sailing from New York to San Francisco by the Strait of Magellan travel 13,135 nautical miles and by the canal 5262 miles, making a saving of 7873 miles. The route to Callao is shortened 6250 miles; to Yokohama 3359 miles are saved if the Panama Canal is used instead of the Suez Canal. From Liverpool to San Francisco the saving is 5666 miles. North America stands out as the primary region served. In the fiscal year ended June 30, 1932, about 80 percent of the Atlantic to Pacific cargo originated on the east coast of North America; of the trade in the opposite direction 68 percent came from the North American west coast. Over one third of the cargo passing through the canal was in the intercoastal trade of the United States. This trade through the canal has raised the fear that transcontinental railroads may have to face destructive competition, but opinions differ as to what has been its real influence. Undoubtedly the canal has increased intercoastal water borne traffic and has forced downward certain rail rates. On the other hand, the less costly service created has opened up export markets which formerly could not be reached by American producers and has enabled industries to secure foreign raw materials more cheaply; this process has contributed to rail shipments.

Canal traffic grew slowly to total 11,599,214 tons of cargo in the fiscal year ended June 30, 1921. The peak was reached in 1928-29 with 30,663,006 tons but declined to 19,807,998 tons in 1931-32. Slightly less than half of the cargo passing through the canal in recent years is under the American flag, while about one fourth is under the British. In 1931-32 the proportion of the cargo which passed from the Atlantic to the Pacific was 28.4 percent and from the Pacific to the Atlantic 71.6 percent. The number of commercial vessels using the canal in 1914-15 was 1075. This number reached its highest point in 1927-28 with 6456 and dropped to 4506 in 1931-32. The highest average daily transit was 17.6 vessels in 1927-28; it was 12.3 in 1931-32. The operation account of the canal, including depreciation charges but excluding interest on investment, has shown a surplus each year since 1921. The total net revenues during

1914-32 were \$160,888,376. But if interest on the capital account, at 3 percent, is included, there was a deficit at the end of the period 1922-32 of \$13,261,695.

Interruptions of traffic due to slides, the problems of flood control and water supply and the increase of traffic during prosperous years have raised questions as to the adequacy of the waterway. Theoretically 48 vessels per day can be locked through; but peak traffic is about 50 percent above average. The addition of a third set of locks at an estimated cost of \$140,000,000 would give an actual lockage capacity of 48 per day. Estimates of traffic increase indicate, however, that present capacity, namely, without the third set of locks, will suffice for about forty years.

This question of the adequacy of the Panama Canal has renewed interest in the Nicaragua route. The Bryan-Chamorro Treaty of 1916 granted the United States in perpetuity exclusive proprietary rights for the construction and operation of an interoceanic canal in Nicaragua as well as a ninety-nine-year lease, with option to renew, of Great Corn and Little Corn islands in the Caribbean and the right to establish for a similar period a naval base on the Gulf of Fonseca. Costa Rica, Salvador and Honduras protested that this treaty infringed their rights; a protocol of 1923, however, which by 1933 was still unratified but which Costa Rica apparently regarded as a definite promise, gave assurance that the United States would not construct a canal without negotiating for the satisfaction of Costa Rican rights.

An Interoceanic Canal Board, appointed in 1929, reported in 1931 that a Nicaraguan canal was feasible at an estimated cost of \$722,000,000, including cost of defense. In its favor it was pointed out that such a canal would shorten sailing distances for about two thirds of the traffic now using the Panama Canal, would contribute to the national security and would help stabilize Central America. But it was generally felt in the United States that immediate steps looking toward construction were inadvisable because of the great cost of a second waterway and because of the ability of the Panama Canal, with its present plant, to handle traffic for a long time to come.

PANKHURST, EMMELINE GOULDEN (1858-1928), English suffrage reformer. Mrs. Pankhurst was a dauntless agent in bringing to its climax the democratic trend which involved four generations of the English people. The influences of her early years did much to create her social consciousness: her grandfather had barely escaped with his life from the manhood suffrage meeting which ended so disastrously with the "Peterloo Massacre" of 1819; her father, a calico printer of Manchester, stood unequivocally for abolition of slavery when the American Civil War forced the issue in England in the 1860's; she was deeply affected as a child by the execution in Manchester of men who sympathized with the Fenians of Ireland seeking self-government. Later at school in Paris she

came into contact with French revolt through her friendship for Mlle. Rochefort. After her return to England she served as apprentice to her mother in the work of promoting the cause of woman suffrage. Her marriage to Dr. Pankhurst drew her into the Socialist agitation and she joined the Independent Labour party, brilliantly supporting Keir Hardie in the demand for free speech on this issue. Practical experience with politics as a poor law guardian and Trades Council nominee on the School Board of Manchester made her approach to public questions factual as well as theoretical. When her daughter Christabel launched a militant campaign against the opponents of woman suffrage, the mother cast in her lot with tacticians of the intransigent school. Tradition, observation, public work and reading convinced Mrs. Pankhurst, despite the popular notion that England has been the home of compromise, that eternal vigilance and a willingness to face danger and bear suffering were the roads to democracy. She used the appeal to reason when she thought it might suffice but, fragile though she was, she waged nine years of militancy when that seemed the last resort. Time and again under the provisions of the Cat and Mouse Act, passed in 1913, she was arrested and often forcibly fed when she undertook the hunger strike in protest against the refusal of her guardians to recognize her as a political prisoner. Only when the World War seemed to command a greater allegiance did she turn aside from the woman movement to the national movement. The enfranchisement of women was achieved in 1918 and by the time of her death, ten years later, Mrs. Pankhurst was herself a candidate for Parliament, as a Tory.

PANTALEONI, MAFFEO (1857-1924), Italian economist. Pantaleoni studied in Germany and took his degree in law at the University of Rome. At the age of twenty-five he was appointed professor of economics at the University of Camerino and taught at the schools of commerce in Venice, in Bari and at the University of Naples. After having incurred the wrath of the government authorities because of his criticism of the Italian policy in the African war

Pantaleoni relinquished his post in Naples and went to the University of Geneva, where he lectured for three years. In 1900 he returned to Italy to assume professorship at the University of Pavia, and two years later he succeeded Messedaglia in the chair of economics at the University of Rome. In 1900 he was elected to the Parliament, where he attained considerable distinction. He retired from active politics after a few years but reentered the political arena after the World War, when he acted for a time as d'Annunzio's director of finance in Fiume. He represented the Italian government at the League of Nations Committee of Control for Austria in 1923 and in the same year was appointed senator.

Pantaleoni was a man of broad culture and immense erudition. He was a fascinating teacher and it was largely because of his influence that Pareto, an engineer, and Barone, a staff officer, were attracted to the study of economics. His interests covered almost the entire range of pure and applied economics, and he wrote brilliantly on many topics on the border line between economics and sociology. His main contributions, however, were in the fields of economic theory, public finance and statistics. His chief work was in economic theory, *Principi di economia pura* (Florence 1889, 2nd ed. 1894; tr. by T. B. Bruce, London 1898); here he analyzed in a masterful fashion the theory of marginal utility and attempted to demonstrate that in a regime of free competition marginal utility coincides with marginal subjective costs. He succeeded with great ingenuity in translating in terms of costs the theorems on exchange which he had first expressed in terms of final degree of utility. The book marked a turning point in the history of economics, at least in Italy.

In public finance Pantaleoni is credited with having initiated the revival of interest in fiscal problems which characterized Italian economic literature toward the end of the century. His own works include *Teoria della traslazione dei tributi* (Rome 1882), which still remains the best treatment of the theory of the incidence of taxation; "Considerazioni sulle proprietà di un sistema di prezzi politici" (in *Giornale degli economisti*, vol. xlii, 1911, p. 9-29 and 114-38), in which he demonstrated the usefulness of the concept of political prices—that is, prices charged for the services of government owned utilities—as distinguished from that of economic prices; and "Lo stato azionista e il monopolio

dell'emigrazione" (in *La vita italiana*, vol. vii, 1916, p. 111-20), in which despite his staunch opposition to state intervention in economic affairs he supported the view that the state should participate in the profits of private enterprise by receiving stock from certain navigation companies in return for monopoly privileges granted to them.

In the field of statistical research Pantaleoni did pioneer work in several directions. His *Dell'ammontare probabile della ricchezza privata in Italia* (Rome 1884) presents a valuable estimate of the probable national wealth of Italy and a still more valuable analysis of the method of arriving at his estimate. He is to be credited with having elaborated the theory and technique of index numbers. Finally, in reporting on the case of the Frenchman Arbel, who pleaded inability to fulfil the terms of a contract with the Italian government because of an intervening crisis in the iron industry, Pantaleoni developed a theory of industrial fluctuations in which he anticipated some of the results attained by the Harvard Committee on Economic Research; the essential part of the report, which had originally been published but withheld from circulation, was reprinted as "La crisi del 1905-07" in *Annali di economia* (vol. i, 1924-25, p. 301-542).

PANTHEISM. *See* RELIGION.

PAPACY. The origins of papal jurisdiction and prerogatives are to be sought in the transformation undergone by the primitive Christian

church during the first few centuries of its history. With the disappearance of the predominantly charismatic leadership of the early church communities, direction of the local congregation passed gradually from the college of presbyters to a single bishop. By the third century this institutional transformation had been rationalized in the form of a theory of apostolic succession, which ascribed to each bishopric an unbroken line of descent from the original group of apostles. But in the light of the growing conflict of jurisdiction between the incumbents of the various sees it became apparent that the presupposition of equality as between the apostles did not serve to allay immediate rivalries over episcopal rank and power, and around the middle of the third century a new emphasis was given the apostolic theory in the course of the epoch making controversy between Stephen, bishop of Rome, and Cyprian, bishop of Carthage, over the correct interpretation of the *tu es Petrus* text in *Matthew* XVI: 18, 19. Fully cognizant of the prestige which accrued to Rome not only from its traditional role as imperial city but also from its pioneer work in systematizing the dogma and canon of the Christian church, Stephen invoked the authority of Matthew as evidence of the primacy of Peter among the apostles and even suggested the more immediate implication of the text as Scriptural sanction for the primacy of Peter's successor over the other branches of the apostolic line. From a more tangible administrative angle the Edict of Milan (313), by assimilating the church into the institutional apparatus of the empire, bolstered still further the position of the bishop of Rome and gave greater weight to his assumption of primacy. Within the Western church the office of Roman bishop extended its jurisdiction as a court of final appeal; and throughout the fifth century, with growing acquiescence in the universalistic claims of the Roman bishopric, rival jurisdictions were invaded in matters of both church discipline and dogma.

The *de facto* primacy of Rome received its first fully rounded and systematic articulation in the classic exposition of the Petrine theory by Leo the Great (440-61), who, drawing out to the full the implications of Stephen's earlier speculations, welded together the implicitly centralistic claims of the Roman bishops and the theory of the apostolic succession, hitherto predominantly federalistic in its emphasis. Primacy of honor as well as primacy of jurisdiction was declared to

inhere in the Holy See, established by "the Prince of the Apostles" and bequeathed directly to his legitimate successors, the bishops of Rome. Moreover the theory that each and every member of the Christian church was entitled to appeal directly to Rome strengthened still further the jurisdiction of the central bishop, or pope; while the appointment of legates, primates and apostolic vicars to represent the pope in his relations with subordinate bishoprics served to introduce a more standardized regime of ecclesiastical discipline and doctrine.

During the period of institutional dislocation which intervened between the death of Leo the Great in 461 and the elevation of Gregory VII to the papacy in 1073 the heads of the Roman church succeeded but slightly in advancing their claims to universal jurisdiction and dominion. While the sway of Christianity was extended widely among the northern European peoples and a multitude of new churches were set up among the Britons, the Teutons and the Slavs, geographical isolation and imperfect communication precluded any adequate administrative supervision from Rome. Organized either on a local, a sectional or a quasi-state basis, the new churches were predominantly regionalistic in their outlook and loyalties, unaware in the main of a more far reaching allegiance. As a result the papal office remained essentially a central Italian or at best a peninsular institution, deriving its modest prestige and prerogatives chiefly from the effectiveness with which it had taken over from indifferent Byzantine emperors the task of defending the Western Empire against the invading armies from the north. Until the latter half of the eighth century the pope continued to be elected, like any other bishop, by the local clergy and congregation of the diocese of Rome; and even after popular participation in the election had dwindled to a mere formality, eligibility for the office was for a time narrowly restricted to priests or deacons of the leading churches in Rome.

The dependence of the popes during this transitional period on the favor and support of extra-ecclesiastical overlords, whether in the form of confirmation by the Byzantine or at a later date by the Germanic emperors, may be attributed, aside from the general disorder of the period, to the political and economic insecurity of the as yet imperfectly institutionalized papal office. The political quasi-sovereignty which accrued to the papacy in the course of the eighth century, and which varied in extent and effec-

tiveness according to the broader political and military situation prevailing at the moment, was restricted in the main to the duchy of Rome and the exarchate of Ravenna. The alliance with the Carolingian emperors brought about a temporary consolidation of papal dominion in Italy; but with the intensive process of feudalization which began in the ninth century the political power of the popes crumbled rapidly, especially in the outlying areas beyond Tuscany and the Apennines, reaching its lowest ebb in the tenth century. The actual landed estates of the papacy—the Patrimony of St. Peter—attained impressive proportions under Gregory I and even afterward continued to yield varying degrees of return, whether in the form of direct produce from the land or of rent from tenants. But following the widespread confiscations of Emperor Leo III in Sicily in the eighth century this patrimony began to dwindle sharply, and in the ninth and tenth it passed in larger and larger sections into the hands of Roman feudal cliques, who by the middle of the tenth century had secured control of the papal office. The increasing power of the Holy Roman emperors after Otto I, while breaking the hold of the Roman nobility, threatened to reduce the status of the pope to headship of a German state church.

The reaction against the prevailing degradation and secularization of the church found its first expression in the newer churches to the north, but with the elevation (1048) to the papal office of Leo IX, a zealous apostle of the Cluniac reforms, the papacy entered upon a decisive period of regeneration, which was ultimately to augment its powers, institutional no less than spiritual. The full potentialities of the reform movement first became manifest when Gregory VII (pope 1073–85) took over its leadership and by his energetic policy during the investiture conflict (*q.v.*) sustained the pontifical right to compel regeneration by subjecting local churches and church dignitaries to the jurisdiction of the Holy See. The movement toward centralization thus inaugurated continued, with occasional interruptions, until it reached its climax in the fourteenth century. Resurrecting the moribund office of legate and fortifying its incumbents with a wide discretionary authority to execute his will in the localities, the pope extended his lawmaking powers by holding under his personal presidency regular synods at Rome and claiming for their pronouncements the finality of conciliar decrees. The prerogatives of the bishops and metropolitans were further

diminished by the systematic transfer of judicial cases from local ecclesiastical courts to the Curia and by the practise, particularly common during the eleventh and twelfth centuries, of exempting from the control of the bishops those monasteries and great orders which agreed to acknowledge the papacy as their direct protector. One of the orders immediately responsible to the papacy, the Dominicans (founded 1216), became the chief administrator of the Inquisition, thus affording an additional instrument for the papal war upon the episcopate. In the course of the twelfth century the legal consolidation of papal claims was initiated and the theory of the universal validity of law emanating from the papacy began to emerge in the writings of canonists like Yves of Chartres and Gratian, who attributed to the pope an unlimited right to nullify any law through the medium of the dispensation. Of particular importance was the codification of canon law, begun under the inspiration of the papacy with the famous *Decretum* of Gratian and continued systematically by Innocent III and his successors. It was Innocent who definitely destroyed local autonomy: from his time on the election of a bishop was normally considered incomplete without papal confirmation, while the lower clergy also became for the most part dependent upon their superiors. Practically and theoretically, by the end of the thirteenth century the pope was accepted not only as the visible head of the church but also as its exclusive lawmaker, the incumbent of the plenitude of power.

It was at the same period and as the result of a process of development parallel to the centralization within the church that the claims of the papacy to direct temporal power received their most extreme formulations (for a comprehensive discussion of the relations between church and state, see RELIGIOUS INSTITUTIONS, section on ROMAN CATHOLIC). As the supreme sanctions of the pope excommunication and interdict, often involving an economic and social boycott, had proved to be far from impotent weapons when wielded against a refractory prince. While the pretensions of Boniface VIII (1294–1303) to absolute authority in the political sphere were too extravagant to win general acknowledgment, the prestige of the papacy as it emerged from the great contest with the empire in the thirteenth century was such as to confer upon it for a time a *de facto* hegemony in European political affairs. The complementary objective of preventing in so far as possible encroach-

ments by the political authorities and other laymen upon the internal autonomy of the church impelled the reforming papacy to introduce various rules of procedure, particularly as regards the nominations and behavior of ecclesiastical officials. Among these was the series of regulations for the first time authoritatively standardizing the mode of papal elections. By the bull of Nicholas II in 1059 the electorate was confined exclusively to the cardinal bishops and the ratification of the Roman clergy was made optional. As epitomized by Peter Damian, the authentic interpreter of the bull, the function of the cardinal bishops was to elect, that of the clergy to give *assensus*, that of the populace to bestow *applausus*; actually, however, the last two elements in the process progressively lost even their meager ceremonial significance. The Third Lateran Council of 1179 extended the body of electors to include the entire College of Cardinals and introduced the majority principle—then an innovation in electoral technique—in the canonical form of a two-thirds vote. Subsequent refinements of this procedure have been aimed solely at greater precision in order that opportunities for external pressure might be minimized. Thus the bull issued by Gregory X in 1274 prescribed that those cardinals present at the death of the pope should without previous consultation repair ten days thereafter to a conclave and there in strictest seclusion choose his successor. While these rules, together with the further restrictions making membership in the Sacred College a prerequisite for eligibility to the papal office, were never proof against evasion and subterfuge, they had an important part in buttressing the independence of the church.

The expense of supporting the expanding central institutions of church government and of maintaining the pope in the role of a European political figure led, beginning particularly with the thirteenth century, to the erection of a highly elaborate fiscal machine. By the eleventh century the shrinkage of the Patrimony of St. Peter had compelled the papacy to place its chief reliance on other sources of revenue, such as the census, a charge levied upon churches, monasteries, kings and lords under the special protection of the papacy and, in the form of Peter's pence, upon Poland, Hungary, England and the Scandinavian countries, which undoubtedly paid chiefly because they also were obligated to the Holy See as its particular protégés. But even when supplemented by the feudal dues paid to

the pope in increasing amounts during the twelfth century by the various European empires under his suzerainty, such more or less irregular sources of income soon proved wholly inadequate. The first definite sign of a methodical financial regime at Rome was the drafting of the *Liber censuum*, in which data relating to the census were collected and arranged in the proper legal form. But the urgent need was an expansion of the basis of taxation; the Curia therefore began systematically to lay the entire church under contribution for its maintenance. A first tentative step in this direction appears in the plan which was worked out in detail by Emperor Henry VI and which was subsequently revived by a group of prelates at the Fourth Lateran Council of 1215: namely, that one living in every metropolitan and episcopal district be permanently reserved for the support of the Curia. The second and more fundamental step was the development of a system of direct taxation. First introduced as an emergency measure for the purpose of carrying on the crusades, the papal taxes came to recur at quite regular intervals in the course of the thirteenth century, when they were commonly known as *decimae*, or tithes, since the usual levy amounted to 10 percent of the income from all the benefices and ecclesiastical property in a particular group of states or church provinces or perhaps within the entire church. Sometimes in addition a fixed subsidy was imposed on certain territories, but in any case it was the direct tax gathered by a competent staff of papal collectors and usually flowing to Rome through the medium of the Italian banking houses that constituted the indispensable element in curial finance down to the fourteenth century. During the same period the census gradually began to dwindle in importance, primarily because it was a fixed assessment which could not be increased in proportion to the rising value of gold.

Although the catastrophic reversal suffered by Boniface VIII in his controversy with Philip IV of France fatally punctured the temporal power of the church and led to the removal of the papacy to Avignon, where between 1305 and 1378 it remained within relatively close reach of the French king, there is every indication that the consolidation of papal monarchy continued at an undiminished pace. Particularly is this true in the sphere of fiscal centralization, which, in the policy of the Avignonesse papacy, was closely interwoven with the continued invasion of local liberties. In their now established right to bestow

confirmation on episcopal elections as well as in the practise of monastic exemptions the popes found a particularly convenient instrument for extending their right of provision to major benefices (i.e. bishoprics and abbeys); while the entering wedge for papal provision in the case of minor benefices (i.e. canonries, parishes and the like) might be an isolated nomination made by the pope in accordance with some special mandate or decretal *per preces*. An especially useful means of acquiring the provision of both types was the reservation, by which the papacy merely appropriated the right of provision to certain classes of benefices either throughout the entire church or in certain specified territories. While the first general reservation dates back to 1265, it was the Avignonese popes, and John XXII in particular, who most fully exploited the possibilities of this instrument and who in general most thoroughly transferred the collation of benefices to the Curia. The essential motivation in this extreme centralization seems to have been the fee, paid by the appointee for the papal confirmation or provision. This fee was called *servitium* when paid for the receipt of a major benefice and had originally been a gift; but by the end of the thirteenth century it had developed into a regular exaction proportionate to the rent value of the benefice. During the Avignonese period it was increased until it normally amounted to one third of the annual net income, while the analogous charge (termed annates or first fruits) for appointment to a smaller living was one half. The dues collected from the prelates on the occasion of their obligatory visits *ad limen* were similarly augmented. From the broader standpoint of the evolution of papal finance the emphasis placed by the Avignonese popes upon the receipt of fees is indicative of a systematic attempt to find a substitute for general taxation. Although not finally abandoned until many centuries later, the latter was already beginning to decline in its yield, partly because of the obsolete assessments upon which it was ordinarily based after 1300, partly because of the competition of the emerging national state, which grew envious of the taxable wealth of the church and retained a constantly increasing portion of the tithes for its own use. The fee system in its turn, encountering the hostility of the state and the disaffection of those required to pay, soon became unprofitable also. But before the final dénouement the papacy, through its policy of fiscal centralization, had converted a large portion of the ground rents of

Europe into liquid capital and, through its close association with the Italian bankers and money dealers, had made possible the diversion of this wealth into the channels of commerce, industry and finance. The papacy thus became one of the fundamental forces in the growth of primitive capitalism in Italy.

In addition to their achievements in the realm of finance John XXII and to a lesser extent the other Avignonese popes greatly elaborated the central administrative machinery of the papacy. Originally divided, in exact imitation of the Byzantine imperial court, into a *primicerius*, *secundicerius*, *schola notarum*, *arcarius* for the care of income and *sacclarius* for the supervision of expenditures, the papal Curia had evolved and changed in a rather haphazard fashion until in the thirteenth century its essential components were the College of Cardinals, with variable duties, and two permanent bureaus, known as the chancery and the chamber, or *Camera apostolica*, the latter serving in the double capacity of court of justice and central office for financial administration. Besides smoothing out the crudities and inefficiencies of the system and defining the precise sphere of each element in the structure, the Avignonese papacy definitely organized the Penitentiary to handle cases involving matters of conscience, perfected the use of legates as a medium of administration and centralized control and introduced a new collegial tribunal, which under the name of Rota later came to be used chiefly for trying appeals to the papacy. The tendency toward specialization of function and bureaucratic expansion continued almost of its own momentum: thus in the fifteenth century the chancery was divided into two separate offices, the *signatura iustitiae*, to receive petitions, and the *dataria*, which developed into the central bureau for dispensation and indulgences; and in the following century the *signatura gratiae* was created to take over some of the duties of the *signatura iustitiae*.

The first opposition to the progressive consolidation of papal monarchy was precipitated by the exaggerated fiscal centralization achieved by the Avignonese papacy; but once set in motion the reaction rapidly gathered up a wide variety of discontented factions and welded them into an attack upon the prerogatives of the papacy so thoroughgoing as to strike at the roots of the constitution of the church. Especially propitious for the gestation of antipapal forces was the Great Schism (1378-1417), during which there existed two parallel papal lines, one

at Avignon and one at Rome, with occasionally a third claimant in addition. Although the unity of the church ultimately survived the threat inherent in the Schism, the period entailed inevitably a profound relaxation in the activity of the central machinery and permitted regionalistic ecclesiastical movements to spring up and intrench themselves. In these circumstances the organization of the church began to reveal the full effects of the processes which since the thirteenth century had been converting Europe into a mosaic of national, territorial or city-states, and which, somewhat ironically, the papacy itself by its warfare against the Holy Roman Empire had served to accelerate. During the early years of the fifteenth century the territorial church, more or less subject to the will of the prince, which inevitably collided squarely with the fiscal and political policy of the papacy, attained permanent outlines. The primary objective of the prince was, in addition to the abolition of papal taxes, acquisition of control over ecclesiastical appointments and over the rich benefices, which were regarded as convenient means of compensating the members of the rapidly expanding royal bureaucracies. Such a program, although it presaged difficulties in adjustment once the common enemy should be destroyed, provided a natural basis for an alliance between the political power and the disaffected bishops, who united in the reaffirmation of the principles of local autonomy. As reflected in the conciliar movement this union inspired a fundamental challenge to the concept of papal monarchy.

Building upon a groundwork laid by their scattered fourteenth century forerunners, such as Marsilius of Padua and William of Ockham, who had reacted against the papal claims to plenitude of power within the church and to direct authority in temporal affairs, the conciliar theorists, led in the period around 1400 by Gerson, Gelnhausen, Langenstein and Zarabella and later by Nicholas of Cusa and Jüterbogk, restated and developed the doctrine of episcopatism. Along with the more familiar arguments for decentralization there appeared also in these formulations the novel element of popular sovereignty, reflecting the transfer of constitutional antagonisms from the political to the ecclesiastical sphere. Despite the failure of the councils of Constance and Basel to achieve permanent reform the idea of episcopatism, as epitomized in the formula that the unity of the church was represented by pope and general

council, long continued to be a dynamic force; while in the more tangible realm of ecclesiastical administration the various concordats negotiated between the papacy and the European states during the first half of the fifteenth century partially restored the lost prerogatives of the bishops by reviving their control over the patronage within their jurisdiction.

Entirely distinct from the regionalistic tendencies represented by the conciliar movement but ultimately chargeable also to the consequences of extreme centralization was the gradual curtailment of the pope's supremacy within the Curia itself. The cardinals of the Sacred College had early given unmistakable evidence of their intention to capitalize their indispensability in the central administrative bureaucracy and the prestige associated with their unique relation to the papacy as electoral body and exclusive élite of potential candidates. Even before 1300 they had established their permanent right to a share of the curial income—sometimes, as revealed by a bull of Nicholas IV in 1289, amounting to one half of the total. The enormous extension of their power as a result of the furtherance of administrative centralization during the Avignones period is most strikingly indicated by the introduction of a practise whereby the Sacred College exacted the assent of the papal candidate to a series of demands. Already familiar under the name of *Wahlkapitulation* in the process of nominating Holy Roman emperors, the electoral contract was first imposed upon the papacy in 1352 and after an interlude extending down to 1431 became virtually a regular part of the procedure of each successive conclave, attaining its most ambitious form in 1464 at the ascension of Paul II to the pontificate. At this point and in greater or less degree throughout much of the fifteenth century the papacy was in danger of becoming entirely divested of its former monocratic powers and reduced to presiding over an oligarchic council of cardinals. Not infrequently the oligarchy served as a medium for the expression of reform tendencies and as a salutary corrective to nepotism and the abuses associated with papal autocracy. But, interested no less than the papacy in perpetuating the system of bureaucratic centralization, the cardinals were often too profoundly engrossed in furthering their selfish and sometimes purely mercenary ends to devote much attention to the broader problems of curial policy. Control over papal appointments to the Sacred College, pensions for impecunious

cardinals, a share in the government of the Papal States and in the collation of benefices, are typical demands in the electoral contracts of the fifteenth century.

The continued refinement of curial mechanisms for exacting tribute and homage on a continental scale proved increasingly ineffective in the face of the realistic obstacles inherent in the consolidation of the various nation states to the north. As the jealous rivalry of the expanding temporal authority became buttressed by sectarian and, after the Reformation, by openly heretical groups of the population within the more outlying regions of Europe, the post-Schismatic and post-Reformation popes began to be impressed with the necessity of exploiting more effectively and systematically their territorial holdings and dominions in Italy itself. The magnificent gestures of the Renaissance papal Maecenases and the strenuous, if somewhat nostalgic, attempts of the sixteenth and seventeenth century popes to marshal under their leadership a united Christendom against the revived threat of the Crescent created a mounting demand for new sources of revenue. Sensing, in spite of the legalistic reaffirmations of papal supremacy by Torquemada and others, the underlying precariousness of its position, the Renaissance papacy, notably in the person of Julius II, set out to reconsolidate its immediate territorial domain, which except for sporadic revivals had tended to occupy a subordinate place in the papal system since the Europeanization of the papacy by Gregory VII centuries earlier, and which since 1300 had dwindled progressively as a result of encroachments by the rising city-states of central Italy and by rival factions during the Schism. By means of a series of costly wars throughout the peninsula, culminating in the capture of Ferrara in 1597 and Urbino in 1620, the papacy succeeded in restoring its Italian holdings and in setting up as its primary sphere of political sovereignty the Papal States.

During the succeeding two and a half centuries the Papal States remained, notwithstanding recurring invasions and occupations by military forces, not only the foundation of papal sovereignty in a political and diplomatic sense but also the chief source of papal revenue. Before accepting the disintegration of its mediaeval fiscal structure, which had shown unmistakable signs of inevitable collapse from 1400 on, the papacy had made a series of experiments, including the augmentation of chancery and com-

position fees and the more far famed sale of indulgences. But even during the fifteenth century this income had to be supplemented by substantial amounts accruing to the pope either from his actual territorial holdings, particularly in the period after 1460 from the alum mines of Tolfa, or from such fixed contributions, rent payments and monopolies as he was able to exact as political sovereign. During the sixteenth century, when the potentialities of the Papal States as a source of revenue were first fully realized, there was gradually introduced a radically new system of taxation predominantly indirect in its incidence. The tax on meat, first imposed in 1553 and steadily raised thereafter, and the tax on flour milling in 1643 were but two outstanding instances of a number of small fiscal monopolies and consumption taxes of all kinds. Direct taxation, on the other hand, was curtailed, being limited to a fixed impost known after 1544 as the *sussidio triennale*.

In the period after 1500, however, the really dynamic element in the building up of papal finance was long term credit, which tended to overshadow the earlier system of short term credit as typified in the transactions between the popes and the central Italian bankers of the thirteenth and fourteenth centuries and as revived intermittently in the post-Tridentine period, for example, by the popes of the seventeenth century in their dealings with the bankers of Genoa. Through the medium of the rapidly increasing associations of curial bureaucrats (*uffizi vacabili*) an interest bearing debt was built up in the form of annuities, which were serviced at first with the various fees and other contributions paid to the papal treasury and later also with customs duties collected by the Papal States. There followed in the sixteenth century the emission of a long series of loans beginning with the *monte fede* of 1526, a loan of 200,000 ducats at 10 percent interest. Usually in the form of annuities, either for life (*monti vacabili*) or for a term of years (*monti non vacabili*), these loans were divided into equal shares (*luoghi*) of one hundred ducats or scudi and serviced with the revenue of the Papal States. In the course of these various transactions the papacy made a contribution of the first importance to the evolution of the practises and techniques subsequently to become familiar in the public finance of the European states. The long term interest bearing debt, the division of loans into equal shares and free emissions first acquired their characteristic features in sixteenth century

Rome. After 1580 the ingenuity of the Curia was reflected in a sharp rise in the debt curve, interest on loans absorbing more than 50 percent of all papal revenue. In the seventeenth century there were numerous forced conversions, attempts to simplify the debt structure and consolidations of various issues into a single public debt.

However lucrative as a reservoir of taxable wealth and as the basis for an imposing superstructure of credit, the Papal States proved an altogether inadequate substitute for the less tangible foundation on which the mediaeval papacy had reared its temporal authority. Lacking the two elements which the experience of modern nation states has shown to be indispensable—an effective standing army and an uninterrupted tradition of statecraft—the Papal States consistently failed to achieve any real degree of political stability. The at times hopelessly brief tenure of office, the amateurishness resulting from the common practise of nepotism and the repeated changes in administrative methods precluded the pursuit of a coherent policy from generation to generation. In spite of the vigorous attacks of certain of the popes, particularly Gregory XIII and Sixtus V, against the feudalistic elements in the Papal States, feudalism continued to persist long beyond its day, seriously restricting the sovereignty of the pope. Instead of a well trained bureaucracy and a permanent corps of officials the state was run by holders of benefices who came and went, leaving few traces; from the fifteenth century all of the important administrative positions were conferred exclusively on clericals and prelates. Moreover the administration and execution of justice were subordinated to the fiscal policy, which received exaggerated emphasis. Because of the essential weakness of the Papal States as a basis for the exercise of effective political power the high ambitions of the early modern popes to play a major role in the councils of Europe were foredoomed. Notwithstanding the skilful negotiations of the newly created papal nuncios in the European courts of the sixteenth and seventeenth centuries and the strenuous efforts of the recently created Institute to formulate a consistent program of papal diplomacy, the temporal position of the popes in the new system of nation states became progressively more modest.

The waning prestige of the papacy in the temporal sphere has been paralleled by, and in part has contributed to, the acquisition of un-

contested primacy of honor and jurisdiction within the church itself. Overshadowed for a time by the more dramatic cleavages arising from the Reformation movements, the issue of episcopatism versus papalism flared up again in the final session of the Council of Trent, in the form of a controversy over the question of the origin of the bishop's power. The Spanish as well as the French delegates maintained that both the rank and the jurisdiction of the bishop were divinely ordained, while in addition the French insisted on an abrogation of the papal right of supervision over benefices and a basic limitation of the pope's right of dispensation. Demands were also advanced for a reform of the College of Cardinals and for election of the pope by conciliar bodies. Thanks, however, to the skill of the Jesuit leader Lainez in steering the assembly away from explosive issues, the council closed without committing itself explicitly as to the respective claims of the two rival spheres of jurisdiction. But the decision of the council to leave the matter of the reform of the Curia entirely in the hands of the pope served to assure to the Holy See the power of final review, through a congregation of cardinals, over enactments and doctrinal formulations by conciliar bodies and in effect constituted a lasting triumph for papal authority in its long drawn out struggle with episcopatism. Papal absolutism, having thus been constitutionally grounded and cut free from the restrictions which had threatened to hem it in during the late conciliar and early reform periods, became more and more firmly entrenched in the post-Tridentine era.

The steadily increasing power of the pope within the church may be attributed in no small degree to the zeal with which the papacy since the sixteenth century has devoted itself to the cause of ecclesiastical reform. In contrast to the preceding period, when reformist movements were essentially antipapal in their inspiration and objectives, the significant renovations within the modern church have resulted in the main from the initiative of the popes themselves. The most profound institutional transformation during the early stages of papal reform involved the problem of the relation between the pope and the cardinals. With a view to freeing the papal office from its subservience to the cardinals, who in the later Middle Ages and the Renaissance had constituted, more often than not, a rather narrowly self-interested oligarchic group, the reform popes radically altered the status and function of the Sacred College. As

formulated in the papal bull of Sixtus v in 1588 this change called for the inauguration of a new administrative system built up around fifteen commissions, or *congregationes*, recruited exclusively from the ranks of the cardinals. Six of these congregations were entrusted with the administration of the Papal States, while the remaining nine were authorized to deal with general church questions. Of the latter group of congregations the most important were the "foreign office," in whose province fell all "extraordinary church affairs," and the "conciliar congregation," which constituted the final board of interpretation regarding Tridentine canon. Since each congregation was given a precisely delimited sphere of competence, the individual cardinal came to occupy a circumscribed and essentially bureaucratic position in an administrative system dominated ultimately by the pope as chief executive. At the same time Sixtus v emphasized the more spiritual role of the Sacred College as an ecclesiastical élite which should take the lead in all reform movements and develop within its ranks a worthy successor to the papal office. The profound change in the temper of the post-Tridentine Sacred College is apparent not only in the more spiritual character of the individual cardinal, as typified by Carlo Borromeo, but most strikingly in the tone of the electoral contract (*Wahlkapitulation*) of the successive popes, who used the instrument—formerly manipulated by the cardinal oligarchy in its own self-interest—as a medium for safeguarding the new program of ecclesiastical reform. Despite these changes and despite several attempts on the part of sixteenth and seventeenth century popes to impose more stringent regulations, it was long impossible to free the Sacred College from the informal interference of political rulers in papal elections. To the refined technique which enabled a Philip II of Spain to influence every conclave during his reign the Curia eventually succumbed, legitimizing the practise by investing the Catholic countries of Spain, France and Austria with the right of veto. The veto was not finally abolished until 1904, when its effective exercise had passed chiefly into the hands of Austria.

A second factor which helps to account for the increased power of the papacy within the modern church was the growing realization of the necessity for an outstanding and well equipped leader in the fight against the mounting forces of sectarian heterodoxy and anticlerical secularism. The older episcopal formulae continued to

find expression in various essentially nationalistic quarters, notably among the exponents of Gallicanism in France and the leaders of the antipapal movement in eighteenth century Germany which culminated in the Ems Congress of 1786; but as a result of the profound crisis precipitated in the life of the church by the devastating anticlericalism of the French revolutionary period the forces of regionalism within the church lost much of their vitality. The outstanding role of the papal Curia in reestablishing ecclesiastical organization throughout Europe during the early nineteenth century provided a powerful stimulus to ultramontaniam.

The final concession of unlimited papal primacy was not unrelated to the sharp reaction engendered throughout a large part of the Catholic world by the militant antipapalism of those leaders of the Risorgimento who were clamoring for the extinction of the Papal States in order to make way for a united Italy. In the same year that the papacy lost the last vestiges of its temporal power through the incorporation of the Papal States into the new kingdom of Italy, the Vatican Council of 1870 promulgated the doctrine of papal infallibility. The jurisdictional and doctrinal primacy of the pope, which had been an age old source of controversy, was at last definitively established in unequivocal and unqualified terms. The final identification of papal law and church law and the arrogation to the papal office of supreme legislative and executive prerogatives within the church were effected in the great work of codification of canon law, the *Codex juris canonici* of 1917. At once the keystone and the foundation of the ecclesiastical hierarchy, the pope was acclaimed as the true representative and embodiment of the *unitas ecclesiae*. The recognition of the City of the Vatican by the Italian government in 1929 served, at least symbolically, to reinvest the papacy with that territorial sovereignty which during most of the modern period had allowed it to maintain at least an independent position among the rulers of Europe.

The prestige of the pope as uncontested head of a world wide international institution numbering its adherents in the millions has continued to lend a more far reaching significance to his pontifical pronouncements, long after the waning of his direct temporal influence. Carrying over his traditional role of spokesman for the collective conscience of a unified European community into the new era of atomistic liberalism and nationalism, he has continued to raise

his voice against the regionalistic antagonisms and warrings characteristic of the modern balance of power system. An observer on the whole rather than a participant in the negotiations which have molded the alliances and counteralliances of the modern period, his repeated proffers of good offices and his readiness to serve as arbitrator and peacemaker have made him an outstanding figure in the growing movement for international good will and cooperation. By every premise of his office an uncompromising traditionalist and authoritarian, he has made few concessions to the subversive liberal ideologies which accompanied the bourgeois thrust to power and which were pontifically proscribed in the *Syllabus of Errors* by Pius IX. The growing plight, however, of the proletarian classes since the middle of the nineteenth century, combined with the spread of atheistic and anticlerical socialism, has brought about the necessity of a less negative social program on the part of the papacy. The various efforts of the popes, notably of Leo XIII in his encyclical of 1891, to ameliorate the lot of the economically distressed sections of the population through clerical or church controlled channels constitute one of the most significant moves of the papacy to come to terms with the economic system at whose birth it assisted.

PAPER MONEY. Popularly the term paper money refers to all types of money made out of paper. In its narrower and more exact usage, however, it applies only to paper notes which are not redeemable in any other type of money and which derive their value solely from the legal tender quality bestowed upon them by the sanction of the state. Paper money proper thus shares the characteristics of all types of money—metallic, or commodity, money—in which the face value is greater than the value of the material substance of the money unit, with the difference that while in the latter the range of depreciation is limited by the intrinsic commodity value of the monetary unit, in paper money depreciation is practically unlimited.

Although monetary systems of coins whose value did not originate with the material from which they were made but from the legal tender quality imparted to them by the state were known in antiquity, for example, the replacement of silver by copper coins in the Roman Empire, the practise of issuing paper money was largely a development of relatively recent times associated originally with the issuance of banknotes. The banknote was a kind of check issued to bearer payable in lawful metallic money upon presentation and demand of the bearer. In times of financial stress, however, the banks were frequently unable to redeem their issues, in which case the government suspended the obligation of the bank to redeem the notes in standard coin; and the note, originally a promise to pay in coin, was thus transformed into paper money

proper. Another source of paper money in modern times is the government treasury; in seeking the means to cover government expenditures in times of fiscal stress it resorts to printing notes, which if irredeemable and endowed with legal tender constitute paper money.

As the paper note was originally introduced as a promise to pay, that is, as a temporary substitute for metallic money, the value of paper money was held to depend upon and to be determined by the degree of confidence which the promise of future conversion into metallic money inspired. This assumption, however, is erroneous; the value of paper money derives principally from the monetary functions which it performs. Its value inheres in its character as legal means of payment of taxes, of liquidating debts and of storing up wealth. This value can be maintained without regard to any promise of future conversion into metal, provided of course that the volume of circulating media is regulated to conform to the monetary requirements of trade. That it is possible to keep the value of paper money stable even when it is divorced entirely from a metallic standard was proved by the Austrian experiment with paper money in 1879 and by that of Russia in 1893.

The advantages offered by the issue of paper money are obvious. It is cheaper to issue paper money than metallic money. It presents a more flexible instrument for adjustment of the volume of circulating media to the requirements of trade. Moreover under a paper money system nations are not exposed to the danger of losing their monetary stock by exportation, as happens in the case of metallic money.

Equally obvious, however, are the limitations of paper money. The problem of regulating the currency constitutes a continuing source of difficulties. The existence of a paper money standard offers the government an ever present temptation to use the printing presses in order to meet government expenditures rather than to resort to the less popular means of increasing the tax rates; the value of the monetary unit is thus threatened. The overissue of paper money invariably leads to depreciation of the money unit, which in turn produces grave social and economic disturbances. Depreciation has sometimes reached extreme limits, as in France under the John Law experiment of 1720 and during the revolutionary period of 1789-96, in the United States during the colonial period and again during the revolution, in Peru in 1887 and more recently during the wave of deprecia-

tion which engulfed the monetary systems of Germany, Russia, Austria and other countries. In all these cases persons with fixed incomes, the entire creditor class and holders of cash suffered what amounted practically to complete confiscation.

Of still greater importance is the problem of regulation of foreign exchange under a paper money standard. The great advantage of the gold standard consists in the relative stability which it imparts to foreign exchange by confining the range of fluctuations in foreign exchanges within the limits of the gold points. The existence of a paper money standard inevitably widens the range of fluctuations, thereby causing grave disturbances in international credit relations and world trade. The task of regulating the foreign exchanges under a regime of paper money is one of the outstanding problems awaiting solution.

The frequent abuses of the government printing presses and the general uncertainties prevailing under a paper money regime have brought it into disrepute and induced the various countries which had adopted the system to depart therefrom and to return to a metallic standard. The methods of returning to a metallic standard have varied according to the extent of depreciation. Where depreciation of paper money in terms of gold or other standard metal has not been too extensive and too prolonged, the return has been effected by reestablishment of the convertibility of paper notes on the original basis. This procedure was followed in England in 1821, in the United States in 1879, in France in 1878, in Japan in 1886 and more recently in England in 1925. Where, however, depreciation has been allowed to go too far and endure too long, conversion of the paper notes at par, that is, the return to the original gold basis, is impossible in view of the grave economic disturbances it would involve. The excessive appreciation of the currency would necessitate a drastic decline in prices and thereby create insuperable hardships for the class of debtors and generally for the producers of the country. Moreover it would bring unmerited wealth to many who might not have suffered from previous depreciation of currency. Under such circumstances convertibility is usually reestablished at a lower gold basis, which is generally set in the neighborhood of the average value of the paper currency in terms of foreign exchanges of gold standard countries during a set period preceding the return to the gold standard. This method of return to a gold

standard was followed in Russia in 1897, in Austria in 1892, in Chile in 1895 and in 1925, in Argentina in 1899, in Brazil in 1906 and more recently in France and in other countries which depreciated their currencies during the World War and the post-war period.

Finally, where the depreciation of the paper note has been complete, as in the case of the German paper mark in 1923, the return of the gold standard takes the form of establishment of a new monetary system. The problem of fixing the gold content of the new money unit adopted in place of the depreciated currency presents no great difficulties. In Peru in 1887, when paper money was totally depreciated, the monetary system based upon the Peruvian sol was replaced by a unit corresponding to the British pound sterling. The depreciated German mark was replaced in 1923 first by the Rentenmark and in 1924 by the gold mark with full pre-depreciation value.

PAPER AND PULP INDUSTRY. *See* PULP AND PAPER INDUSTRY.

PAPINIANUS, AEMILIUS (c. 150-212), Roman jurist. It is supposed that Papinian was born in Syria. His nationality is attested by his relationship to the second wife of the emperor Septimius Severus, Julia Domna, who was born in Syrian Emesa. Papinian was a close friend of the emperor, but the belief that he studied with him under the jurist Scaevola and succeeded the emperor as *advocatus fisci* must be attributed to an interpolation of a thirteenth century scribe. He did, however, hold the office of *magister libellorum*, and from 203 until at least the death of Severus he was praetorian prefect. Papinian incurred the enmity of

Caracalla and was put to death in February, 212.

Six works of Papinian are known. Of these the thirty-seven books of *Quaestiones* and the nineteen books of *Responsa* are the most important. The former give answers to doubtful legal questions of general significance, while the latter apply undisputed legal rules to particular cases. The last eleven books of the *Responsa* differ from the first eight and more nearly approximate the *Quaestiones*; some scholars explain this on the ground of posthumous publication. The less important works are a Greek treatise on minor provincial municipal officials, two books of *Definitiones* which present a summary of existent legal rules, two books on adultery and a supplemental single book on the same subject.

The acumen and independence of Papinian's criticism together with his recognition and careful evaluation of the practical necessities of life place him high among the juristic thinkers of the world. In postclassical and Justinian times Papinian occupied a position of major importance. His opinion was decisive in the famous law of citations; third year law students were termed Papinianistae and specialized in his works; and his writings were utilized in various collections, notably the Vatican Fragments and the Digest of Justinian. Excavations in Egypt have recently added new fragments of his *Responsa* to his extant works and modern scholars are prone to agree with the epithets of praise of Justinian, Cassiodorus, Hieronymus and others, although he is no longer regarded as indisputably the greatest of the Roman jurists.

PARDON. A pardon is an act of grace which results in the remission of the legal consequences of crime. The term pardon is sometimes used in a generic sense, however, and thus includes all forms of clemency. A pardon is to be dis-

tinguished from a reprieve, which is only a suspension of sentence of execution. It is also to be distinguished from an amnesty (*q.v.*), which is rarely if ever invoked in favor of an individual but is commonly employed in favor of classes of persons who are subject to trial but have not yet been convicted. A pardon may be either absolute or conditional.

Evidence of the use of pardons in a crude form extends back to primitive times. The Code of Hammurabi contains no reference to clemency, but it is known that Samsu-iluna, Hammurabi's son, pardoned a slave who had forfeited his life. Although the Mosaic law makes no mention of the subject, King David used the pardoning power, and cities of refuge were provided where fugitives who had innocently shed blood might obtain security from the fury of the avenger. In Athens the assembled people had the right to remit penalties, and the civil law of Rome recognized the right of the emperor as sovereign to grant clemency.

Clemency was practised also among the early Germanic tribes. It was recognized in England in the laws of Aethelberht of Kent, Alfred and Edward the Confessor and later was approved by such early jurists as Glanvill and Bracton. The English conception of clemency was transplanted to the American colonies, where its use by the authorities was regarded as a delegation of the royal prerogative. This view was superseded after American independence by the idea that the power to pardon was a sovereign power inherent in the state, although the principles of English legal construction were retained by American courts.

Because of the multiplicity of jurisdictions the modes of administration of the pardoning power vary greatly in the United States. The power is conferred most frequently on the governor, who may be aided by an advisory pardon board, but it may rest entirely with a state board of pardons of which the governor is a member. The membership of these boards is subject to wide variation in number and character; usually they are composed of various state officials who sit *ex officio*.

The procedure at hearings for pardons also varies greatly. In some states they are open and in others closed. Evidence is usually not presented under oath, and the conduct of the hearing is quite informal. Some states subpoena witnesses while others do not. In some states applicants are represented by counsel; in others the practise is discouraged.

The president of the United States has full power to pardon for all federal offenses except in cases of impeachment. Petitions for presidential clemency are always submitted to the attorney general, who has them investigated by the attorney in charge of pardons before they are acted on by the president. In Great Britain the crown acts on clemency petitions upon the advice of the home secretary. In Germany the pardoning power is vested in the president of the Reich, whose authority is, however, limited for it extends only to the action of the federal courts. Since the administration of justice is with few exceptions left to the individual states of the Reich, these normally exercise the pardoning power. Although in general the power to exercise clemency is vested in the chief executive of a nation, in the Soviet Union it lies within the jurisdiction of the All-Russian Congress and the All-Russian Central Executive Committee. In Turkey this power rests with the Grand National Assembly.

Generally the executive is restricted in bestowing clemency in cases of treason and impeachment and in grants of general amnesty. In twenty-four states in the United States the governor cannot pardon for treason, and in forty-two states cases of impeachment are excluded from the jurisdiction of the executive pardoning authority. Generally the chief executives are denied the right to pardon in cases of impeachment. If clemency is granted in such instances, the authority is usually exercised by the legislative branch of government. Despite the disuse into which impeachment has fallen as a result of the evolution of the parliamentary control of ministers, it is evidently still regarded as sufficiently valuable to make it desirable to bar executive interference.

Since a pardon is an act of grace it cannot be demanded as a matter of right. It is normally issued on the theory that the person who receives it is guilty. If conviction is the result of error the proper procedure is to attempt to have the verdict modified or set aside. After the lapse of a certain time, however, the courts no longer have the power to take such action. An application for a pardon then becomes the only method of rectifying a miscarriage of justice.

A pardon not only removes the penalty but, in contemplation of law, places the offender in the same position as if he had never committed the offense [*Ex parte* Garland, 71 U.S. 333 (1866)]. The United States Supreme Court also held in this case that the president may pardon

before or during trial as well as after conviction. In the United States a pardon is of no effect until it has been delivered and accepted, but a commutation of sentence is operative without acceptance [Chapman v. Scott, 10 Fed. (2nd), 156, 690 (1925-26)]. Although a full pardon restores the usual civil rights it does not restore offices which were forfeited or property interests which have become vested in others as a result of conviction. An unconditional pardon which has been delivered and accepted cannot afterwards be revoked except for fraud, and a court of equity has power to determine if a pardon was procured by such means (196 Iowa 1233).

In 1925 the Supreme Court of the United States held that the president could pardon for indirect judicial contempt (*Ex parte Grossman* 267 U.S. 87). Later in the same year the Supreme Court of New Mexico held that the governor could pardon for direct contempt committed in the presence of the court (*Ex parte Magee*, 242 Pac. 332). Pardon for civil contempt cannot be granted, since the punishment is remedial; that is, for the benefit of the complainant. It is uncertain whether the executive may pardon for legislative contempt.

Any realistic analysis of the pardoning power must also take into account the fact that agencies of government other than those formally entrusted with its exercise do in fact have virtual power to extend clemency. In ancient Rome some offenses were created by edict but the degree of punishment was left to the discretion of the magistrates. Modern courts of justice direct verdicts of acquittal, set aside judgments for mistake or fraud, stay executions of sentence and remit penalties for contempt of court. Prosecuting attorneys may enter a *nolle prosequi* to discharge defendants under certain conditions. The French penal code, which permits the jury to decide when there are mitigating circumstances, requires the judge to take such a finding into consideration by imposing a more lenient sentence; even in the absence of such legal power juries often bring in verdicts which can be regarded only as acts of clemency. Sometimes the pardoning power is delegated, as in Germany and in some other states, where the right to remit certain penalties imposed in the administration of the tax code is conferred on the national minister of finance.

Since the time of Lombroso the scientific study of criminology has greatly altered the attitude toward crime. The present trend is to discount the existence of a hereditary criminal

class and to regard environment and circumstances as leading factors in the making of the criminal. His treatment therefore must be directed toward the possibility of cure rather than toward the imposition of punishment. As a result pardon authorities now find themselves in a difficult position. On the one hand, each case should be considered as an individual problem; on the other, inconsistent and arbitrary action should be avoided. Complaints of the abuse of the pardoning power are quite widespread. Hence it has been insisted that the application of fixed rules and regulations will result in a reasonable adherence to constancy and fairness and at the same time will secure individualization of treatment. The indeterminate sentence, parole and judicial discretion in imposing sentence are but preliminary steps. Further advances may involve revision of criminal codes and radical change in the personnel and training of pardoning authorities and even of the judiciary itself.

PARENT EDUCATION. The parent education movement can best be understood as a mode of cultural adjustment based on the assumption that the home, in spite of the taking over by outside agencies of many of the functions of child care and training, is still the most important influence on the personality development of the child. The basic purpose of the movement is to foster insight on the part of parents into their own personalities and into their family relationships.

Its origin in the United States is fairly recent and is twofold in character: professional on the one hand, and lay on the other. Data collected independently in various branches of the social sciences—particularly in psychiatry and mental hygiene—have in the last decade increasingly impressed educators, social workers, physicians and religious leaders with the importance of the home in child training. As a result parent education has developed from an attempt on the part of agencies which serve children and the community to make parents aware of the new knowledge and technique of child care. On the other hand, parents themselves have begun to realize that the traditional methods of rearing children do not fit individuals to meet complicated modern social and economic conditions, and they are turning to every relevant branch of knowledge for guidance. As early as 1888 such initiative taken by a group of parents under the leadership of an experimentally minded teacher in New York led to the founding of the Society for the Study of Child Nature, which eventually became the Child Study Association of America. Similarly, the forerunner of the National Congress of Parents and Teachers was the Congress of Mothers organized in 1897. Thus parent education, while strictly speaking not a folk movement, resembles one to the extent that it has derived its impulse from the interest and initiative of parents themselves.

The professional status of the movement arises from methodology and point of view rather than from content, since in order to help parents meet actual situations and problems it is necessary to introduce them to knowledge from many disciplines—hygiene, nutrition, sanitation, psychology, mental hygiene, education and others. Its uniqueness lies in the application of varied subject matter to the specific problems of parenthood. Because it implies education for parenthood and includes pre-parental training as a major and integral part of its program, it is more than an auxiliary phase of adult education.

In almost every state of the Union and in several territories pre-parental instruction, including courses in child care ranging from sixth grade to graduate work, is being given in hundreds of schools and colleges, and programs for adolescents and pre-adolescents are being carried on by churches, settlement houses and such organizations as the Girl Scouts, the Camp Fire Girls, the Young Men's and Young Women's Christian associations.

In spite of a background of forty years of interest in child study the term parent education has been in use hardly more than a decade, dating apparently from a time when various organizations and services realized that they were all engaged in some phase of educating parents and that their common purpose could best be served by cooperation. In anticipation of a rapid development of both lay and professional aspects of the movement the National Council of Parent Education was organized in 1925 to serve as a clearing house for participating agencies and to promote affiliation between adult education and child welfare groups. By 1928 the first informal organization had definitely become a coordinating and consulting center for the various organizations carrying on parent education work, and the aims and policies of the council are representative of the present trend of parent education in the United States and Canada.

In 1925, when the movement was developing rapidly, many leaders expected a distinct profession of parent education to emerge. Others believed that the promotion of additional organizations and specialists would be less effective than the dissemination of the newer knowledge of child development through already functioning social, educational and health agencies. That the latter course has prevailed is doubtless fortunate, since the early diversity of organization, purpose and programs preserved the vitality of the movement and kept it closer to the actual needs of the parents whom it purposed to serve. The relationship between the National Council of Parent Education and its seventy member organizations is loose. Any agency which is working with or for parents is eligible for membership in the council, and no attempt is made to dictate methods or programs. The list of members contains such varied organizations as the American Association of University Women, the Metropolitan Life Insurance Company (the only commercial organization holding membership), the Child Study Association of America, the American Social Hygiene Associa-

tion, the Federal Council of Churches, New York Hospital, Cornell Medical Center, the National Congress of Parents and Teachers, the Federal Board for Vocational Education, the Bureau of Home Economics and the Office of Education. Although approximately half of the member organizations are tax supported, the movement as a whole retains its private character. In institutional programs where parent education is but one phase support is usually derived from foundations, although funds are also contributed from federal, state and city sources. Programs within organizations specially designed for parent education are in general supported by membership dues, gifts and occasional small appropriations from foundations.

The programs carried on by different organizations for parent education are widely varied. Parent education is frequently associated with other activities, as, for example, in the eighteen research and training centers established by grants from the Laura Spelman Rockefeller Memorial, where parent education work is closely related to research in child development carried on in nursery schools, preschool laboratories and child guidance clinics. The majority of the child welfare research centers are connected with state universities, normal schools or teachers' colleges and conduct graduate courses for training professional leaders in parent education. In some states parent education, affiliated with an agricultural program, is part of the home economics extension service; in others it is a phase of the home economics division of vocational education; in still others it is an independent unit.

A survey of typical parent education programs made for the White House Conference on Child Health and Protection in 1930 revealed the following activities carried on in forty national, state, city or university programs: teaching parents in groups or singly; training professional and non-professional leaders; preparing illustrative material for the use of parents or parent educators; conducting research; stimulating interest in parent education activities. National programs for the most part concentrate on the instruction of parents, the provision of material for use in executing projects and the building up of favorable public opinion. State and university programs are primarily concerned with training lay and professional leaders, and city programs with teaching parents and preparing research material for their use.

An analysis of the content and scope of

various activities is another index of the present status of the movement, particularly in respect to tendencies toward crystallization of practices and attitudes. In April, 1930, a questionnaire was sent out by the federal Office of Education to 2533 organizations on its mailing list to ascertain the extent of parent education in the United States in terms of the number of agencies, their geographic distribution and the prevailing types of program. Of the 619 replies that were received 378 reported work consciously recognized as parent education, involving a total of 2161 workers in parent education and 5687 study groups, reaching during a year an estimated number of 500,000 parents. Regardless of whether the programs were major, minor or incidental, they all closely followed the same method. Although parents are to some extent taught in groups, consultations are the most frequent method of instruction and are carried on in connection with group technique so far as the personality, time and training of the leader permit. Significantly, half of the programs base their choice of content on the needs expressed by the parents themselves. The subject matter topics which follow are given in descending order of interest as reported by the agencies: behavior problems; child care; mental development; family relationships; physical development; sex education; mental hygiene; toys and play equipment; clothing; literature; recreation; adolescent problems; home hygiene; family nutrition; home management; handicapped and retarded children; special abilities; heredity; speech development; educational techniques; religious education; vocational guidance. The composite picture shows lessened interest as the topics go from subjects of immediate concern to parents to the more specialized subjects of child care and training. Beyond the highly important fact that the present emphasis is placed on the behavior of the child, it is difficult to interpret these data. They do not reveal another tendency which other evidence renders unmistakable. Within the last decade emphasis has shifted from a predominant interest in the child to interest in the parent and finally to relationships within the family. This trend has closely paralleled the findings of psychiatry and is the direct contribution of mental hygiene. It indicates a conscious attempt on the part of educators and specialists to utilize the interests of parents and to recognize them as personalities apart from their parental function, in contrast to older methods of propaganda and indoctrina-

tion. The National Council of Parent Education is assuming leadership in the endeavor to find more effective methods of helping parents and teachers to utilize scientific knowledge in their daily activities. To this end a committee on studies and researches was organized following the third biennial conference of the council in 1932. This committee aims to study and clarify the field of parent education and family relationships in terms of educational methods and social policies, to prepare and keep before interested workers a comprehensive plan for research in parent education and family relationships and to counsel with research centers upon request regarding problem areas in which research may be needed and regarding feasible and fruitful methods of research in this general field.

Before an attempt is made to evaluate the parent education movement as a whole, a comparison of its development abroad with that in the United States is pertinent. The origins and trends of the movement already described are also evident in England and continental Europe, although in almost no other country has progress been as rapid as in the United States. This retardation has been due chiefly to economic and political conditions in post-war Europe rather than to lack of interest in or responsibility for child welfare.

In Russia parent education work is undertaken in connection with health centers and nursery schools. All teachers are expected to work with mothers to try to transform home environments, at least along sanitary lines. Agencies serving children under three years of age are the responsibility of the Commissariat of Health; all other institutions concerned with children are under the direction of the Commissariat of Education. Instructions published by the People's Commissariat of Health for summer rural nurseries are typical of the Soviet attitude toward parent education: "All this work will be of maximum value only if those in charge maintain the most intimate relations with parents. Of paramount importance are talks with mothers, observations of children at home, directing attention of parents to defects in bringing up, and offering practical suggestions." In connection with every trade union and factory there are nursery schools for the education and care of children. Exhibits, posters and various forms of personal instruction are carefully worked out for the education of illiterate mothers. These methods are all designed to free the working and peasant women from household

cares and to include them in the social life of the country as well as to instruct them in the care of their children. In Russia pre-parental education may be said to begin in the nursery school.

In England parent education has from the first been closely integrated with the educational system, especially with the nursery schools and kindergartens, most of which were philanthropic in purpose. The two organizations most active in the field of parent education are the Home and School Council and the Parents' National Educational Union, both organized in connection with primary and secondary schools. Their programs and methods are similar to those of parent-teacher organizations in the United States.

Parent education in Germany is unique in one respect, in that the fathers are equally concerned with the mothers. In every German school a parents' council represents the fathers and mothers of the district—one member being elected for each fifty children—and acts in an advisory capacity to the teaching staff. These councils (*Elternbeiräte*), whose meetings are attended by teachers as well as parents, endeavor to promote cooperation between the home and school and to some extent serve the same purpose as the parent-teacher organizations in the United States. Through health clinics connected with the schools a further effort is made to develop in parents a sense of community responsibility.

Among the organizations furthering the same purpose internationally that is served by the National Council in the United States are the Commission Internationale de l'Éducation Familiale and the International Federation of Home and School. The former, organized at Liège in 1905, distributes an annual questionnaire to its members in order to find out the extent of work that is being done in parent education, specifically in terms of organizations, cooperation with churches and schools, conferences, current publications and the use of films, radio and other publicity media. The International Federation of Home and School was organized at a meeting of the World Federation of Education Associations at Toronto in 1927 chiefly to encourage the formation of national parent education groups in its member countries, which in 1932 numbered thirty-one.

An important development in the parent education movement in all countries is the increasing use of current magazines and journals as channels for the dissemination of information.

The significance of this literature lies in the number of parents who are reached directly. There are three types of publication offering material for parents and teachers: journals designed especially to serve parents and parents' interests; periodicals serving special fields of education or science which include parent education material relevant to the specialists concerned; popular women's magazines with occasional articles or special departments for parents. Newspapers frequently furnish similar reading matter, chiefly through syndicates which provide daily or weekly articles on child training to many papers throughout the country. The use of the radio as well as the press has proved especially effective in making parent education available to families in rural districts.

The limitations of the parent education movement are inherent in its loose organization and rapid growth. Specialization often conceals a lack of concern for child welfare, and the individual limitations of leaders prevent the necessary correlation of programs. The future of the movement depends on its success in making parents class conscious and aware of their responsibility for what special groups and agencies are doing to their children. To this end educational facilities for parents must be developed as a normal part of a broad educational program which is truly social and suited to fathers as well as mothers, while the training of all those who work with children and parents must include the fundamental facts of mental hygiene, child development and family relationships. Finally, the effectiveness of the movement will depend in large measure on the extent to which it becomes a community responsibility incorporated in the public education program.

PARETO, VILFREDO (MARCHESE DI PARIGI) (1848-1923), Italian economist and sociologist. Pareto came into the social sciences late in life after an education mainly in mathematics and physical science and some twenty years' experience as a practising engineer. He then interested himself both in the economic implications of contemporary political questions and in the applicability of mathematics to the formulation of economic theory. His work in the latter field attracted the attention of Léon Walras and led to Pareto's appointment in 1893 to succeed him as professor of political economy at Lausanne.

The best known of his earlier contributions is the much discussed Pareto's law of income distribution, the statistical basis of which has been so severely criticized that it is not now generally accepted. Pareto's most important contributions to economics, however, lie in the field of general economic theory. Here, although he was an "orthodox" economist, his position differs in important respects from that generally held in Anglo-Saxon countries. He went farther than anyone in his generation to work out a mathematical formulation of the system of economic equilibrium as a whole. In spite of the fact that, as Pareto was well aware, his equations could not be solved, on account both of lack of data and of the great number of variables, his achievement was of the greatest importance from the point of view of logical clarity.

Furthermore Pareto realized and emphasized the abstractness of economic theory. He held that it deals with type actions which are logical with reference to the processes of securing means to satisfy wants. Both the wants themselves and the ultimate obstacles to their satisfaction must be taken as data by economic science. Above all Pareto showed that by the use of indifference curves it was possible to formulate all the equations of economic equi-

librium without recourse to the concept of utility, and he thus emancipated economic theory from the last vestiges of dependence on psychological hedonism. He also departed from orthodoxy by working out a complete theoretical framework not only on the usual competitive assumptions but also on those of monopoly and of collectivism, all three being of concrete importance. Clearly he did not hold that economic theory alone is capable of an adequate complete explanation of concrete social events.

Acutely conscious of the concrete problems his economics could not solve, he felt an intense need for a broader science to supplement it and so turned to sociology. For material he depended largely on two sources: first, his encyclopaedic knowledge of the history and literature of classical antiquity, the fruit of a lifelong interest in these subjects; and, second, his detailed knowledge of the inner workings of modern government, acquired from years of study of contemporary politics. Although he was unable here to carry the application of the methods of the physical sciences as far as in economics, their influence was of the greatest importance to his sociology as a model of method as well as for the central position of the problem of the role of scientific knowledge in human action.

In fact his whole sociological theory turns on the concepts of "logical" and "non-logical" action. The former is formulated with the type of economic action primarily in mind, as action rational with reference to a given subjective end. The main analytical problems of Pareto's sociology, however, concern the other type. Once having abstracted the logical elements he attempts to study non-logical action inductively and on this basis distinguishes two main elements. One, a highly variable factor, consisting of logical or pseudo-logical reasoning about action, he calls "derivations." The other, the relatively constant element, a "manifestation of sentiments" not rationally based or justified, he calls "residues."

In attempting to interpret these concepts one finds a very serious ambiguity, of which Pareto himself apparently was not aware. When thinking of logical action mainly in economic terms, he conceives action as non-logical only in so far as it is not determined by the conscious purpose of the acting individual. Here the main factors in non-logical action become the instincts and drives of anti-intellectualist psychology, and "ideas" play at best a minor

part. But intertwined with this is an entirely different strand of thought. Its starting point is a narrower concept of logical action in terms of scientific knowledge alone, where from the point of view of the acting individual only knowledge of empirical external facts and strictly logical deductions from such knowledge enter into action. All subjective ends thus become non-logical elements. Here Pareto does not question the role of subjective ends, but rather the scientific status of such ends, denying that they are scientific facts. On this line of thought the residues turn out to be precisely these non-scientific subjective ends; in short, ideals or values. His theory of the residues instead of being a means of minimizing the role of values in history is thus an affirmation of it. His attack is on a very different thesis: that the really important ideas for action are those of science.

While the first strand of thought furnishes the usual interpretation of Pareto's concepts, the second may be considered the more important, particularly in its theoretical consequences. Furthermore the ideal ends on which Pareto lays stress, those of religious and ethical systems, are in a sense essentially social, marked off sharply from the essentially individual wants of economics. Thus Pareto may with proper precautions be claimed as an adherent of social "realism," an aspect of his thought which obtrudes most sharply in his discussion of the theory of social utility, where, for instance, he speaks of "the end which a society pursues" as distinct from those of its individual members.

Pareto's most important contribution to the concrete interpretation of social phenomena lies in his cyclical theory of social change. This is conceived of as the alternate predominance in the governing groups of two classes of residues, the instinct of combinations" and the "persistence of aggregates." The latter describes a type of action in which ideal ends are predominant and is characterized by subordination of individual and immediate interest to them; the former type is that of absorption in immediate and tangible interest.

The cycle has three main aspects, political, economic and ideological. The political cycle starts with the accession to power of men strong in the persistence of aggregates, the "lions," who because of the very absoluteness of their belief in ideal ends use force to pro-

mote them. But the exigencies of maintaining power, especially the inconvenience of force as an instrument, causes them to turn to "ruse," to become "foxes." This in turn favors the rise from below of men skilled in ruse and prevents that of those strong in the persistence of aggregates. The result is a dilution of these residues in the governing classes and finally a state of disequilibrium leading to their overthrow. In the economic field there are the "rentiers," who though savers are timid and have little enterprise, and the "speculators," the economic counterpart of the political foxes, strong and daring but tending to extravagance and instability. Finally, there is a similar alternation of predominant skepticism in the intellectual sphere, accompanying the rule of the foxes and speculators, and of faith at the opposite extreme.

Contemporary society Pareto regarded as nearing the extreme of possible predominance of the residues of combination. The Fascist movement, of which he was sometimes held to be a prophet, may be regarded as one element in the expected reaction toward the opposite phase of the cycle. Pareto's intellectual detachment, however, made it quite impossible for him to be an ardent adherent of any political movement.

In spite of its inconsistencies and incompleteness Pareto's sociology may be considered as one of the first and thus far one of the few most important attempts to rebuild on the ruins of the fallen classical positivism, as represented, for instance, by Spencer. While Pareto was himself too deeply embedded in positivistic thought to achieve complete emancipation, he nevertheless broke through the old shell and took long steps toward the construction of a new edifice of theory.

PARIS, MATTHEW (c. 1199-1259), mediaeval chronicler. A writer of supreme energy and an exquisite draftsman (he had had a goldsmith's training), under Abbots William and John II he was appointed to continue the St. Albans chronicle at the point where Roger of Wendover stopped, and he is accordingly responsible for the section from 1235 to 1259 together with the revision of the chronicle as Wendover left it. He wrote an abridgment of this (the *Cronica maiora*), known as the *Historia Anglorum* or *Historia minor*, containing one of the earliest maps of England, as well as the *Lives* of the first twenty-three abbots of St. Albans down to 1255, later incorporated by Walsingham into the *Gesta abbatum*; he also compiled the greater part of the *Liber additamentorum*, or document book to his larger chronicle. Paris was so occupied in the *scriptorium* that he never received office in the abbey and seldom left it. Outside his writing his only important mission was to Norway in 1248 when he was sent at King Haakon's request to instruct the Benedictine Abbey of Holm in the statutes of the order; but he must have interviewed and questioned every visitor of importance at St. Albans, and he was intimate with Henry III as well as with royal justices and governmental officials. With his little staff of writers he had full access to all abbey charters and muniments, papal bulls and letters from correspondents abroad. As a result his chronicle is the fullest and most informing English narrative source for the period, valuable

for the contest of empire and papacy as well as for the reign of Henry III. Paris was a bold and patriotic Englishman who viewed with suspicion the activity of aliens in church and state, could not understand religious "enthusiasm" (as a conventual he disliked the Franciscans), admired the clerical and baronial critics of royal policy and criticized bitterly Henry III's extravagance and love of foreign enterprise. His heroes were Hubert de Burgh, and Robert Grosseteste, whose opposition to Innocent IV he exaggerated considerably; significantly, he wrote lives of Thomas Becket and Stephen Langton. He has been called "Macaulay minus the style," a phrase which is apt as regards his Whig principles but does scant justice to his literary gifts. His influence has been powerful in establishing the hostile view of Henry III, particularly in regard to the papacy. It may be doubted whether, for all his ability, he understood the higher politics of Christendom; but he had the historian's requisite, love of a good story and an incomparable way of telling it.

PARKER, CARLETON HUBBELL (1878-1918), American economist. Miner and bond salesman before he entered academic work, Parker did not begin his teaching at the University of California until 1913; in that summer occurred the hop pickers' riot which precipitated his characteristic interest in labor psy-

chology. During the five remaining years of his life he served for a year as executive secretary of the State Immigration and Housing Commission, became head of the department of economics and dean of the University of Washington College of Business Administration and engaged in the wartime mediation of industrial disputes with marked success and the reckless vigor that led to his early death.

His one book, *The Casual Laborer, and Other Essays* (ed. by C. S. Parker, New York 1920), describes the "indignity, dirt and sexual apologies" of the migratory worker's life and interprets the Industrial Workers of the World as the natural outcome of "the condition of mind" of the "neglected and lonely hobo." For Parker the strike was an "inferiority compensation" rather than an instrument, and a union less an agency than a symptom whose presence raised the question why individuals were unhappy in modern society. Conventional economics, with its emphasis on production and its neglect of human motives, supplied no answers to this question; and in search of them he read eagerly and eclectically in the current psychology. In McDougall's and Thorndike's "instincts" he found what he believed to be "the standard of human values" which economics lacked and in the psychoanalytic doctrine of repression the clue to industrial disorders. The trouble lay in the conflict between "a fixed human nature" and a world which warped and thwarted it; the social program which Parker sought was therefore the creation of an environment in which these fundamental urges should find free expression.

Since Parker's time psychology has given up the conception of the complex instincts on which he relied, and few scholars are likely to believe that any "twenty odd . . . unit characters . . . present under the laborer's dirty blouse" contain in themselves the criteria of an ideal social order. The harnessing of psychological insight to the service of economics has proved harder than Parker realized, but no one has been more effective in arousing colleagues and students to a sense of the importance of the task.

PARKER, FRANCIS WAYLAND (1837-1902), American educator. From 1853 to 1872, with the exception of the Civil War years, Parker was engaged as school teacher, principal and later superintendent in his native New Hampshire, in Illinois and in Ohio. Entering the Union army in 1861, he served with distinction throughout the war and rose to the rank of colonel. In 1872 he went to Germany to study philosophy, psychology and education. Upon his return in 1875 he was appointed superintendent of the Quincy, Massachusetts, schools and in five years made Quincy the educational Mecca of the country. Thousands of teachers visited the schools and enrolled in Colonel Parker's institutes to study the reform of educational theory, curriculum and method. Here they saw put into practise certain basic theories of Comenius, Herbart and Fröbel and the doctrine of concentration developed by Herbart's disciples Ziller, Stoy and Rein. At Quincy the memorization of textbooks was abolished and the child instead of the subject became the correlating center of education. Science and geography were based on outdoor observation. In reading emphasis was placed on meaning rather than on exactness of pronunciation. The school-room became a pleasant place of varied activity, combining discussion and manual work with art and dramatics.

These initial experiments were expanded into a broader program in Chicago, where Parker served as principal of the Cook County Normal School for sixteen years (1883-99). In spite of attacks from politicians and entrenched textbook interests the Normal School became a national center of educational demonstration and teacher training. Here Parker expounded novel concepts which are characteristic of current progressive education: for example, the school as a community and the teacher as a builder of community life; child interest as the motivating foundation of educative effort; self-activity as the first law of growth; the balancing of freedom with responsibility; and the constant utilization of the social motive. Thus in a very real sense Parker was the founder of the modern progressive school in the United States.

In 1899 Parker began the third phase of his career as head of the Chicago Institute, a private center of educational experimentation. Two years later the institute was combined with three existing schools to form the School of Education of the University of Chicago, with Parker as director. His plans for the development of the

new institution were cut short, however, by his death early in 1902, after which leadership was taken over by John Dewey.

PARKER, THEODORE (1810-60), American preacher, scholar and social reformer. Parker broke with the orthodox Unitarian church and organized in 1845 the Twenty-Eighth Congregational Society in Boston, serving as its pastor until his death. A disciple of Emerson and Channing, he attempted to revitalize the formal and intellectual Unitarianism of the 1840's and to liberate it from the trammels of philosophical sensationalism and the formalism of creeds. He unhesitatingly placed his pulpit and his pen at the service of the great reform movements of his generation—antislavery, temperance, women's rights, education, labor and peace. He held that society rather than the individual was responsible for crime, vice and poverty and denounced the evils of industrialism and the maldistribution of wealth. An indefatigable and eloquent lecturer, Parker stirred thousands throughout the entire north and his printed sermons had an enormous circulation and an incalculable influence. Like Garrison and Phillips he admitted no compromise with slavery and his philippics against the institution and its defenders, north and south, are unmatched in American pulpit eloquence. He was the counselor of Sumner and Seward, Chase and Hale, and, with his immense and loyal following, a power to be reckoned with in the politics of the 1850's. His participation in the attempted rescue of Anthony Burns brought him into conflict with the federal authorities, but his prestige and power were so menacing that the indictment was quashed and he continued his antislavery activities until the end of his life.

Parker also found time to achieve a massive learning that was unrivaled in his generation. He was chiefly instrumental in introducing to the United States the methods and conclusions of German theological scholarship, and by his

insistence upon the application of historical and scientific methods to the problems of theology he may be said to have inaugurated the "higher criticism" in the United States. Although his *A Discourse of Matters Pertaining to Religion* (Boston 1842, 4th ed. 1856) and the volume *Sermons on Theism, Atheism and the Popular Theology* (Boston 1853) were the only original scholarly works he completed, his erudition in the fields of literature, philology, languages, philosophy, history and law was phenomenal. His private library, one of the largest and finest in the country, he bequeathed to the city of Boston, and it remains a noble monument to his love of learning, his catholicity of intellect and his faith in education and in democracy.

PARKES, SIR HENRY (1815-96), Australian statesman. Parkes was born in England and endured great poverty in his youth. He became interested in radical political movements and was an active Chartist before emigrating to New South Wales in 1839. There he worked as a farm laborer, customs official and ivory turner, finally giving up this trade to devote himself entirely to journalism and politics. From 1850 to 1858 his newspaper, the *Empire*, led the attack on Wentworth and the squatting interests and helped to secure a democratic constitution. Parkes' parliamentary career began in 1854; between 1872 and 1891 he was five times premier of the colony and became the leading figure in Australian politics.

A radical democrat anxious to further Australian nationalism within the British Empire, Parkes was typical of the Australian townsmen of his time, whose aspirations he voiced and even anticipated. Among his outstanding achievements were the education acts of 1866 and 1880 which established free, compulsory and secular education. He did much to insure a free trade policy in New South Wales when the other colonies went protectionist and was responsible

for a great deal of progressive legislation, including the Municipalities Act of 1867, which remained in force until 1905, and the Government Railways Act of 1888. The latter was intended to eliminate politics from the state railroad administration. Parkes was in accord with the popular antipathy to Chinese immigration and not only gave it a coherent theoretical basis, asserting that a vast increase in the Asiatic population would change the essential character of British Australia, but also promoted legislation restricting such immigration.

Tariffs, Asiatic immigration and Pacific policy were all-Australian questions and Parkes appreciated the need for federal machinery to deal with them. In 1881 he suggested an Australasian Federal Council. When it was formed in 1883 New South Wales did not join, but Parkes brought forward the larger idea of federation, for which he carried on tireless propaganda. Although his advanced years and the course of local politics prevented him personally from bringing his plan to fruition, his name is linked indissolubly with the establishment of the federal commonwealth.

E., *Life of Sir Henry Parkes* (Sydney 1896); Jose, Arthur, *Builders and Pioneers of Australia* (London 1928) p. 66-97; Spaul, G. T., *The Educational Aims and Work of Sir Henry Parkes*, New South Wales, Teachers College (Sydney), Records of the Education Society, no. 43 (Sydney 1920).

PARKMAN, FRANCIS (1823-93), American historian. Born of a distinguished and wealthy Boston family, Parkman spent the greater part of his life in New England. For most of his adult years he was an invalid suffering from partial blindness and severe nervous disorders which at times made sustained work impossible, so that the very completion of his history was one of his greatest triumphs. The romantic cast of his mind governed his choice of field. With Emerson and Thoreau he was deeply interested in nature; like Irving and Prescott, when he turned to history, he sought a remote subject characterized by high adventure, in his case the struggle of England and France to possess North America. He called his theme "the history of the American forest." Once romanticism had given him his subject, however, Parkman became a realist. He spared no effort to accumulate full data from source material scattered over two continents, displaying not only persistence but

unusual ingenuity in ferreting out the location of papers lost to sight. He trained himself in the technique of what was later to be called scientific history. He added travel to the investigation of documents and visited the scenes of the drama he was seeking to reconstruct. In Europe, in search of health, he sought for a prolonged period close contact with the Catholic church, so important in his story, in order to mitigate somewhat his New England prejudices. His most famous expedition, that to the Indians of the western plains where he studied aboriginal culture at first hand, resulted in *The Oregon Trail* (first published as *The California and Oregon Trail*, New York 1849) and gave Parkman a place beside Schoolcraft and Gallatin among the pioneers in American anthropology. In his study, working over the accumulations of his vast researches, his romanticism again expressed itself in a rich imagination which touched with life the past which he sought to recreate. Parkman's history of the rise and fall of French power in North America is one of the outstanding intellectual achievements of nineteenth century America. The separate volumes of this work, in the order of their appearance, were as follows: *History of the Conspiracy of Pontiac* (Boston 1851); *Pioneers of France in the New World* (Boston 1865); *The Jesuits in North America in the Seventeenth Century* (Boston 1867); *La Salle and the Discovery of the Great West* (Boston 1869); *The Old Regime in Canada* (Boston 1874); *Count Frontenac and New France under Louis XIV* (Boston 1877); *Montcalm and Wolfe*, 2 vols. (Boston 1884); and *A Half Century of Conflict*, 2 vols. (Boston 1892).

PARKS. The development of publicly owned and used parks is a relatively recent phenomenon. The cities of antiquity had their fora and market places; the nobility of Egypt and of Rome their hunting preserves; but the setting aside of open places for the use of all inhabitants was a practise which followed in the wake of indus-

trialization. Most of the early parks and gardens in Europe were associated with the seats of royalty and nobility. Constructed often on a grand scale of formal axial relationship about the palace or castle, they provided background for gorgeous functions of the court. As a rule the common people were privileged to use such parks and gardens only on special occasions or when the owner happened to have democratic leanings.

Changing ideas of city building first led to the introduction of public gardens and parks open to poorer classes and, with restrictions on their play, to children, but for long a park was regarded merely as a place for passive enjoyment and quiet. Increasing urbanization and industrialization in the nineteenth century not only made city parks more necessary—as offering relief to workers confined for long hours in buildings with poor lighting and ventilation, as play spaces in congested areas, and as aids in the purification of city air—but led to a new conception of parks as places for active enjoyment, sport and recreation.

In the United States the precedent for the provision of public open spaces was set by the early colonists. The commons in New England, like those in the mother country, were originally used for pasturing stock as well as for market places and drill fields; the plazas and pueblos in the southwest introduced by the Spanish and the parades and squares in the south laid out by the cavaliers from England were centers for community social life as well as for dramatic and musical events. These original public functions were gradually outgrown, but the open space idea was retained. The earliest development for outdoor recreation was a city park, the Boston Common, established in 1634. With the growth of towns in area and in density of population and with the consequent disappearance of adjoining woodlands the value of preserving or reclaiming areas of open space within the city came to be realized. The result was the landscape park. Such parks were developed in many of the larger cities of the United States during the nineteenth century: in New York City, Central Park with 843 acres, in 1853; in Boston, Franklin Park with 527 acres, in 1883; in Philadelphia, Fairmount Park with 2816 acres, in 1867.

As the limitations of such facilities were recognized, the combination of several types of park was seen to be necessary to the provision of adequate space for recreation. In 1892 a careful study made in Boston of the needs of the city

and its surrounding area led to the passage of constructive enabling legislation and to the setting up of a unified metropolitan park commission which became a model for other cities. A similar program for a unified system of parks, parkways and boulevards drawn up in anticipation of further expansion was initiated about the same time by Kansas City; another noteworthy park system was that initiated by the city of Hartford with the development of Bushnell Park in 1853.

Several influences effected a change in the character of parks in the twentieth century. Greater concentration of population attendant upon increasing industrialization brought a greater demand for facilities; at the same time the automobile made possible the location of parks in places formerly inaccessible. Municipalities acquired park reservations at some distance beyond their boundaries; while an impetus was given to the development of park systems by the larger governmental units. A park system had been begun in 1895 by Essex county, New Jersey, but the provision of parks by counties did not occur generally until considerably after 1900. By 1930 seventy-four counties had established parks. During the same period the states and the national government were increasing their activities in this sphere. The growing interest in active recreation, which led on the one hand to the campaign for children's playgrounds, was expressed also in a demand for neighborhood parks with facilities for tennis, baseball and football, swimming, boating and other sports. The large county, state and federal reservations were provided with camping sites, cabins and hiking trails, and streams and lakes were made available for fishing or swimming. Although the conception of a park as a landscape area did not disappear, it was realized that the preservation and conservation of natural beauty need not preclude active enjoyment and recreation.

A modern park system serves a great variety of purposes. The arboreta, the botanical and zoological gardens and aquariums to be found in many park systems, the natural history and art museums, outdoor theaters and music pavilions as well as the picnic grounds and sports areas afford opportunity for a considerable range of cultural and social activities. In the modern park system separate areas are generally developed to serve specific functions. The city square or circle serves chiefly as a decorative setting for public buildings or as a point of emphasis in the street vista. The well designed neighborhood park,

ideally a community center to be found within walking distance of every home, offers recreation for those of all ages, with playgrounds for children, athletic grounds for young people and quiet spots for the aged. The large park outside or at the outskirts of the city provides public golf courses, picnic grounds, swimming, boating and other facilities and should ideally be an area of natural scenic beauty, large enough to allow for extensive undeveloped territory. A well planned park system may also include a parkway—a connecting chain of specialized, elongated parks, ordinarily 200 feet or more in width, forming a means of travel by vehicle or on foot throughout a city or area. The express route type of parkway designed especially for automobile traffic, first developed by Westchester county, New York, promises to be an important model for the future. The park system is indeed a fundamental part of city and regional planning and involves attention not only to recreational needs but also to problems of traffic circulation and land use. Sound planning is often more feasible in suburban areas than in already overcrowded sections; while a further extension of the desire for adequate open spaces leads to the garden city.

In the development of parks local governmental agencies are most concerned with the provision of adequate recreational facilities. While state and national parks also serve this purpose, their chief functions are somewhat different. The preservation of areas of natural beauty, which although unevenly distributed throughout a nation are of interest to all its citizens, is essentially the province of a national government. In the United States the Yellowstone and Yosemite National parks, and the Chickamauga and Gettysburg National Military parks are representative examples of federal activity. Areas of less than national interest, such as those found in the Adirondack State Park, New York, the Palisades Interstate Park, New Jersey and New York, or the Custer State Park, South Dakota, may be considered proper objects for state development.

In the United States the federal government, beginning with Hot Springs (1832) and Yellowstone (1872), has developed 22 national parks, 75 national monuments and 12 other types of open spaces, having a total area of over 12,957,000 acres. Yellowstone, noted for its geysers, hot water springs and great canyon, remains the largest of the national parks, with 2,192,640 acres. The various states have established 578 state parks or equivalent areas, covering nearly

2,600,000 acres. Among the more notable state parks are the great wilderness park of Minnesota, Itasca Lake State Park, and Jones Beach, Long Island, only 34 miles from the heart of New York City but comprising 2245 acres, with 5½ miles of ocean beach.

In both national and state parks the primary purpose is to make available to the public certain exceptional natural features. Increasingly, however, here as in local parks, facilities are provided for camping and hiking, fishing, swimming and other activities which can be enjoyed by large numbers of people without injury to the natural conditions. The national and state governments and to some extent local governments have also been setting aside and developing forest areas which, while primarily for the conservation and development of existing timber and the reforestation of denuded areas under modern scientific methods, are open to the public for recreational activities of a character not inconsistent with their chief purpose.

Before 1850 there were no specific legal measures directing the establishment of parks or setting up forms of administration; nor was there in the entire United States any municipal park or recreation department. In the 1890's park commissioners and boards were set up in a number of cities. In recent years there has been a multiplication of agencies. The powers and duties of those charged with park administration are extremely varied in the legislation of the different states and municipalities and in that of the federal government. Administrative control of national or state parks is particularly apt to be scattered among various agencies, although the tendency is toward consolidation and concentration of control. Administration may rest in the hands of an individual, requiring all or most of his time and involving payment of a salary; on the other hand, members of park boards or commissions, varying usually from three to nine or more persons, are more often unpaid although reimbursed for actual expenses incurred. Whatever the administrative authority, it is usually charged with the planning, financing and acquisition of land and with the construction, operation and maintenance of the park or park system. Park boards are as a rule responsible to some legislative body or executive head and ordinarily retain an executive or technical director, empowered to employ a permanent staff and to hire technical consultants. The director frequently becomes the superintendent of operation and maintenance of the completed system.

Park financing is effected in various ways: through direct appropriations from general funds by the legislative body; through direct taxes levied for the purpose; and through bond issues, either sinking fund or serial or a combination of both. Frequently gifts of land and money from private sources have been of material aid in establishing and enlarging municipal, county, state and federal parks. In recent years park authorities have found that small fees charged for various types of services have, without restricting the use of the park, yielded a substantial return and in some cases actually met the maintenance and operation costs. A notable case is that of the Park Commission of Westchester county, New York, which during 1929 not only operated and maintained a great park system without cost to the taxpayers but also accumulated a surplus of \$39,000 for the year.

For the achievement of efficiency and economy in the development and management of parks there should be the closest cooperation between the park authority and the other executive and administrative agencies of the municipal, county, state or federal government. An important tendency which is becoming increasingly widespread is that toward the elimination of all political influence in park and recreational activity.

The provision of parks has come to be an accepted governmental activity. At the same time there have developed standards of what constitutes adequate park and recreation space, the generally accepted proportion in the United States being 1 acre for every 100 persons. A limited but growing number of cities measure up to this standard. Reports are available from 898 of the 1833 cities with a population of 5000 or more in 1930. Together these had 11,686 parks, with a total of 308,804 acres. Of these cities, however, 171 had no parks. Comparison of reports for 1930 with those for 1925 shows an increase in park acreage of 38 percent during the five-year period, with more than a doubling of acreage in cities with a population of 25,000 to 50,000. Three of the six largest cities of the country, New York, Chicago and Cleveland, more than kept pace with population growth in their park acquisitions during this period. Of the 898 cities reporting in 1930, 22 percent of the 93 cities having a population of 50,000 to 100,000 and 16 percent of the 124 cities with 25,000 to 100,000 inhabitants had at least 1 acre of park space for every 100 persons. The situation in a selected group of cities in 1930 is shown in the accompanying table

CITY	NUMBER OF PARKS	POPULATION PER ACRE OF PARK
New York	331	485
Chicago	228	566
Cleveland*	56	285
Boston	171	269
Hartford	27	61
Washington	658	114
Kansas City	70	116
Minneapolis	140	90
Dallas	61	42
San Diego	47	57

* It should be noted that some cities, such as Cleveland, which have small municipal park acreage are well provided with parks outside of city limits.

Source: National Recreation Association, *Park Recreation Areas in the United States, 1930*, United States, Bureau of Labor Statistics, Bulletin no. 565 (1932).

Industrialization and growing concentration of population raised the issue of the provision of public park space in England and other western countries also toward the end of the nineteenth century. In England the fight for the municipal park did not gather momentum until the 1860's, although as early as 1846 a city park had been established in Manchester and about ten years later Battersea and Victoria embankments had been laid out under national supervision in London. The inadequacy of the royal parks of London, to which the public had long been admitted, became more evident with the rapid disappearance of the commons under the pressure of rising land values, as areas formerly fit for nothing but grazing of stock or for sport were used for building and railway developments. The demand for the protection of the commons from such encroachments crystallized in the Metropolitan Commons Act of 1866, which with subsequent legislation empowered first the Metropolitan Board of Works and later the County Council to take over all commons and to purchase for park development additional lands within and beyond the city limits. By 1930 the London County Council had jurisdiction over 18,000 acres of green and open spaces, including 980 public play and recreation grounds. In Greater London the national government and the borough and urban authorities together maintained about 33,000 acres of open land to which the public had access. This represents, however, only 1 acre to about 600 people. Many of the smaller cities of England are even less well supplied with open spaces. The Town and Country Planning Act of 1932 was designed to remedy this condition both locally and nationally.

On the continent by the middle of the nineteenth century most of the larger cities had become aware of the need for open park spaces for their increasingly dense populations. In addition

to the parks established on former royal hunting grounds municipal zoological and botanical gardens were developed in almost every city of considerable size. German cities were most active in the distribution of small parks and playgrounds in congested districts; at the beginning of the twentieth century Berlin had about 100 such open spaces within the city limits. Paris not only had about the same number of small city parks but was the richest of the continental cities in total park acreage, with about 200,000 acres. Nevertheless, other French cities as well as most of those in Germany lagged behind British towns of approximate size and population.

After the World War park planning and development, spurred on by the physical culture and youth movements and by a new interest in town planning, were accelerated throughout Europe and particularly in Germany and in the city of Vienna. In the new republics of Austria and Germany and in Soviet Russia confiscated crown property was turned into public parks and gardens, while Cologne, Paris and other cities continued their pre-war schemes of transforming mediaeval ramparts and fortifications into beautiful boulevards and parks. Town planning schemes in German cities like Breslau and Leipsic provided for increased park and playground acreage; Leipsic by 1930 had a giant green throughout its entire length, consisting of 5700 acres and providing about $\frac{4}{5}$ of an acre to every 100 inhabitants. Most remarkable was the tremendous growth in the urban park and playground facilities of the U.S.S.R. At the beginning of the century Moscow had over 3000 inhabitants to 1 acre of park space; by 1933 parks of culture and rest had been established throughout Moscow, Leningrad, Tiflis, Odessa, Kiev and other cities, while in new industrial centers, like Dneprostroy, provision was made from the beginning for a green belt and sufficient park and playground space. Moscow parks in particular, with their "children's villages," their huge stadia, enormous playground space, provision for winter sports, houses of rest for week ends, solarium, library and other cultural facilities, exemplify new applications of modern theories of public health, child welfare and education.

The older and smaller countries of Europe have been unable to develop national and state reservations of large area, such as those in the United States, Canada, Hawaii, Argentina or Chile. Having few large virgin regions to protect, they have had to recreate original wild conditions. Most European national reserves were

designed primarily for the encouragement of scientific research, the foundation of agronomical laboratories or the establishment of museums for the preservation of living records of the evolution of plant life rather than for the maintenance of beautiful scenery or the provision of large recreational areas, although the latter objectives are sometimes given serious consideration.

The oldest and largest of the European national reservations are in Poland; perhaps in no other country are interests supporting the movement for their preservation better organized. Originally game preserves of Polish kings and of the Russian czar, they now serve mainly scientific purposes. Forest Bialowieza in Ecartom is the largest reserve in Europe and the only virgin forest of considerable size on level land, part of which is open to the public as a general park. It and the other reservations are supported by the national budget under the jurisdiction of the National Commission for the Protection of Nature in the Ministry of Religious Worship and Public Instruction.

In many countries reservations have been established by private societies, which alone or with the cooperation of the state then supervise their administration and direct activities connected with them. One of the earliest of such societies, the Schweizerische Bund für Naturschutz, was organized in 1909 and by 1927 had a membership of 30,000. It was influential in the establishment by the Swiss government of the 67-mile tract in the lower Engadine in east Switzerland as a reserve for scientific research. Another early scientific society, the Dutch Society for Preservation of National Monuments, founded in 1906, purchases and leases land for reservations; in 1929 it had thirty such plots, comprising 13,832 acres. Two important national parks were established in Italy after the World War, the Gran Paradiso National Park in 1922 and the Abruzzi National Park converted from a hunting estate in 1923 to serve scientific, educational and recreational purposes. Both are administered by a general commission under the Ministry of Agriculture. National parks have likewise been established in Denmark, Sweden, Bavaria, Bohemia and Spain; a large project is under way for two adjoining national parks on the boundary between Poland and Czechoslovakia. A unique proposal is that for British national parks in Africa, which would not only preserve wild animal and plant life but control their development as part of a public health program.

The increasing leisure time available to the great masses of people in the modern world is but one factor in the growing awareness of the importance of parks to general welfare. In a sense the provision of park recreation constitutes a form of investment and insurance for a nation as well as a guaranty of happiness for the individuals comprising it. Adequate park development is becoming more and more closely bound up with comprehensive city and regional planning, based as it is upon recognition of modern social and economic needs and upon coordinated public action. So conceived it ministers to the health, the moral standards and the cultural growth of community and state.

PARNELL, CHARLES STEWART (1846-91), Irish politician. On his father's side Parnell came of English Protestant landlord stock which since the seventeenth century had produced a poet, a baron and numerous Irish political and legal functionaries. His mother was a daughter of Commodore Stewart of the United States Navy. Educated at Cambridge and elected to Parliament in 1875 as a follower of Isaac Butt, Parnell became associated with a group of political adepts who were bent on obstructing parliamentary action in order to obtain concessions for Ireland. Although he opposed physical force and agrarian outrage, Parnell was induced by Michael Davitt to accept American physical force money for parliamentary agitation as well as to sponsor the Land League. Charged by the government with attempting to thwart the operation of the Land Act of 1881, Parnell was arrested and lodged in Kilmainham jail. The murder of two British government officials in Phoenix Park, Dublin, shortly after his release in 1882, so disheartened Parnell that he withdrew temporarily from public activity, solacing himself with scientific pursuits. He was recalled to action by the pivotal position of his party after the election of 1885 and negotiated with both English parties until in desperation Gladstone sponsored the first Home Rule Bill of 1886. When this momentary triumph had been swept away in the election of that year, the Irish party paid for its exaltation of the individual by suffering eclipse with him. Even before parliamentary investigation had had time to clear him of the charges based on the forged letter in which he was purported to have condoned the Phoenix Park murders, the O'Shea divorce suit naming Parnell as co-respondent was under way. Torn between the ignominy of pulling down the idol they had created and the difficulty of outfacing

liberal Protestant morality before a Catholic country, the majority of his colleagues unhesitatingly deposed their leader. At its zenith Parnell's prestige had been used by Davitt to advance a work on which Parnell had not set his heart—the reordering of Ireland's agrarian system. When his prestige was at its nadir the Irish political movement became dependent upon the politically moribund Gladstone, and the Unionists were permitted to solve the agrarian problem on their own terms. The avowed goal of Parnell's ambition—local political autonomy for Ireland—had to wait for other times and other men.

PARRINGTON, VERNON LOUIS (1871-1929), American literary historian. Parrington spent his formative years in the middle west and while a student at the College of Emporia in Kansas, during the agrarian discontent of the 1890's, openly championed the cause of the Populists. These sympathies were intensified by two years of postgraduate work at Harvard, where Parrington found the "genteel tradition" unsatisfying and artificial. In his teaching at Emporia and the University of Oklahoma, however, his training in English literature and his preoccupation with aesthetic problems tended to obscure his earlier social interests. It was not until 1908, after he had become a member of the faculty of the University of Washington, that these were revived; and profoundly dissatisfied with the usual belletristic or chronological survey of American literature, he now set himself the task of writing a new history which was to exhibit literature as growing out of a social context.

Parrington found inspiration for the synthesis he was contemplating in Taine's critical method. Even more important perhaps was the encouragement he received from his colleague J. Allen Smith, who was a pioneer in the economic interpretation of American political theory. Parrington's studies led him to the conclusion that the pattern of American life was formed essentially by the impact of a new world on an old world culture; this in turn gave rise to

two native tendencies, the one democratic, agrarian and decentralizing, the other conservative, capitalistic and centralizing. In brief much of American development could be read in terms of a struggle between Jeffersonianism and Hamiltonianism; this hypothesis, which was basic to the work of the historians Frederick J. Turner and Charles A. Beard, Parrington sought to apply to his examination of the intellectual and sociological content of American literature.

The result was a literary history notable not only for its keen evaluation of social and economic forces but for its treatment of neglected aspects of writers like J. F. Cooper and for its attention to the poets and novelists of the south, who had been largely overlooked. It is true that Parrington's progressive and agrarian sympathies are evident in his judgments; but it can scarcely be said that his viewpoint militates against the accuracy of his work. The first two volumes of *Main Currents in American Thought* (New York 1927), which won the Pulitzer prize for American history, went as far as 1860. The third volume, which Parrington's death in England left unfinished, was nevertheless sufficiently written and outlined to be published as an indication of his complete intention (New York 1930).

PARRY, DAVID MACLEAN (1852-1915), American manufacturer and leader of the open shop movement. Born on a Pennsylvania farm, Parry led a varied career as salesman, journalist, lawyer, chain store merchant, manufacturer and director of banking and public utility corporations. The numerous strikes from 1898 to 1903 and the corresponding growth of trade unionism and socialism led Parry to conclude that capital must organize to meet the challenge of organized labor. He believed that organized labor and its demands were absolutely antagonistic to the principles of an individualistic social order and rejected conciliation as "an attitude of compromise with regard to fundamental convictions." Individualism he interpreted to mean the right of employers to conduct their businesses "untrammelled by the many petty exactions" of "un-American unionism" and

he was unswervingly opposed to strikes and to labor and social legislation. As president of the National Association of Carriage Builders, the Indiana Manufacturers' Association and the Citizens' Industrial Association of America, of which he was one of the founders, Parry conducted a belligerent struggle against trade unionism. His activities culminated in the successful effort, aided by John Kirby, to convert to his policy the National Association of Manufacturers. During his presidency of this association from 1902 to 1906 Parry transformed it into the vanguard of the open shop movement, a bitter antagonist of trade unionism, which helped to break many strikes, and an organizer of a powerful lobby against progressive legislation. Under his leadership the association grew rapidly, and it was he who was largely responsible for the formation and coordination of similar employers' associations. Believing that the middle class frequently plays a decisive part in labor disputes, Parry tried to arouse it as well as the working class against the "dangers" of trade unionism and socialism, and distorted the character of both movements. His tactics antagonized many non-labor elements which favored collective bargaining; and in 1913 a congressional investigation condemned the lobbying activities of the National Association.

PARSONS, ALBERT ROSS (1848-87), American labor leader and "anarchist martyr." Parsons was born in Montgomery, Alabama, of prerevolutionary New England stock, was orphaned at the age of five and reared by a brother on the Texas frontier. He joined the Confederate forces in the Civil War when he was but thirteen years old and after serving four years returned to Texas, was apprenticed to a printer and in 1868 founded a weekly Republican periodical, the *Waco Spectator*.

From 1870 to 1873, when he moved to Chica-

go, Parsons held a number of political offices in Texas.

During the depression of 1873-78 he worked as a printer in Chicago, becoming increasingly interested in economic problems and in the numerous programs of the rising labor movements of the time. He joined the typographical union, helped to found a branch of the Knights of Labor and became a member of a socialist party in 1876. A year later, when the socialists met with a fair degree of success in political campaigns in and about Cook county, Parsons ran for office but was not elected. From the railroad strikes of 1877 he emerged a popular orator and a leading American socialist agitator. In 1879 he became secretary of the Eight Hour League in Chicago, then the center of revolutionary activity, and in 1881 after the split within the socialist party he joined the left wing, which helped to organize the American section of the Anarchist, or "Black," International. As editor of the revolutionary *Alarm* from 1884 he carried on a successful agitation among English speaking workers for direct trade union as against political action and in contrast with the German revolutionaries was one of the aggressive leaders in the nation wide eight-hour demonstration of May 1, 1886.

He was one of the speakers at the meeting on May 4 called as a protest against the killing of strikers at the McCormick Harvester Works, but he had been absent from Chicago the previous day when the *Alarm* published the call for the meeting at which a bomb was thrown, killing seven policemen. After going into hiding for a brief time Parsons surrendered, was indicted for murder with seven other anarchists, among whom he was the only native born American, and on November 11, 1887, was hanged with three of them—August Spies, Adolph Fischer and George Engel. The fifth man sentenced to death, Louis Lingg, committed suicide in his cell. Parsons' contention that these men were condemned not for murder but for being anarchists and for fighting against economic injustice was sustained in Governor John P. Altgeld's scathing review of the prosecution in 1893 which resulted in the pardoning of the remaining three men.

PARTIES, POLITICAL

THEORY. A party, in the most general sense of the word, is a body of persons who are united in opinion or action, as distinguished from or opposed to the rest of a community or association. Parties therefore are classified in the first instance in accordance with the kind of community or association to which they belong. Political parties are those which belong to states or municipalities. They are distinguishable from other kinds of parties by the nature of the purposes of states and municipalities. They differ from ecclesiastical parties, for example, as states differ from churches. An ecclesiastical party might seek to influence political affairs and a political party might seek to influence ecclesiastical affairs without destroying the essential nature of the parties. It is not the immediate object of partisan activities that determines the general nature of a party but the purposes of the state, church or other association which is divided into parties. Particular political parties do of course gain their individual character from the special purposes of their members, both leaders and followers, and consequently reflect the special conditions under which the government of particular states or municipalities is conducted and the transitory circumstances of the struggle for power. In short, a political party may be more precisely defined as one of the parts into which a state or municipality may be divided by questions of public policy or elections of public officers.

A distinction is often made between parties and factions. It is not clear, however, that there is any essential difference between them. Formerly, when all parties were under suspicion, as when Washington uttered the familiar warning against the dangers of partisanship which appears in his *Farewell Address*, the two words were used indiscriminately. In modern times, since parties have been accepted as indispensable and hence justifiable divisions of well governed states, factions have often been regarded simply as the more pernicious or less useful kind of parties. More logically a faction has been defined as "any constituent group of a larger unit which works for the advancement of particular persons or policies." This suggests that factions are divisions of parties, as parties are divisions of states. Thus the progressive and conservative Republicans or the gold and silver Democrats, once familiar expressions in American politics, were presumably factions within the two major parties. But it is not always so

easy to distinguish between party and faction. Are the various socialist and communist parties, for example, which have participated in American presidential campaigns in recent years, independent parties or factions within one general although loosely organized labor party? More explicitly, is the Socialist Labor party a party or a faction? The British Labour party is doubtless a true party, but is the Independent Labour party a party or a faction? Again, parties may cooperate for the further advancement of their candidates and measures and political associations may result, such as the Weimar and Harzburg coalitions in Germany or the *cartel des gauches* and *bloc national* in France. In these cases the smaller units are the better organized and more durable, and custom sanctions their claim to the name of parties. On the whole, faction seems to be a word more appropriate for an organization of inferior dignity as well as smaller size; and the boundary between factions and minor parties is one to be determined by convenience rather than by logic.

There is no uniformity in the party systems of modern states. In all states with representative forms of government parties exist both in the governmental bodies which represent the people and among the people who choose the representatives. Sometimes, as in France, the parties in the representative bodies do not exactly correspond with the parties among the voters. Generally the popular and legislative parties are the same. They vary greatly in different states in number, durability and importance. In many states there are only two or three parties of major importance in the legislative bodies, although there may be others of minor importance. This is the rule in the English speaking states. In other states, particularly the parliamentary republics and monarchies on the continent of Europe, the number of organized parties is much greater. In several of these states the number of parties represented in parliament has exceeded a dozen, and in Poland it has been as great as twenty. In a few states a single major party dominates the government and other parties are either excluded altogether from any share in the conduct of public affairs or, if permitted to function, play only a minor part. In Italy, for example, the government is so organized that the Fascist party possesses a practical monopoly of political power; in Hungary, on the other hand, although there is only one major party, which has controlled the government since the overthrow of the Communist

dictatorship under Bela Kun, minor parties continue to be represented in parliament. This system by which a single major party controls the government with or without toleration of minor parties is so different from other party systems, in which two or more parties struggle for power, and is so important in the modern world that it must be regarded as a distinct kind of party system. Other party systems may be conveniently divided into two separate classes: the systems in which two major parties contend for the control of the government upon fairly equal terms; and the systems in which a greater number of parties join in the struggle for power on such terms that none of them by itself can ordinarily expect to control the government.

The single party system is an instrument of dictatorship. Besides Italy the principal states in which there is only one recognized party are the Union of Soviet Socialist Republics, Turkey and China. In these states the Communist party, the People's party and the Kuomintang, respectively, keep their leaders at the head of public affairs and tolerate no partisan rivals. Stalin, Mustafa Kemal and Chiang Kai-shek like Mussolini have been successful dictators because they were powerful party leaders. Military reputations were also helpful, where available; but Mussolini could derive little help from his military reputation and Stalin began with no military reputation. Besides Hungary other states in which at present there is only one major party, although minor parties are also represented in parliament, are Poland, Rumania and Jugoslavia. Poland must be included among these states, since Marshal Pilsudski has succeeded in building up a government party with a clear parliamentary majority, despite the multiplicity of opposing parties. Germany under the Nazi-Nationalist coalition may also be added to this list. In Jugoslavia a royal decree of September, 1931, ordering the election of a new parliament expressly prohibited all the old parties which had existed in that country before the dissolution of the previous parliament, as well as new parties organized on racial, religious or class lines. If this decree should prove to be something more than a desperate effort to perpetuate a discredited dictatorship, the Jugoslavian party system would become one of the Italian rather than the Hungarian type. Other important states in which those who control the government generally belong to a single party are Brazil and Mexico. In all these states the government of the party supplies the active ele-

ment in the government of the state itself, and party leadership is inseparable from public dictatorship.

In modern times, in consequence of the growth of popular respect for law and of public dependence upon the uninterrupted operation of the public services, the foundation of the authority of rulers upon the good opinion of their subjects has become increasingly important. Enlightened dictators, although they may obtain their power by fighting, do not wish to fight more than is necessary to retain it. Four centuries ago Machiavelli argued convincingly that dictators, while maintaining sufficient force to secure their power, should make every effort to build up a body of unconstrained opinion favorable to their rule. In the establishment of dictatorships the organization of parties reinforces or even replaces the appeal to arms. Plebiscites may be as decisive as battles; general strikes as terrifying as insurrections. Plebiscitary dictatorships were first popularized by the Bonapartes, who discovered the secret of confusing the reign of law with the personal rule of masterful men. The followers of Karl Marx, noting how the bourgeoisie had checked the power of the sword by that of the purse, undertook to check both by the organization of labor. But a dictatorial plebiscite is a cruder instrument than a Fascist party, and a communist party is indispensable for a dictatorship of the proletariat. There can be no question of the superiority of these partisan dictatorships over the dictatorships which have been established in recent years by military force alone. Yet these single party systems all seem transitory and ephemeral. To endure, a dictatorship must be transformed into either a monarchy or a republic. In either case new parties will spring up or the old will split into pieces. Eventually success will ruin a dictatorial party as surely as failure.

The double party system was formerly a great favorite of the political theorists. Two major parties, they said, which contend for power on fairly equal terms, afford the best security that a representative government will actually be carried on with the consent of the governed. Each party may adopt a set of principles and pledge its leaders to the conduct of public affairs upon those principles. The voters may then choose between the two, and the candidates of the party which gains a majority of the votes will occupy a majority of the offices. Thus the government will fall into the hands of men who are pledged to operate it upon principles which

the people have endorsed. Such was the system supposed to have been established in England following the great revolution in the seventeenth century and to have flourished during the two succeeding centuries, when British parliamentary institutions presented to the world a model of representative government. Such a system was in the mind of Burke when he defined a political party as "a body of men united for promoting by their joint endeavours the national interest, upon some particular principle in which they are all agreed."

But the practise in states where the double party system has prevailed has not conformed to the theory. The two major parties have had principles, but the principles have tended to be the same. If they had not been substantially the same, submission to the victor would have been intolerable to the vanquished. In the United States, as Jefferson with little exaggeration declared in his first inaugural address, the people were all Republicans and they were also all Federalists. The present Republican and Democratic parties are both democratic-republican parties. In Canada Liberals and Conservatives alike wish to conserve certain ideas and ideals and to liberate others from existing inhibitions and restraints. In Great Britain likewise the two great historical parties, during the periods when they really contended for control of the government on equal terms, were agreed upon fundamentals. Otherwise His Majesty's Opposition, as the phrase ran, could not have lived harmoniously with the party in power.

The double party system has worked well only when the circumstances have been specially favorable. It has been essential that the bulk of the people should be agreed upon the general principles of the constitution and the vital policies of the government and should not feel too intensely about measures over which they disagreed. The British Tories were excluded from the government for many years, until they became reconciled to the house of Hanover; and the double party system broke down in the United States when the struggle over slavery approached its climax. In matters of minor importance there may be numerous differences between the parties; but since in large states there are many such matters, it can rarely happen that the voter finds himself in complete agreement with either of the parties. The party alignment is obscured by the confusion of issues, and the decision at the polls may decide little more than the possession of the offices. The

voters can determine whether those in power shall stay in power or yield their places to their rivals. The determination of public policy continues in the hands of the officeholders, while the members of the public remain the spectators of the process of government. Special interests strong enough to attract substantial groups or classes of voters may become identified with one or the other of the parties, and the struggle for power may involve the fortunes of such groups or classes as well as those of particular candidates for office. But in that case the struggle between the parties becomes a clash of conflicting interests rather than a competition of principles, and the will of the majority a triumph of private rather than public purposes. The double party system is doubtless a convenient system for contented peoples, but it is not an efficient system for the expression of public opinion when the variety of opinion and intensity of conviction are great.

The multiple party system is an instrument of government by coalition. Since no one party can ordinarily expect to secure a majority of the seats in the representative body, no one group of leaders can expect to carry on the government without the collaboration of other groups. If a majority is to rule, it must rule by means of combinations and compromises between competitors for power. If the executive of the state is independent of the legislature, majorities may be secured for its measures by means of temporary coalitions. If the active executive is dependent upon the legislature for its continuance in office, as in the states with cabinet government and responsible ministers, coalitions must be formed to support a general program rather than particular measures. Coalition government presents some manifest disadvantages as compared with the double party system. It has less prestige, because its mandate comes from the various parliamentary groups which form the coalition instead of directly from the people, as is the case when a party comes into power under the double party system. It is really less powerful, because its leaders possess less unity of purpose than the leaders of major parties. It is also less durable, because coalitions are more unstable than parties. On the other hand, it is more flexible, since it can be dissolved and reorganized without a fresh election. It is more favorable to deliberation, since its component groups have more opportunity for reflection than the supporters of a rigidly organized major party government. It is more responsive to pub-

lic opinion, since its components have greater freedom of action than the members of a single party. Under favorable circumstances these advantages seem to outweigh the disadvantages. The government of France under the Third Republic has often been compared unfavorably with that of Great Britain during the same period. During the World War, however, when both governments were subjected to an extraordinary strain, the French government functioned with less deviation from its normal processes than the British. Long under suspicion by political theorists as well as by many of its own people, both because of its many departures from the British model and because of the uncertain future of the republic itself, the government of the Third Republic was better than it seemed. Coalition government has on the whole served the French people reasonably well.

The general preference for multiple party over double party systems on the continent of Europe since the World War was doubtless encouraged to some extent by the comparison of party government in Great Britain with coalition government in France. Yet circumstances clearly favored the French rather than the British system. In the new states which came into existence after the war as well as in most of the old ones where revolutions occurred, there were an unusual variety of political opinion and extraordinary intensity of conviction among those affected by the shifting of political power. It was not practicable to express the opinions of the various groups of voters through the rigid forms of the double party system. Methods of election favorable to the multiplication of parties had been in general use before the war in most European states, and after the war such electoral methods continued in favor. Systems of proportional representation, the most favorable method for the multiplication of parties, were widely adopted and the right of parties as well as of persons to be represented in the conduct of public affairs was explicitly recognized. In Great Britain also circumstances became less hospitable to the double party system. Even before the war the growth of the independent Irish Nationalist party and of the Labour party had compelled Liberal cabinets to rely upon coalitions for their continuance in power or to govern by the tolerance of partisan opponents. Since the war the double party system has broken down at two general elections. In the self-governing dominions, where the double party system formerly prevailed, similar complications

have arisen and in the Irish Free State the framers of the new constitution deliberately favored a multiple party system by the adoption of proportional representation. Although in several of the European states which encouraged the multiple party system after the war parliamentary government has subsequently given way to dictatorship in some form, the manifest defects of the multiple party system seem to have been less responsible for the rise of dictators than the lack of agreement among the peoples upon fundamentals, the political strain of the peace treaties and economic depression. Even in Great Britain efforts were made on two occasions, in 1915 and again in 1931, to supplant the double party system by a national coalition, a mild form of dictatorship.

It is evident that the characters of political parties are determined by a multitude of considerations relating to the policies of states and the methods of electing public officers. It is also evident that the more numerous the parties in any state, the more clearly defined are their particular characters. In states where the multiple party system exists there are religious, nationalistic, economic class and even personal parties. The Catholics are separately organized in a majority of the non-dictatorial parliamentary republics and monarchies of continental Europe, and in a few of these states there are also independent Protestant parties. The workers and peasants also have numerous separate organizations, the Social Democrats being represented in all these states and the Communists and sundry agrarians in most of them. Both nationalist minorities and nationalist majorities have numerous parties of their own, the latter forming generally the dominant influence in the dictatorial parties. To segregate the special influence of nationalist and economic class interests is difficult. In the states with double party systems it is impossible. In party systems of this type the interests of the dominant economic class become so identified with those of the dominant race or nationality that the important special interests within a major party are likely to be geographic (sectional or regional) or industrial. Such is the case, for example, in the United States, where the double party system is most strongly established. In Canada, on the other hand, where geographical influences are strong, religious and racial interests also are leading factors in the party alignment. In general, the less numerous the parties in any state the more important is the form of government within the

party. In the single party states the form of party government may be even more important than the form of government of the state itself, since the party dominates the state. But in such states partisanship masquerades as statesmanship and the theory of political parties merges into the general philosophy of politics.

ARTHUR N. HOLCOMBE

ORGANIZATION. The concept of party organization refers to the inner core of a political party—the leaders and the rank and file of the militant adherents who can be counted upon to carry on the routine work in the winning and maintenance of political power. Under two-party or multiparty systems, allowing freedom of association and expression, the party organization must select candidates for public office, determine party issues, raise party funds, electioneer, bring the voters to the polls on election day and conduct or criticize the government. It must include persons who are trained and willing to perform such tasks as canvassing, distributing literature, arranging political meetings, directing publicity, looking after the technical details of the election process, organizing legislative assemblies and managing administrative offices. The leaders and workers may be fired with sacrificial zeal or they may receive material rewards for their services. Under a dictatorial single party system the tasks of the organization are centered rather on the suppression of opposition, the maintenance of contact with the masses, the creation of favorable mass attitudes by propaganda, the raising of the general morale of the masses, the leadership in the performance of civic tasks and the formulation of plans for social and economic reconstruction. But both in a democracy and in a dictatorship a party organization proper is always a small fraction of those who support or tacitly accept the guidance of the party.

The rules for membership in a party organization are most rigid in those political movements which have established dictatorial powers, like the Russian Communist party, the Italian Fascist party and the German National Socialist party. Membership in these parties carries special privileges and duties and is greatly sought after. Following the Russian model, extreme care is taken in the admission of new members, and the old membership lists are constantly purged of those suspected of disloyalty to the leaders in power. Admission into a party like the Russian Communist party is preceded by a

period of probation, and the candidate must be sponsored by party members in good standing. Communists and Fascists alike emphasize the recruitment of new members from their respective youth organizations. Candidates for membership must pledge their personal loyalty to the leader in power, they must be thoroughly familiar with the party dogmas and they must be willing to sacrifice time and material goods in the service of the party.

In democratic countries the parties with the most rigid membership rules are the socialist, communist, labor and Catholic parties. Adherence to the party principles, payment of party dues and membership in the appropriate auxiliary organizations of the party are the usual requirements demanded of those who wish to remain on the party rolls. The socialist and communist parties are the most successful in making effective the requirement of the regular payment of contributions. In the case of labor parties, such as are found in Great Britain, the British dominions and Belgium, membership in the trade unions affiliated with the party carries with it membership in the party itself and the party dues are collected for the most part by the trade unions. In some of the Catholic parties, like the Belgian Catholic party, the Swiss Catholic Conservative party and the German Center party (before 1933), the members in agricultural regions are organized in peasants' unions and the members in industrial sections in Christian trade unions. Labor and Catholic party organizations are frequently federations of regional and class associations.

Non-socialist and non-confessional parties in democratic countries are usually very loosely organized with few or no formal rules regulating membership. Most of the major parties in English speaking countries tend to cut across class lines and include in their membership persons with widely divergent views on social and economic questions. Only rarely are dues required of those who belong to local party clubs or associations. The bonds which unite the members of such parties are vested interests in a given economic and social system and expectations of political power. It is as easy to join one of the major parties in the United States as one of the older British parties, but in the United States party membership has been brought partially within the scope of the law. In order to participate in a primary election at which party committeemen are elected and party candidates nominated, the individual must in most states either

be enrolled as a voter of a given party or prove that he has not voted in the primary of some other party within a specified period of time. In the southern states the rules regulating party membership are usually made by the party committees, which have virtually excluded Negroes from participation in the primaries. Two Texas laws which attempted to restrict the primaries to whites were declared unconstitutional. Except for these efforts at racial discrimination, the major parties in the United States have placed few barriers in the way of those applying for affiliation.

The work required to maintain a successful political party is so heavy that it has been necessary in all countries to establish party bureaucracies. The party hierarchy may be composed largely of public officeholders or office seekers, as in the United States; of salaried election agents, as in the older British parties; of key men in the economic, military and political institutions in a dictatorship; or of trade union secretaries, cooperative officials or peasants' union agents in a class party. While varying widely in structure, all successful party bureaucracies take care of every unit of government from the smallest to the largest. In his study of continental socialist parties Michels has pointed out the inevitable development of oligarchies even within the proletarian parties. He finds the principal cause of oligarchy in these parties to be the technical indispensability of leadership. A customary right to the office of delegate is established; the leaders become professional and stable; and principles of authority and discipline, resembling those characteristic of the state, are fixed within the party.

Party leaders are recruited from the party members in legislative bodies, from the active party organizers outside the government, from the party journalists and orators, from the affiliated party organizations, from those who occupy or who have occupied civil or military positions and from the business and professional men associated with the party. In parliamentary countries the most successful legislative debaters, committee members and cabinet executives emerge as party leaders. The control of the parties is centralized in the hands of the parliamentary leaders, who pass upon nominations, manage the party funds and determine the party policies. In the case of labor parties this control of the parliamentary leaders may be divided with the trade union leaders. In countries having party dictatorships the leaders arise out of the

stress of the revolutionary situation and the exigencies of social reconstruction. Where the presidential or congressional form of government prevails, party leadership is divided and may develop in a variety of ways. In the United States the president, the ex-presidents, the defeated presidential candidates, the party leaders in Congress, the national, state and local committees, the governors, the party leaders in the state legislatures, the mayors of important cities and the party bosses share the leadership of the political parties. Unified party control even for limited objectives is attained only on rare occasions, and even then there are dissensions which can readily rise to the surface. Under American conditions the development of party leadership is not systematic. State governors, cabinet officers, congressmen or business men may emerge as party leaders upon occasion. Such constitutional devices as the separation of powers, the federal system and the guaranties of local self-government retard the establishment of centralized party control.

One of the prime requisites of any party organization is the ability to secure funds for promotional activities and propaganda. Parties which have a strong theoretical foundation and appeal to the imagination of a determined minority may rely to an extent upon volunteer services, but activities requiring printing, office space, auditoriums, loud speakers, sound motion pictures and other technical equipment demand huge outlays of money. In raising funds a party may incur obligations which compromise its effectiveness as an interpreter and defender of mass interests. Plutocratic influences may thus come to dominate a party which ostensibly appeals to the masses. In democratic countries like Great Britain, France and the United States many of the large contributors to campaign funds are public spirited men who expect no concrete reward for their gifts to the party, but there are others who look for a return upon their investment. In all these countries the single member district system facilitates the nomination of wealthy candidates who are willing to pay their election expenses. In the United States business men desiring tariff favors, utility magnates seeking to escape public regulation, tax dodgers, gambling house keepers, bootleggers and others with more or less sinister aims are anxious to place the party organizations in their debt. While the relationship between party funds and the honors system in Great Britain is shrouded in secrecy, it is clear that many persons

elevated to peerages have been heavy contributors to party funds. In France corporate contributions and purchased newspaper support are subjected to criticism from time to time. In republican Germany banks, corporations and large landowners supported generously the parties of the right, including the National Socialists. In democratic countries labor parties are financed frequently out of trade union funds, which means that the trade union leaders exercise important powers over the party organization. Socialist parties following the model of the German Social Democratic party as it existed before 1933 rely almost entirely upon party dues. An elaborate collection system is worked out and stamps are issued to those who have fulfilled their obligations. This is the most democratic form of party financing yet devised, but non-proletarian parties have had little success with it. A few revolutionary parties have secured financial assistance from abroad. The Irish *Fianna Fail* has been aided by funds from American sympathizers. It is widely believed that the Third International assists Communist parties in various parts of the world, but the existence of gold in Moscow which could be used for these purposes has been shown to be legendary.

The problems of party discipline vary with the type of governmental institutions. In parliamentary countries the main problem of party discipline is to secure united action in the legislative body. The government and opposition parties in Great Britain have shown a high degree of cohesiveness, and since the advent of Labour as the second largest party the cleavage between the two leading parties has been sharp. Discipline is maintained by reason of the supremacy of the leaders who direct the party whips, control the central offices which administer the party funds and pass upon the nomination of candidates. Party discipline is much weaker in the French Chamber of Deputies than in the British House of Commons, but it is stronger than in American legislative bodies. An examination of votes in the Chamber of Deputies shows that the parties of the right and the left are most cohesive. In the Reichstag of republican Germany the party delegations were highly disciplined because of the system of binding party lists. The voters had no voice in the selection of candidates and the party leaders could recall recalcitrant members and replace them with others. Party discipline for the ruling group in dictatorial governments involves a different set of techniques. Members in responsible positions are carefully watched, and

considerable severity is shown toward divergences from the established party position or toward the abatement of party zeal.

The close relation which the modern state establishes between parties as political organizations with general aims and the particular associations and interest groups involves a problem of considerable gravity. In countries with representative institutions attempts have been made by legislation to limit the influence of money in elections. Publicity regarding campaign finance, the prohibition of particular election practises, and the limitation of total expenditures have been among the devices employed. While legal regulations are helpful, they will not in themselves solve what are inherently problems of the struggle for political power.

HAROLD F. GOSNELL

UNITED STATES. The forms of party institutions in the United States have been shaped largely by the interaction of certain features of governmental structure, but the energies flowing through these forms have been coextensive with the total operative social forces of the country. The system of separately elected state executives, capped by the presidency, has disposed political groups toward a two-party alignment. The federal principle, extended in effect by the widespread election of local officers, has decentralized party organization. The detailed statutory regulation which has become so markedly characteristic of party government in the United States has subjected the affairs of ostensibly national entities to the disparate though imitative legislation of forty-eight states. Through forms thus conditioned a spirit of controversy has operated which has been part of the strains accompanying two great processes—the peopling of a nearly empty continent and the uneven, still incomplete, advance of industrialization.

Considered nationally political parties in the United States may be described as loose alliances to win the stakes of power embodied in the presidency. The centripetalism generated by this office more than any other factor discouraged the development of the multiplicity of parties anticipated by the founders of the constitution. So far as the draftsmen of 1787 revealed their thought regarding this crucial aspect of government upon which the fundamental law was silent, they seem to have held this assumption. James Madison, writing in number ten of the *Federalist*, argued that safety would result from the process of cancellation and compromise

among the numerous political groups sure to be engendered by the various kinds and degrees of property. On the formal side this forecast missed the course upon which politics almost immediately entered. In essence, however, his expectations have been realized; diversity, balance and concession (with the immediate security and the long run dangers which attend deadlock and inertia) have been provided at most periods in American history by factional divisions within each of the two country wide organizations.

The reflexes of presidential government have been paradoxical. On the one hand, it has invited multiplicity, for it has freed legislative bodies from the impulse toward combination involved in creating and maintaining administrations. On the other hand, centrifugal tendencies have been offset by the fact that in the face of the necessity of choosing a single candidate the alternatives open to electorates have been sharply narrowed. Marginal groups, which might otherwise have given rise to separate parties, have seldom been able to resist the temptation to aid in choosing the lesser evil. There has been a further seeming inconsistency. In its relation to politics generally the separate choice of chief executives has had both an energizing and a weakening effect. The almost revolutionary potentialities which reside in offices of such scope were illustrated when a presidential election precipitated the Civil War. But the system has not encouraged effective party rivalry, let alone the equipoise of government and opposition. The post of president or even of governor possesses incalculable sentimental advantages. The party which does not hold it is weakened by lack of a comparable focus and by the discontinuity of political leadership. The practise of politics therefore has refused to conform to the ideal of two evenly matched parties which has been drawn largely from the conditions of British public life in the nineteenth century, although the nearly universal acceptance of this ideal in the United States has doubtless helped in some slight degree to maintain the two-party system.

The emphasis properly laid upon the presidency in an explanation of the development and persistence of two parties does not deny the role of other factors. In all countries seeking to base popular institutions upon the majority principle the practical need for organization in order to gain and hold power contends with the interplay of numerous interests and issues. Combination is encouraged by two very different sets of

circumstances: under conditions which approximate revolution, when the maturing of a transcendent controversy subordinates lesser questions; or when opinions are so lightly held that they do not interfere with the realistic arts of co-operation through barter. The latter situation has been prevailingly characteristic of the United States. Intransigence has not been its mood. In view of nearly universal lip service to the constitution the rallying points of dynastic loyalty have been absent. In a new country fed by immigration class lines have been blurred and the preoccupations of race and religion, although insistent and influential, have taken forms which inclined them to action through inclusive parties rather than in isolation. Large scale business methods, catering through mass production to a standardized market, have strengthened the attitudes which have caused voters in the United States to find pleasure in affiliation with vast if amorphous political associations.

A real two-party division moreover was induced by the existence of two major complexes of interest in the country. A long standing opposition prevailed between independent farming and the mercantile and financial activity out of which industry grew. This conflict was the common feature which related, in an essentially unbroken alignment, political division in the colonies, the split in opinion regarding the adoption of the constitution, and the cleavage in national politics during the following century.

The first decade after the constitution brought the consolidation and avowal of parties. For a time Federalist leaders retained power by virtue of the momentum of the masterful stroke by which the constitution had been established. It was apparent, however, that the program of quickening industry by "the incitement and patronage of government" as outlined by Alexander Hamilton was premature. More suited to the forces at hand was the combination engineered by Thomas Jefferson and his anti-Federalist associates, which as a party was first called Republican and later Democratic. In bringing about its decisive triumph in 1800 shrewd organizers found an ally for the small farmers and backwoodsmen in a spirit of self-assertion which was at work among humbler people in the large cities. The resulting coalition became a durable feature of the Democratic party. It was strengthened by the equalitarian ferment in the second quarter of the century, when something like a mild social revolution transformed many institutions. In the period of political reorganization

connected with the Civil War moreover the attitude of recent Irish immigrants toward the Negro, partly explicable as fear of a competitor, facilitated cooperation between southern agriculture and such political machines as Tammany Hall in New York City. It was significant that the urban element in the Democratic party continued to come from cities more commercial than industrial, in which vaguely restless masses reacted in politics primarily as consumers. This fact in addition to the sharing of enemies afforded ground for common action with the countryside. But the incongruities were always troublesome and metropolitan growth was destined later to make the party's center of gravity uncertain.

Originally and predominantly, however, land was the factor which gave the Democratic party its character and direction. At the outset, when the advance agents of industrialism talked of tariffs and of stimuli even more direct, it was natural that agricultural spokesmen should stress *laissez faire* and state autonomy. These aspects of policy were in fact superficial and temporary. So far as there has been an underlying harmony in the behavior of the groups composing the Democratic party, it has been the fundamental support of economic deconcentration. Its consistency, like that of other major parties in the United States, has rested not in ideas but in the persistent coherence of interests. The real party division in the United States has been based on the reality of the conflict between wealth in the land and wealth seeking outlets in industry.

The process by which parties gathered around the nuclei of these two forms of property was complicated by sectionalism, a word which is inadequate to describe the peculiar role of spatial considerations in American society. The size and physiographic diversity of the country are likely at all times to accentuate questions of distance and position. In the past the rapid territorial expansion has had as a concomitant a heightening of geographical consciousness. The grievances thus engendered are the sort which may be sharpened rather than lessened by the standardizing of ideals. For in the United States sectionalism has involved more than merely the control of the politics of each region by the strongest economic element in it. The further and distinctive characteristic has been the collaboration of diverse interests related by neighborhood.

In the face of this deep tendency anything like the cohesion of the varied agricultural inter-

ests throughout a continent in course of settlement could not be maintained. The resulting bifurcation of agriculture became the most decisive fact in the making of the historic parties. The sectional division had a commodity basis. Rifts between cotton and grain producers would doubtless have become serious even if the issue of slavery had not existed. The very different relation of the two products to foreign trade (toward which cotton culture was primarily directed and from which it feared no competition) would have been ground enough for lack of unity in agriculture as a whole and for the receptiveness of those engaged in grain growing and mixed farming to an alliance with manufacturers. Slavery deepened the fissure. Having languished elsewhere, it was vitalized in the south when the enlarged markets attendant upon the mechanization of textile manufacture transformed plantation economy into a vigorous and expanding industry. Two forms of agriculture, slave and free, raced westward for possession of the unsettled lands; the future control of the country seemed to be at stake. During the first half of the nineteenth century, while the discordant elements held together, agriculture exercised hegemony through the instrumentality of the Democratic party. Its rule was not essentially interrupted by Whig victories in the presidential elections of 1840 and 1848. Industry meanwhile was restive; the downward course of the tariff after 1833 seemed a symbol of its disadvantage. Nevertheless, it was the small farmer rather than the cautious capitalist who eventually forced a recombination of political elements. The preliminary multiplication of parties which marks the early stages of a passionately felt, fundamental controversy was evidenced in the appearance of the Liberty, or Abolition, party in 1840 and the Free Soil party in 1848. The Republican party, emerging in the congressional elections of 1854, followed the latter in proposing in the spirit of partial compromise that slavery should be confined to the states in which it then existed. The new party quickly replaced the incoherent Whigs, whose respectable ranks (originally gathered under the common name National Republican in opposition to Andrew Jackson) had included some of the wealthiest families of the lower south. The sectional cleavage was completed by the rupture of the Democratic party in 1860, opening the way for the election of a Republican president and leading to the attempted secession of the southern states. Party realignment became fixed in four years of

war and in the decade and a half of coercion that followed the northern victory. The factory on the one side and on the other the husbandry of pasture, cornfield and prairie wheatland joined in an alliance which was the more tenacious because the cold bargains it involved were over-spread with sentiment. The basis was laid for the nearly unbroken control of national affairs by the Republican party for half a century as well as for the restive agrarian insurgency within that party which was to be one of the most influential features of later politics.

In the decades following the Civil War the most insistent cause for the spasmodic rise of minor parties was the attempt of the farmers (especially uneasy during the long price decline which ended in 1897 and again in the drop after 1920) to unite southern and western elements against a triumphant industrialism. Outstanding were the Independent National (Greenback) and People's (Populist) parties, which attained their high points in 1878 and 1894 respectively. The fact that these peaks were reached in congressional rather than in presidential elections illustrates the absorptive tendencies against which so-called third party movements must contend in the United States. Populism was strong enough to exercise a decisive influence upon the Democratic party. Previously, when Republican possession of the presidency was interrupted by the election of Grover Cleveland in 1884 and 1892, the candidate of the Democratic party was an easterner and the program of reform which attracted the gathering discontents of the time was cautious and essentially negative. In 1896, however, the nomination of William Jennings Bryan challenged the east on the outright issue of inflation. The sortie was spectacular but unsuccessful; it may truly be regarded as the last occasion when agriculture was strong enough to stand alone and to take the offensive. One effect was to alienate Democratic support in the seaboard states; years passed before the Democrats could again win electoral college votes in that region. Even in 1912, at the culmination of the muckraking and progressive movements, Woodrow Wilson, with all the advantage of a reassuring orientation, was successful only by reason of the Republican schism. In 1928 the Democrats hoped that the candidacy of Alfred E. Smith of New York would enlist the support of new frontiers embodied in urban life generally. But the nomination was ironically inapposite at a time when deflation and depression, soon to spread, still affected agriculture primarily. In

1932 the universality of discomfort gave the west and south a new kind of support in the east in the person of an eastern candidate, Franklin D. Roosevelt.

The recurrent hope of the promoters of third parties has been to unite farmers and industrial wage earners. It has been assumed that the maturing of industry created a three-cornered alignment of interests—farmers, industrialists, workers—which could soon be turned into a new dual alignment. The hope was symbolized in the name given to the Farmer-Labor party of 1920; this stillborn movement, whose immediate impetus had been the appearance of sporadic labor parties in the two preceding years, is not to be confused with the more durable party of the same name in Minnesota, which after 1922 gained a foothold in Congress. While in general the worker has shown less zest than the farmer for combination, the agrarian attitude itself has presented formidable obstacles. Some of the agrarian movements have been emotional, fortified by evangelical affiliations. A deeper difficulty has been that the defenders of agriculture have disbelieved in industrial evolution. The peculiar tone of national politics in the United States is traceable in large part to the fact that movements of reform have depended for practical support upon a body of criticism of the growth of industrialism. Agricultural opinion, with that of the village folk associated with it, has been stubborn in its preference for business enterprise of moderate scale, locally owned and vigorously competitive. In the Progressive party of 1912, when humanitarian zeal was available as a catalytic agent, an attempt was made to unite the agrarian insurgency of the upper Mississippi valley with a twice born capitalism which, conscious of sin as well as destiny, was willing that the solid advantages of integrated organization should be surrounded by safeguards in the form of governmental control. From the standpoint of agrarian attitude the situation was fundamentally changed in the decade after 1921, when, with a bipartisan farm bloc in Congress as a focus, agriculture was consolidating in favor of a program of regimented stabilization. It was preparing to join business enterprise in exchanging the ideal of unlimited expansion for that of security. This, however, was very different from acceptance of proletarian ideals.

From the side of the industrial worker there has been little disposition to force a political realignment in behalf of a new philosophy. What is loosely called labor was indeed politically in-

fluent in an earlier period, although rather as a consuming than a producing element, in behalf of such causes as the extension of public education. Toward the close of the nineteenth century and during the first three decades of the twentieth, however, the trade unions generally stiffened in their refusal to "accept government as the solution of the problems of life." Their interest in politics therefore has been incidental and defensive; and for such limited purposes the guerrilla tactics of rewarding friends and punishing enemies individually have not been inappropriate. Despite the national avowal of a policy of energetic independence local labor leadership where politically active at all has tended to seek favors by becoming an adjunct of the dominant urban machine. To the extent that the agricultural interests have threatened to impede industrial development, wage earners, animated as producers, have been disposed to make common cause with employers. Political socialism, which entered the presidential campaigns in 1892, has been disturbed from the outset and sometimes divided by the question of its policy toward a labor movement so oriented.

Ethnic differences (with which those of religion have been confused) have continued to crisscross American politics. From the standpoint of immigrants and their children the issue has been primarily their desire for recognition in the face of the contempt which the older stocks have felt toward each fresh wave. The formation of small, separate parties has been the thing least suited to such assimilationist purposes. The major parties have taken advantage of the situation by allocating nominations among racial groups with substantial voting power; the multiplicity of petty elective offices has facilitated this process. A kind of assimilation has resulted, although the main effect has been to trivialize public life by diverting discontent from fundamental objectives. These tactics have been practised by all parties, except in the period before the Civil War, when, on the heels of greatly increased immigration, hostility to aliens was organized as the American (Know Nothing) party with implicit Whig affiliations, which correspondingly quickened the appeal of the Democratic party to new arrivals. In later decades there was enough mutual dislike among the various elements of foreign stock to prevent its wholesale affiliation with a single national party. The general tendency has been for the immigrants to associate with the ruling organization of neighborhood or region. An analogous drift has been observable

among Negroes in northern communities, where the notable cityward migration of the Negro population in the decade and a half before 1930 has rendered their vote significant. In their case race has seemed likely to remain stronger than class, to the disadvantage of such radical parties as seek to appeal to them. On the other hand, as their traditional allegiance to the Republican party has relaxed, the strategy of seeking protection through association with strength has seemed likely to carry voting Negroes beyond the alertly eclectic position urged by many of their leaders.

The loose linking of principalities of political power in country wide parties—a relationship suited to the social materials which have been reviewed—has been helped by the paradoxical nature of party structure in the United States. Formal organization has been relatively elaborate. In areas larger than counties, however, the parts have been slackly joined.

Control of the machinery has pivoted in the nominating process. The emphasis thus given has been distinctive of politics in the United States. During the first few decades under the constitution nominees to high executive office were sometimes selected by the adherents of the respective parties in the legislative body. In the era when polite drawing rooms ceased to be important arenas for the making of party plans and when travel became easier, a notable transformation took place. The choice of candidates for elective office and of interim committees was vested in representative conventions, rising pyramidlike from an original base in neighborhood meetings of party supporters (caucuses) or elections held for the choice of local delegates (primaries). The system was universal from the fourth decade until the close of the nineteenth century. From the outset its operation under party rules was attended by irregularities; corrective state legislation began in 1866. A more inherent characteristic than irregularity was indirection, accompanied by slight participation of the rank and file in the caucuses or primaries. Despite these serious elements of misrepresentation, however, it is doubtful that the convention system would have been supplanted by a system of preliminary elections (direct primaries) for the choice of party nominees if it had not been for the concurrence of several circumstances. The underlying cause was the prevalence in the north as well as in the south of areas in which the strength of the major parties was so disproportionate that nomination was equivalent to

election. The immediately impelling cause was the widespread factional strife which accompanied the "progressive" era, with its characteristics of partial disenchantment, optimism and belief in a "public" which would act if given opportunity. In the space of a dozen years after 1903 laws were passed in all but a handful of states making it obligatory upon political parties (defined for the purpose as groups receiving more than a stated minimum of votes in a preceding election) to nominate candidates directly in primary elections conducted under official auspices at public expense. The new instrument was two-edged: on a larger scale than the so-called non-partisan methods gradually introduced in municipal elections the direct primary facilitated recombinations and released what were virtually disguised parties within the shell of the old; but this very fact dulled the appeal of avowedly separate movements. The flexible use of the new machinery was a distinguishing feature of the resurgence of agrarian discontent in the spring wheat area between 1915 and 1921, organized as the National Non-Partisan League in behalf of a program of state capitalism. A counter attack on the direct primary as a system was in progress by 1920. In states like New York it was said that primary elections were prearranged and perfunctory, with few contests and declining popular participation. The ground of complaint in other sections, however, was not desuetude but excess of vitality. In such places it was possible to see what was likely to be the very real historical significance of the direct primary as an episode in the temporary accommodation of an aging sectionalism to new planes of controversy and cleavage.

The pageantry of the national conventions in which presidential candidates are chosen has survived as a symbol of the conservatism of professional politicians in the United States. The fact that they are quadrennial, that they resolve party problems largely in terms of a personal synthesis and that no formal conclaves take place between times illustrates the caution with which party managers have minimized the discussion of policy. This chariness has been related to a pervasive contradiction. Congress and the state law-making bodies have been organized on a rigorous partisan basis, but the voting on measures has seldom followed strict party lines. The making of opinion has passed from the parties to numerous specialized and continuously active forms of association. Periodically of course there has been a prodigious show of partisan propa-

ganda, since the highly regulated tenure, the overlapping areas of self-government and the election of numerous officers have created the habit of long and expensive campaigns. The commandeering of the gratuitous services of officeholders and public employees has been curtailed by the beginnings of a competitive civil service. The use of money has led in nearly all the states to detailed statutory restriction by corrupt practises acts, but, apart from other reasons for their innocuousness, the multiple candidacies characteristic of elections in the United States have made it difficult to establish responsibility. In the dynamic play of special groups the great parties have sometimes been intermediaries, garnering popular demands in platforms which have been like highest common multiples. On occasion the interests composing them have dictated intervention to censor proposals. Most often the parties have been neutrals. The effect has been to fray the threads of controversy and to dissipate coherence. This result has been offset in increasing measure, however, by a national zest for concerted movement which belies both the individualistic tradition of the United States and also the professed theory of party balance.

ARTHUR W. MACMAHON

GREAT BRITAIN. The modern party system began to take shape as an essential institution of representative government only when the affairs of state ceased to be exclusively the prerogative of the crown and became the province of the king in Parliament. The constitutional and religious struggles of the seventeenth century gave rise to a twofold division of political allegiance which has tended to persist in form, if not in the substance, of policy. Between the Restoration and the Revolution of 1688 the issue of prerogative remained unsettled, and the names Whig and Tory were by 1680 commonly used to designate respectively the opponents and supporters of the Stuart claim that sovereignty resided solely in the crown. In Hobbes the Tories found justification for a doctrine of non-resistance, while the Whigs turned to Locke for support of their theory of limited monarchy.

After the Revolution of 1688 the great Whig landed families, the commercial interests and non-conformists were able to maintain an unshaken supremacy until 1760. Toward the end of this period the efforts of Bolingbroke to give his party a new spirit and a more rational orientation, supplemented by the attacks of a would be patriot king and by a growing disintegration

within the Whig party, resulted in the termination of that ascendancy. The following fifty years of Tory preeminence together with the national emergencies of the wars with France led to a partial eclipse of the party system. The Whigs were weakened as the more conservative members of their party went over to the Tories, largely on the war issue. Not until the Whig party was reduced to a compact and more homogeneous group did it begin to form a new party destined to be the forerunner of the Liberalism of the next century.

The slow rise of the cabinet system as a means of reconciling the claims of crown and Parliament, the growing responsibility of the executive to the legislature and of the legislature to the electorate, led to a degree of party organization in both Parliament and the constituencies. This development did not always, however, pursue an uninterrupted course. The period following the Reform Bill of 1832 saw the weakening of the existing party bonds, the embarrassment of the Whigs by an insistent radical wing and the division of the Tories over the repeal of the corn laws. The majority of the party which Peel carried with him remained for years a separate group. Between 1850 and 1860 this disintegration resulted in a series of coalition ministries, most of which were soon terminated by the divergent attitudes of the constituent sections. This period, which witnessed the gradual substitution of the names Liberal and Conservative for Whig and Tory, came to an end with the adoption of the Peelites, including Gladstone, into the Liberal party. The more stable party relations of the next twenty-five years were the foundation of the classic period of English parliamentary government, the finest harmonies of which were marred only by the rise of the Irish Home Rule party with its manipulation of the devices of concession and compromise.

At the turn of the century the influence of the Labour party began to be felt (*see* LABOR PARTIES, section on GREAT BRITAIN), and by 1906 the new party had taken up a normal position in a system already familiar with the arrangement of compromise. The aftereffects of the World War and the history of the coalition government weakened the position of the other parties, while Labour had outgrown its earlier form of organization. The membership and influence in the party, however, continued to be largely that of the trade unions, a fact which has had its influence upon the party policy.

The party's easy acceptance of a policy of

parliamentary opportunism lies at the root of the difficulties which it has encountered since the economic condition of the post-war world became acute. A gradualist policy of socialism presupposes the continued efficient working of the capitalist system. When the existing economic and social system deemed it imperative to take back the concessions already made, the Labour party was forced to choose between the logical but unsocialistic course of participation in a national coalition, with economy as the watchword, and an appeal to the people on the basis of a policy which on its own declared assumptions was not appropriate for the times. The party's recovery from a small minority to a position from which it can perform the normal functions of an alternative government is dependent on its discovery of a new policy.

Although the Labour party is largely proletarian it shares the working class vote with the Liberals and Conservatives. The party is supported also by many members of the lower grades of the civil service and by members of the upper and middle classes who have no material interest in the party's success but are attracted by its promise of social justice.

The severe decline of the Liberal party has followed its abandonment of the principles upon which its success in the last century was founded. The conditions of the industrial revolution seemed to prescribe the social necessity of freedom from state interference and restriction, but the results of the policy of *laissez faire* forced the party to adopt regulation in order to achieve the aim of individual freedom. This shift of ground initiated the process by which the line between Liberal and Conservative has become blurred. During the nineteenth century differences between the Liberal and Conservative parties were never fundamental because no issues arose which went directly to the roots of the social structure. As soon as socialism with its implications for the fundamentals of society became a question for debate, the attitude of the Liberals proved in the main to be very much like that of the Conservatives.

The Liberal strength has been drawn largely from non-conformity and from those individuals whose interests are adversely affected by Conservative economic policy. The doctrines of free trade and of qualified and moderate state intervention still command the support of those who, although not in sympathy with Tory policy, are yet not prepared to go the whole way with Labour. But there is so little internal cohesion

within the party that it is difficult to regard it as anything more than a traditional allegiance of those political elements which have not yet found a resting place in the other extremes.

Philosophically modern Conservatism derives largely from Burke, on whose conception of a nation state as a historical community marked by a spiritual unity Disraeli in the 1860's rebuilt the weak and disorganized Conservative party. Behind all Conservative policy lies the belief that any radical change in political and economic institutions must harm seriously an organism so delicately contrived and balanced. There follows from this a reverence for the crown as the historic symbol and instrument of authority and of national and imperial unity. The Church of England has also been a Tory institution, ever since the seventeenth century struggles were fought out over the combined questions of prerogative and toleration. But while the church remains predominantly Conservative in social doctrine and in personnel, the party's enthusiasm for it has declined with the recession of the church as an effective social force.

The belief of Conservatives in the necessity for a privileged governing class and the fierceness of their resistance to the Reform Bill of 1832 are explainable in terms of their own realistic analysis, which understands that the possession of power means the acquisition of property and that to widen the franchise is to endanger the existing distribution of property. With the destruction of this principle in 1832 they had no other alternative than to gain electoral approval by the introduction of their own franchise bills. At the root of the Conservative defense of the House of Lords lies the conviction that heredity will perpetuate, if nothing else, at least the ability to govern. Only with the decline in popular belief in heredity is the Conservative forced to defend the upper House on simple grounds of utility.

Since 1832 the party's main strength has been in the counties, except for the Liberal southwest and north. With the issue of free trade settled in the nineteenth century, the upper middle class of manufacturers saw nothing to keep them in the Liberal fold. Nor under the changed conditions of twentieth century international trade does the Conservative policy of protection weaken their allegiance. The emotional appeal of the imperialist idea, resentment at high taxation for social services, and protectionist promises of high wages and employment, all account for a large proportion of the Conservative vote.

Since the World War the Conservatives have been dominant continuously except for two brief periods of minority Labour government (1924 and 1929-31).

Until after 1832 there was little extraparliamentary organization in politics. With the widening of the franchise in 1832 and 1867, local associations began to be formed, and in 1861 the Liberals set up a central body—the Liberal Registration Association. In 1867 the National Union of Conservative and Constitutional Associations was formed, sharing in party work with the whips and the central office. Extraparliamentary organization on the modern scale began virtually with Chamberlain's highly disciplined Liberal Association in the late 1870's. The success of the Birmingham association led to the general adoption of similar measures by both parties; and in 1877 there was formed the National Federation of Liberal Associations, which has since existed concurrently with the Central Liberal Association.

The part played by the central offices has become increasingly more important. They now direct and control in varying degrees almost every party activity, and more and more they are depended upon by the local associations for guidance. They have assumed most of the work of the National Union of Conservative and Constitutional Associations and of the National Liberal Federation in directing party organization and in formulating policy. The central office has a considerable voice in the selection of candidates, particularly as the local associations so often rely upon it for funds and other assistance. Control is exercised also over the policies and programs of candidates, while within Parliament members are expected to support the decisions of the caucus. The party organization of the country as a whole is constantly under the supervision and the direction of the large traveling professional staffs of the central offices and of their subsidiary provincial branches, which provide information, money, speakers and guidance to constituencies and candidates in their districts.

The chief party whip no longer holds his former position of control over the work of the central organization, which is now under the direction of the chairman or, in the case of the Labour party, the secretary of the party organization. This growth in the importance of the central office has been a necessary result of the enormous increase in the size and scope of party activity. The grant of full party membership to women in 1902 and of the vote in 1918

and 1928 and the organization of junior associations upon a large scale have entailed a striking development in party activity. The work of political colleges, summer schools and research and propaganda services is also becoming increasingly important under a system in which the voter and his unspecialized representative are required to legislate for the state in its social service and world economic aspects.

The local association depends largely upon the efforts of the paid agent in its work of electioneering, selection of candidate and organization of the constituency. With the development of party activity, the position of the agent is becoming almost a profession. In 1929 Great Britain spent £1,213,507 on recorded election expenses, exclusive of the amount disbursed by central headquarters. Party funds are obtained locally from members' contributions and from candidates, while the central office depends upon industrial and social organizations and upon private donors. Private contributions play a large part in the finances of the older and wealthier parties, while the Labour party is forced to rely more upon the contributions of the local caucuses and upon affiliated organizations, such as the trade unions and the cooperative societies. The position with regard to the sale of honors in return for party funds remained substantially unchanged after the report of the Royal Commission on Honours of 1922. It is a matter of opinion how far the publication of party accounts, which the Labour party has always demanded, would affect electoral allegiance.

Party discipline within Parliament is enforced, failing the efforts of the whips to maintain obedience to the party leader, by the threat of dissolution, which is usually sufficient since no member relishes the prospect of an election and the possible withdrawal of his party's support. On the opposition side when electoral success is not anticipated the threat or expectation of dissolution may give rise to a less independent attitude. The position of the private member is one of subordination to the cabinet, since the government has complete control of the time of the House of Commons. The local caucuses sometimes retain sufficient independence to be able to provide backing for a member's heterodoxy. But to defy both the constituency and the central office is to invite political extinction. The grounds for resignation are not clearly defined, for although consistent failure to support the party in the House or a crossing of the floor is usually regarded as a reason for resignation,

there have been exceptions, in which members refused to comply with local demands.

The House of Lords is overwhelmingly Conservative. It traditionally rejects non-Conservative measures, and since the Parliament Act it has been able either to hold up legislation or to bargain for concessions with any non-Tory government which prefers the emasculation of a bill to the complete crippling of its program.

The king's role has been historically to represent the nation as a unity as against the factional strife of parties. With the partial decline of prerogative into political influence the crown has insisted on its right to be consulted, to encourage and to warn. It has been recently suggested that the king should exercise his own judgment in the granting of a dissolution. But this right has been in abeyance for more than a century and if exercised it would destroy the crown's present party neutrality. The crown also appoints the prime minister, but unless there are two possible candidates for the post of party leader it exercises no real choice; it is at the party conferences and by the influence of prominent party men that the actual choice is made. Since 1837 the crown has grown in social prestige. It has never repeated the attempt of George III to wreck the party system in order to reverse the slow transition of the crown's position from one of power to one of influence. It has become an accepted formula of the constitution that the monarch will abide by the results of the party struggle, although the accession to power of a determined Labour majority, bent upon the institution of socialism, might conceivably change his position.

W. A. RUDLIN

CANADA. In Canada as in the English speaking countries generally political divisions have taken the two-party form. During the struggle for colonial self-government in the first half of the nineteenth century reformers, or Liberals, fought against Conservatives in all the British North American colonies. The British names for the parties continued after responsible government was established; and the British system of cabinet government tended to give the parties a unity and continuity in leadership and policy which were lacking in the United States. But the influence of North American environment, the amalgamation and expansion of the colonies into a loosely knit continental nation with the inevitable sectionalism which resulted, the concentration of public policy upon the rapid exploita-

tion of natural resources, the steady growth of urban industry within a community composed primarily of pioneer farmers, the increasing stream of foreign immigration—all these forces tended to make the Canadian party system similar to that of the United States in organization, methods and personnel.

Fundamentally the division of interests in Canada has been between agriculture and capitalistic finance industry, but this has never been clearly expressed in party alignments. The Liberal-Conservative party, founded in 1854 under the leadership of John A. Macdonald, was a coalition of three groups in the then province of Canada—the Orange-Loyalist group of Upper Canada, the French Catholic group under clerical control in Lower Canada, and Montreal big business as represented chiefly by the Bank of Montreal and the Grand Trunk Railway. Opposed to this party were the French Rouge group of anticlericals in Lower Canada and the Clear Grits of Upper Canada, who were the political expression of the views of the western pioneer wheat farmers. These two opposition groups gradually formed an alliance which became the Liberal party.

After 1867 these party divisions were extended from the two central provinces to the outlying sections of the dominion. The Conservatives in office applied Hamiltonian ideas to the building up of the new nation as expressed in the "National Policy" of industrial protection and in the construction with government help of the Canadian Pacific Railway. The Liberals, coming into power in 1896 after a generation of opposition, continued the policy of protection and railway building; and under Laurier's leadership the party became generally identified with the encouragement of capitalistic business enterprise. By the first decade of the twentieth century both parties were national in the North American sense; that is, their membership was drawn from all geographic and economic sections of the country, and their policy, because of this composite membership, had become completely opportunistic. Each party, however, depending for campaign contributions upon wealthy business men, was primarily an instrument for carrying out the policies favored by the dominant business interests of Montreal and Toronto. The Liberals remained in power until 1911 and again almost continuously from 1921 to 1930, when the Conservatives came in.

The "reciprocity" election of 1911, like the election of 1896 in the United States, is impor-

tant chiefly as a revolt of the western farming interests against this domination. The revolt was unsuccessful. But it was renewed in 1921 after the World War, when sixty-five Progressive members—more than a quarter of the House of Commons—were elected. These were mostly farmers from the prairie provinces and Ontario, with a few western Labour members. The Progressive movement disintegrated during the next decade. But in 1932 the Co-operative Commonwealth Federation (C. C. F.) was launched in western Canada by the same farmer and labor elements, and it has since extended to Ontario, although it has not as yet made much impression east of the Ottawa River. It has adopted a definitely socialistic program and seems more likely than previous movements of protest to break up the solidarity of the old two-party system.

Cutting across all economic and sectional divisions in Canada has been the cleavage between the English speaking, mostly Protestant, majority and the French speaking Catholic minority. Racial and religious antagonisms, expressed in contests over education and language (also over patronage and pork), have aroused much fiercer passions than merely economic issues and have blurred all party divisions based on economic issues. The French, as a minority community, have been much more cohesive than the English. The great majority of them supported the Conservatives for a generation after 1854 and switched to the Liberals with the rise of Laurier. The conscription issue has kept them in the Liberal fold since 1917.

Party machinery in Canada has not been so elaborate as in Great Britain or the United States. There is little of the constant work of education and propaganda which is carried on by English parties. The domination of a political machine by party bosses has not been so marked as in the United States and there have been no efforts to correct abuses of this kind by such expedients as the direct primary. The parties tend to follow the American practise of holding conventions to choose leaders and to draw up programs. Corruption in many forms is widespread; but Canadian political scandals, like other Canadian phenomena, seldom attain the magnitude of those in the United States.

FRANK H. UNDERHILL

AUSTRALIA. Wool was the first Australian product, and the leaders of the wool industry, the "squatters," were the first class to play an

effective part in political struggles. It was their task to hasten the passage of Australia from military autocracy, through a steadily developing representative system, to full self-government, which they came to demand as a result of their opposition to the land policy of the British government. By self-government, however, they meant government by "the pastoral interest." They were therefore opposed by what their leader Wentworth called "mere numbers," whose triumph was assured by the gold rushes which in ten years (1851-61) raised the population of Australia from 405,000 to 1,145,000. The mass of the newcomers were imbued with the ideas of Chartist democracy and succeeded in realizing them early in the second half of the nineteenth century. Interwoven with their struggle for political democracy was a struggle for economic advantages. They wanted to break the squatters' land monopoly and in Victoria they demanded fiscal protection in order to make industrial employment. Politics thus gained coherence as a struggle between "conservatives," representing the pastoral and importing interests, and "liberals," who represented small farmers, artisans, manufacturers and middle class enthusiasts. The liberals won support from the rapidly developing sentiment of Australian nationalism. This sympathy between radical democracy and nationalism was inherited by the Labour party; it remained unshaken until the World War.

The Labour party was formed after the strike of 1890, and in the New South Wales elections of 1891 won 36 seats. It inherited much of the old liberal mentality and policy. It approved and wished to carry further the liberal policies of immigration restriction, land subdivision and closer settlement, governmental development and industrial enterprise. After some hesitation it adopted, during the first decade of the twentieth century and of the commonwealth, the Victorian liberals' policy of protection. It added two things, however, which transformed Australian politics. The first was a new discipline. The second was a new creed—socialism.

The discipline of the Labour party is founded on the class solidarity of the trade unions. Labour sympathizers who are not unionists may easily join a local branch of the party, but the unions are its core. The state and federal conferences of the party appoint executives to watch over the parliamentary caucus, which in turn controls the individual Labour parliamentarian. As for Labour's socialism, it is a creed which re-

mains vague, despite an attempt at precise formulation in 1921 and despite current doctrinal struggles. It is an emotional ideal, an objective, not a policy. Conflict between the ideal, which repudiates existing society, and the actual policies of Labour politicians, who accommodate themselves to existing society in order to win power and to govern, creates a constant tension within the party. From the 1890's onward this tension has repeatedly led to splits and expulsions. Until the depression of 1931 these expulsions did not break the unity of the Labour machine, although for a time (as after 1916) they lessened its power in the electorate. But in 1931-32 the machine itself was split when J. T. Lang, premier of New South Wales, placed the objective before the necessities of the present situation, allied himself wholeheartedly with the local guardians of party orthodoxy and set the New South Wales party machine into opposition with the federal machine. The result has been a widening confusion of splits, factional fights and expulsions which will make the reconstitution of unity difficult.

Until recent years the potential disruptive force of the tension within the Labour party was not apparent on the surface. Labour's discipline was the determining force in Australian politics. This discipline, directed to the achievement of popular reformist policies and exploiting the nationalistic-democratic sentiment of Australians, had rapidly advanced Labour from its original position as a third party bargaining for concessions. In 1915 the party held office in the commonwealth and in every state save one. Already in 1909 the old liberal and conservative forces, hitherto divided chiefly by the fiscal issue, had closed their ranks to resist Labour. All the non-Labour forces may be called parties of resistance. But in order to resist Labour they had to compromise by competing with Labour policies and accepting expelled Labour leaders. Three anti-Labour prime ministers, Cook, Hughes and Lyons, began as Labour politicians. Just as the actual policies of the Labour party bear little relation to socialistic theory, so the actual policies of Labour's opponents bear little relation to the theory of laissez faire. Both groups need the support of a large unattached floating vote, and both have sought this support by offering government action, for example, the developmental expenditure of loan money, to foster individual and sectional well being. Thus the much talked of class war has seldom been present in Australian party conflicts. It was im-

minent for the first time in 1932, when J. T. Lang was premier of New South Wales.

The lack of theory in the anti-Labour forces is indicated by their search for a convincing label; since the fusion in 1909 they have called themselves in turn Liberals, Nationalists (after 1916) and (since 1931) the United Australia party. Their organization is also loose in comparison with Labour's. They have their branches and committees and conferences but these lack the Labour rigidity and discipline. The individual parliamentarian is therefore freer than the Labour member. This is because the propertied, business and professional classes, which are the most faithful anti-Labour voters, lack the close vocational association of trade unionists. Business interests can usually be depended on to contribute ample political funds, although manufacturers frequently support Labour as the high protection party par excellence.

Since the end of the World War there has existed a Country party, based on the rural interests, which has copied the tight discipline of Labour and has reproduced in part Labour's original role of a third party exacting sectional advantages. Its chief declared policy is tariff reduction. It suffers, however, from the diversity of interests between the various rural elements. In the commonwealth the Country party joined the Nationalists in a composite government (1923-29), and it still supports, sometimes grudgingly, the present anti-Labour government. In some of the states the membership of the Country party or Country party groups is agrarian and not unwilling on occasion to support Labour.

The rise of the Country party and the splits in the Labour party evidence a swing away from the simpler two-party system. At the present time there are Labour governments only in Queensland and Western Australia. The effect of the depression has been to strengthen in the industrial east and particularly in New South Wales the left wing socialistic forces in the Labour party. The electorate, by repulsion, has in the eastern states swung strongly from Labour. Very important for the future will be the issue of the struggle between the socialistic believers and the political tacticians within the Labour party. Whether or not there emerges a reunited party and under what conditions it is achieved, if at all, will determine the future not only of the Labour party but also of its opponents.

W. K. HANCOCK

NEW ZEALAND. Parties divide in New Zealand upon domestic rather than external issues. Loyalty to the crown and support of British foreign policy are traditional, although, especially since the World War, the Labour party has been critical in these and related matters, such as defense expenditure.

The main division of parties from the establishment of self-government in 1853 to 1876 was between Centralists and Provincialists. The latter were strong in the southern provinces, which had led the struggle for self-government. Southern progress, while North Island suffered from the Maori wars (1860-72), strengthened their dominance. Vogel's policy, launched in 1870, of borrowing for public works and land settlement resulted in the death of provincialism. When his plans were mutilated to insure provincial control of lands, Vogel secured a majority in 1875 for the abolition of the provincial councils.

Between 1870 and 1890 party lines were redrawn and party allegiances reshuffled. Except for two interludes (1877-79 and 1884-87) the so-called Continuous Ministry held office, evolving from a Centralist to a purely Conservative party, representing primarily the landowning interest. The first opposition of Provincialists was led by Sir George Grey, who made the Provincialists a party of Gladstonian Liberalism. It gathered together all the opponents of the landed party and its conservative, laissez faire policies. Vogel's accession to the party in 1884 added state socialism and developmental borrowing to its program. Its support of trade unionism and its policy of protection to local industries were strong factors in gaining popular favor as the economic depression deepened in the late 1880's.

The Liberal-Labour party thus created was kept in power from 1891 to 1906 by a combination of town workers and small farmers. This was the period of experimental legislation. Seddon's death in 1906 weakened the combination. The trade unions formed an independent Labour party in that year and the small farmers, who had become more prosperous, began to demand the freehold. Mainly with farming support the Conservatives, reorganized as the Reform party, gained power in 1912.

The Reform party not only reversed the Liberal-Labour land legislation but stiffened the resistance to trade union demands. In the ensuing struggle, which came quickly to a head in the breaking of the 1913 strike by the use of

free labor and special constables, the Liberal party lost ground. A national cabinet was formed in 1915 and party politics were suspended until 1919. The Reform party continued in power until 1928 but began to lose ground in the towns because of its low tariff and retrenchment policy and in the country because of its opposition to demands for rural credit. Labour representation grew steadily but it was the Liberals, who had sunk to the smallest party but had been reorganized first as the National and then as the United party, that gained power in the 1928 election. For some months they relied upon Labour support and passed heavy graduated land taxation and similar measures. In the face of the depression, however, this policy was reversed, and in 1931 the United and Reform parties joined in a coalition government. The strength of the respective parties after the election of 1931 was Reform 30, United 21, Labour 24, Independent 5.

In general, party politics and party organization in New Zealand are very closely modeled upon the English pattern. The parties are organized and financed by voluntary effort and party government proceeds according to English law and precedent. The trade union organization is powerful in the Labour party, which defends working class interests, including the civil service claims, and advocates nationalization policies, including a state bank. The Labour gains have been made in the towns, the farming constituencies remaining Reform or United. The demarcation between the latter is not very clear, as their recent coalition proves. The Reform party's low tariff policy is opposed to the protectionism of the small scale industrialists and in general the Reform party represents the more conservative, big business, export group, both in country and towns, while the United party represents the smaller scale industries of local demand and to some extent the struggling small farmer, especially in times of crisis. Recent history has shown that the Labour and Reform parties, representing mainly urban labor on the one hand and the important farming and business interests on the other, are fairly stable, whereas there is fluctuating support for the United party.

Political developments in Britain exercise a strong influence upon party politics in New Zealand, as, for example, in the formation of a national cabinet during the World War and a coalition cabinet with Labour opposition during the depression of the early 1930's. This influence

is equally apparent in current political debates. The coalition government is carrying through a policy of retrenchment in order to balance the budget. Following the recommendations of royal commissions, drastic economies are being effected in government services and salaries have been lowered. Unemployment relief is provided from the proceeds of special, regressive taxation and administered largely in connection with rural developmental projects. The Labour party criticizes and resists this program in principle and in its specific applications. It also offers consistent opposition to assisted immigration, and it voted against the ratification of the agreements made at the Ottawa Conference in July, 1932.

J. B. CONDLIFFE

UNION OF SOUTH AFRICA. When the Union of South Africa was formed in 1910, there was a similar party alignment in three of the four colonies which merged into the union. In Cape Colony, the Transvaal and Orange River Colony the division was primarily on racial and linguistic lines, with so-called Dutch parties in power opposed by the English speaking element. The division, however, was not entirely on racial lines, especially in the Transvaal, where *Het Volk* (The People), the Afrikaans speaking party led by Botha, had formed a coalition with the predominantly English speaking Nationalist party against the opposition of the English speaking Progressive party. In Cape Colony the ruling South African party—a continuation of the Cape section of the Afrikaner Bond which had been formed in 1879 to promote a strong Dutch nationalism, but which under Hofmeyr's leadership had modified its platform to equality between the two races and a broad South African nationalism—had attracted some of the English speaking element, but the majority were in the opposition Progressive (later Unionist) party. In Orange River Colony the *Orangia Unie* was also overwhelmingly Dutch, the Constitutional party essentially English. In the fourth colony, Natal, with the exception of the Labour party, the party lines of cleavage were of a nebulous and essentially temporary character, as is illustrated by the fact that at the first union elections eleven of the seventeen Natal representatives were elected as an Independent block, organized rather on provincial than on party lines. Labour parties, not very strong outside the Transvaal, existed in all the colonies.

At the first union election the South African

party, *Het Volk*, the Nationalist party and the *Unie*, organized as a single entity, which bore the name of the South African (later Nationalist) party and carried the election, and Botha became first prime minister. The united opposition, led by Jameson, was known as the Progressive (later Unionist) party. In general the former was overwhelmingly rural, Afrikaans speaking and conservative, while the latter, almost entirely English speaking, combined an essentially urban and progressive character with loyalty to the British traditions and to imperialism as interpreted in 1910. Somewhat accidentally it supported the great mining interests of Witwatersrand.

In 1913 the Nationalist party split, principally over the language question and the imperial connection. The seceding minority under General Hertzog kept the former name of Nationalist (or National) party, while the large majority remained faithful to Generals Botha and Smuts and, reenforced by the adhesion of the Natal Independents, took the name of the South African party. This division and nomenclature have dominated union politics ever since.

The Nationalist party was overwhelmingly Afrikaans speaking, enthusiastic for the development of the Afrikaans language and traditions, committed to a policy of "segregation" as regards the large native population and somewhat hostile to the imperial connection as understood at that date. Its relation to republicanism is somewhat difficult to describe. Every republican was a Nationalist, but not every Nationalist was a republican. With certain lapses organized Nationalism has stood rather for independence and equality within the British Commonwealth than for secession. The points of view of moderate Nationalists and of moderate supporters of the South African party have tended to agreement on this point, except at times of excitement.

The outbreak of the World War, accompanied as it was in South Africa by a rebellion supported by the more extreme Nationalists, did much to intensify the bitterness of party feeling. After the war, when in the Parliament of 1920 the four parties—South African, Nationalist, Unionist and Labour—were so nearly equal in number that no one could govern alone, General Smuts held out the olive branch to the Nationalist party; the anticipated combination failed, however, when this party refused to sacrifice its objective of "sovereign independence." General Smuts then turned to the Unionists, who,

spurred on by the growing strength of the Nationalists, made the extraordinary gesture of dissolving as a party and joining the South African party, which thenceforth possessed a much more urban and English speaking character.

General Hertzog countered in 1924 by forming an electoral pact with the Labour party, which had become increasingly hostile to the government party, both because of the latter's absorption of the Unionist party, the representative of the mining interests, and because of the suppression by the government of industrial disturbances in Witwatersrand in 1922. The Nationalist-Labour combination carried the election of 1924 and established a coalition government, the result of which, however, was the disruption of the Labour party into two warring factions. The rapid movement toward republicanism and secession which was expected to follow Hertzog's rise to power did not materialize, partly because of the attitude of his Labour allies, partly because Hertzog himself apparently did not really want secession and partly because of the changed status which the dominions acquired as a result of the imperial conferences of 1926 and 1930.

The official programs of the South African party and the National party reveal few startling differences. Both accept the new conception of imperial relationships enunciated by the conferences of 1926 and 1930. The divergencies are in tendency and tradition more than in program. The support given to the National party comes almost exclusively from Afrikaans speaking sources, although a considerable minority of Afrikaans speaking voters give their support to the South African party. Nationalism is stronger in the rural than in the urban districts. Certain areas, such as Natal, vote solidly for the South African party and others, such as the Orange Free State, as solidly for the National party. The most uncertain and incalculable area is the gold mining center of Witwatersrand. Of recent years, although the parties have been very evenly divided, Nationalism has commanded a small majority.

Early in 1933 a coalition between these two historic parties was formed and a National Government called into existence under General Hertzog as prime minister and General Smuts as deputy prime minister. In the election of May, 1933, the coalition secured 139 of the 150 seats, of which 75 were held by the Nationalists, 62 by the South African party and 2 by a Coalition Labour group. The opposition Labour

party gained only 2 seats. As a nation wide reconciliation after years of very bitter opposition the coalition phenomenon is almost unique. Its effect on the future political development of South Africa is difficult to estimate.

EDGAR H. BROOKES

IRISH FREE STATE. A single deep cleavage, nominally on constitutional issues, has assured the existence of two major parties in the Irish Free State despite proportional representation. The existing parties emerged when the negotiation of the Anglo-Irish Treaty in 1921 destroyed the political unity of the war period. Sinn Fein then split into the pro-treaty party (organized as *Cumann na nGaedhal* in 1923) led by William T. Cosgrave and the anti-treaty, or Republican, party (organized as *Fiaanna Fail* in 1926) led by Eamon De Valera. The Irish Farmers' Union and the Irish Labour party also entered the election of 1922. The rift in Sinn Fein followed a fundamental division in Irish society. The more prosperous farmers, tradesmen and white collar workers had become incorporated to a large extent in the social, economic and cultural system of Britain. On the other hand, the small farmers, especially in the poverty stricken west, remained outside this system and their economic fate prompted rebellion; they were joined by the youth of the nation, since the door of opportunity has been closed to the young men and women of Ireland and they can find few jobs, cannot establish new farms, must marry late and remain under the parental roof abnormally long. Irish politics are therefore divided into conservative and Republican camps, within which there are subdivisions due to historical, social and economic factors.

The conservatives are united in favoring low taxes, the union of all Ireland in a single state, the economic development of the country with special regard for the opportunities in the British market and the maintenance of the imperial connection or its gradual change by negotiation. The ex-Unionists enter elections as independents. The farmers, organized for economic purposes, form the next group to the left. A third group, the remnant of Redmond's Irish Nationalist party, organized as the National League in 1926, urges the formation of a national coalition without Cosgrave or De Valera. In 1932 a Center party was organized with support from the large farmers and Nationalists. *Cumann na nGaedhal* is pledged to foster eco-

nomie development and the Gaelic language and has leaned toward the Republican economic policy. The conservative groups support Cosgrave, but a move to unite all of them in a National party was interrupted by the 1933 election.

The Republicans, led by De Valera, are united in favoring the political and economic independence of the country and the establishment of a common government for the whole island. The principal political aims are the revision of the Anglo-Irish agreements, the abolition of the oath to the king, the decentralization of government and the extension of social services. The economic objective is the maximum development of Ireland's resources and a more equal distribution of wealth. The means to this end include tariff protection, the development of widely dispersed small industries to balance agriculture, the retention of the annuities collected under the Land Purchase Acts and formerly paid over to the British government and, finally, the substitution of tillage for grazing. The Irish Republican Army, which still refuses to recognize the existing constitution, and *Saore Eire*, which advocates a collectivist republic, are led by a small group of intellectuals who regard De Valera as too moderate.

The Irish Labour party, based upon the unions of skilled labor, is really a center party which urges the shelving of constitutional issues until economic problems are settled. It is strongest in a belt of constituencies from Dublin to Limerick.

SEATS WON IN ELECTIONS

Irish party organizations resemble those in Britain. The local clubs are usually moribund between elections. The annual conventions are relatively unimportant and real power lies with the standing committees of the national executives, which control the administrative machinery and may veto nominations made locally. The national executives are composed of men chosen by the convention, by the local organizations, by the parliamentary representatives and

by cooptation. Party funds are raised by affiliation fees and popular subscriptions in Ireland and, especially in the case of *Pianna Fail*, abroad; the funds are spent upon the upkeep of the central offices, the conduct of party newspapers, extensive speaking tours and poster campaigns. Patronage plays a very minor part in Irish party functioning, since the executive has relatively few positions at its disposal. Violence in Irish campaigns has received unwarranted attention, but in 1933 conflicts between the Republican extremists and the pro-treaty Army Comrades' Association threatened to become serious. The Roman Catholic church is officially non-partisan, but the bishops' pastorals and the activity of some of the older clergymen have aided Cosgrave. Party allegiances are stable in Ireland and the Republican success is due more to the winning of new voters than to proselyting among conservatives.

WARNER MOSS

FRANCE. French political parties, in respect of lack of organization, vagueness of programs, willingness to compromise and the indiscipline of those who are elected, differ vastly from political groups elsewhere. They are in some cases generals without troops; in others, masses of men without important leaders. Some of the political groups are of only local importance. They have a high death rate and a high birth rate as well. The so-called political parties are much less important than the groups into which the members of the Chamber of Deputies segment themselves—sometimes because of party policy or program, but not infrequently because of more probable preferment in the selection of the personnel of parliamentary commissions and cabinets and sometimes because of unwillingness to be the known associates of politicians who are in certain groups.

To the foreign observer there are only imperceptible nuances which separate some of these groups, and even to the initiated Frenchman the divergencies are sometimes not translucently clear. The party system, however, has its roots in the great moments of French history. There has been a steady shifting of labels so that the conservative parties now call themselves Republican and the moderate parties have adopted the appellation Socialist. In a considerable measure the framework and programs of modern French parties have been fixed by the controversies which, in modern times, have

caused ancient alignments to reappear. The Dreyfus affair and the great struggle between church and state, which marked the turn of the century, are largely responsible for the lines that are at present drawn between French political parties.

Thus the Republican Democratic Alliance in its present form dates from 1901. It has no definite party organization and no separate group in the Chamber. It permits its members to belong to the left center groups, but it leans strongly toward social conservatism with "neither reaction nor revolution" as its watchword. The Republican Democratic Federation, formed in 1903, is the real conservative party—aggressively nationalistic, opposed to the separation of church and state and particularly to civic discrimination against the clergy. Its adherents in the Chamber, for the most part, join the *Groupe de l'Union républicaine démocratique* and in the Senate the *Gauche républicaine* and the *Groupe de l'Union républicaine*. These are the principal right and center parties.

On the left there are three major electoral associations, the first two of which have organizations in the country and some discipline over their members: the Communists, the Socialists and the Radical Socialists. The Communists, who broke away from the Socialists in 1921, are much the same as Communists elsewhere. The Socialists are a class party aiming at the socialization of the means of production and exchange; that is, the transformation of capitalistic society into collective society by means of the economic and political organization of the proletariat. The parliamentary members form a cohesive group in the Chamber and are not averse to participation in bourgeois governments. Their wishes have been overruled, however, by the national council of the party on the ground that such participation would obscure the party's class basis and would help to maintain the domination of the middle classes. The Radical Socialists consider themselves the heirs of the Jacobins, of the revolutionaries of 1848 and of the founders of the Third Republic. This party, whose present orientation was determined by the Dreyfus affair, aims to be broad bottomed and to select its adherents from all classes. It champions the absolute laicity of the state and gratuitous secular education. Deputies belonging to the party adhere to the Radical Socialist group in the Chamber and those

who are senators ally themselves with the *Groupe de la gauche démocratique radicale et radicale-socialiste*. Of the minor parties which are important enough to justify mention the Popular Democrats, recently formed, have as their motivating force *le christianisme social*; the Republican Socialists eschew revolutionary Marxism and do not differ vastly from the Radical Socialists; and on the right the royalist Action Française, which since 1925 has been inactive electorally, continues to exert some intellectual influence. These are the principal groups that appeal for the suffrages of French electors.

France, it is frequently said, has an extremely multiple party system; but the phrase is somewhat misleading. To a greater extent the multiplicity is one of groups in the Chamber of Deputies. There are, as has been said, a half dozen party labels which are used at elections and a half dozen party organizations which attempt to propagandize throughout the country. After they get into the Chamber, however, the deputies segment themselves into groups which may or may not have any relation to the so-called political parties. Candidates may even run under no party label at all. Thus Tardieu was elected as a *Républicain de gauche*, which is the designation not of a political party but of a group in the Chamber. The members of the different groups moreover may shift during a legislative season. A new group may be organized and draw its members from several sources. Save for the groups of the extreme right and the extreme left, there are no easily discernible differences of doctrine or program. The groups are important in that in proportion to their number they are represented on the grand commissions of the Chamber. A deputy not infrequently chooses his group solely because he will thereby have a better chance of securing a place in an important commission. The members of a group may see eye to eye with the prime minister on foreign policy but oppose him on domestic policy. Save for the groups of the extreme right and the left, cohesiveness can rarely be depended upon in important votes. The rule rather than the exception is for the groups not at the extreme right or the extreme left of the Chamber to divide in three varying proportions: on every vote some members vote yes, some no and some abstain. This is true particularly of the groups of the center, the so-called *charnières*, or "hinges," of the

majority. The situation can clearly be seen, for example, from the vote of confidence in the Steeg ministry in December, 1930, and the accompanying Table I serves to show as well the extreme divisions of the Chamber.

TABLE I

NUM- BER VOT- ING	GROUPS	FOR	AGAINST	AB- STAIN- ING	AB- SENT ON LEAVE
18	Démocrates populaires	—	18	—	—
85	Union républicaine démocratique	—	85	—	—
31	Action démocratique et sociale	—	31	—	—
64	Républicains de gauche	5	53	6	—
17	Gauche sociale et radicale	1	14	2	—
51	Gauche radicale	24	18	8	1
22	Indépendants de gauche	13	6	3	—
15	Républicains socialistes	12	1	2	—
14	Parti socialiste français	14	—	—	—
113	Radicaux et radicaux socialistes	112	—	1	—
107	Socialistes	106	—	1	—
9	Communistes	—	9	—	—
41	Députés indépendants	—	37	3	1
13	Aucun groupe	3	7	3	—
7	"Non inscrits"	1	5	1	—
607		291	284	30	2

The right may be said to consist of the following groups: *Démocrates populaires*; *Union républicaine démocratique*; *Action démocratique et sociale*. There is a group of independent deputies who are mostly of the right, while some deputies are so independent that they either refuse to belong to any group at all or put themselves down as *non inscrits* in any group. The center includes the *Gauche radicale*, the *Républicains de gauche* and the *Gauche sociale et radicale*. The left takes in the Socialists of various shades and the *Indépendants de gauche*.

Despite vagueness of programs and unreality of groupings the fact is that the French elector in being forced to choose between a number of candidates in a single member constituency is not confronted by an unmanageable task. The right and left candidates are clearly marked. The principal difficulty arises in respect of the center candidates, but these express their political opinions with sufficient clearness to indicate to their constituents whether they wish to appeal to the left or to the right. The situation furthermore is clarified on the second ballot when candidacies are withdrawn and the right and left, particularly the latter in its "republican discipline," concentrate

in support of the leading contenders for the Chamber.

French publicists have shown a singular neglect of the phenomena of political parties. Interest has been confined almost exclusively to political anatomy and has not extended to political physiology. With the exception of André Siegfried's studies, there has been scant attempt at an analysis of parties and their workings. Siegfried argues that a more or less regular swing from the right to the left and then from the left to the right is a principal characteristic of French parliamentary politics. If a government is based on the left, its fiscal policy is uncertain and its administrative achievements are limited. Hence the support of certain interests is alienated. On the other hand, if a cabinet of the left in an attempt effectively to govern draws to itself the support of "reactionary" interests, the "pure" elements are made uneasy. If a left cabinet simply carries on current affairs it has no *raison d'être*. If, on the other hand, it attempts to carry out its social program, the danger is that its moderate wing may be alienated. When affairs become critical a coalition of the center and the right forms spontaneously. Thus the *bloc national* came into existence, but the formation of the *cartel des gauches* almost immediately followed and was successful in the elections of 1924. In much the same way the Meline regime prepared the way for the "republican defense" of Waldeck Rousseau and the *bloc de gauche* of Combes. A permanent concentration of the middle groups directed against the extremes has never been able to establish itself in France. The reasons for this are the French passion for logic and the electoral system with the second ballot. "With this system," says Siegfried, "the center of gravity passes successively from the Left to the Right and vice versa but, happily, without being able to get far from the center, where, however, it is never exactly fixed. The center, which reasonable people would wish to be a large plateau with a square base, is unfortunately only a thin ridge with two slopes, or rather—for this again would be too simple—an entanglement of ridges which nevertheless inexorably share the tendencies between the two declivities." Every time this center of gravity changes even slightly there is a French cabinet crisis. In England, on the other hand, the center of gravity can change but the cabinet stays in

power. The swing of this pendulum is illustrated by the period since the World War: the *bloc national* from 1919 to 1924 and then the *cartel des gauches* from 1924 to 1926 and the Poincaré regime, with left representation from 1926 to 1928 and afterwards in a changed form.

Because of the French party set up and the electoral system a small swing of votes in the country has a marked effect on the composition of the Chamber of Deputies. It was estimated in 1924 that a change of 3 percent in the popular vote caused a change of 33 percent of the deputies. In the last election of 1932, the Chamber swung sharply to the left. Its support is shown in the following table.

TABLE II

GROUPS	NUMBER OF VOTES	NUMBER OF SEATS OBTAINED
Conservateur	82,859	5
Union républicaine démocratique	1,233,360	76
Indépendant	499,236	28
Démocrates populaires	309,336	16
Républicains de gauche	1,299,936	72
Radicaux indépendants	955,990	62
Radicaux-socialistes	1,836,991	157
Républicains socialistes	515,176	37
Socialistes	1,964,384	129
Communistes-socialistes	78,472	11
Communistes	796,630	12
Total	9,575,370	605

Lachapelle, the authority on French electoral statistics, estimates that the ministerial majority of 1928, composed of 334 deputies in the first six of these groups, obtained 4,500,000 votes. In 1932 the vote for candidates of these groups was 4,380,000. This small deflection of the popular vote meant a loss of 75 seats in the Chamber. On the other hand, the parties of the left in 1932, polling a popular vote which was only 446,000 in excess of the 1928 total, gained 70 seats in the Chamber. It is in this fashion that the party system, aided by the large number of candidates for the Chamber (in 1932 the number was 3617), the number of independent candidacies, the vagueness of programs and the second ballot, influences French political life.

LINDSAY ROGERS

BELGIUM. The revolution of 1830, which created independent Belgium, was engineered by Liberals and Catholics united in a *Union des oppositions*. The young lawyers and journalists of French education who composed the active liberal elements were descended from the various bourgeois groups which had supported centrali-

zation and secularization since the time of Joseph II of Austria, Napoleon and William I, king of the Netherlands. Dedicated to the principles of 1789, they took as their political ideal English parliamentarism—based on a narrowly restricted electorate. The Catholic party, represented by the clergy, nobility and large landowners and passively favored by the masses, was stanchly traditionalistic and regionalistic. After the termination of the *Union* in 1846 the cleavage between Catholics and Liberals gradually crystallized, becoming accentuated after 1860 by developments within both parties. While the doctrinaire, moderate wing of the Liberal party was losing ground to the progressive left, which was clamoring for democratic reforms and radical anticlericalism, the Catholic party encouraged by the accession of new dynamic supporters, particularly from the nascent Flemish movement and the antimilitarists, followed the general trend of the church toward ultramontanism. The government's Manchesterian economic and social policy during the period of liberal hegemony (1846-70) aroused little concern in the traditionally anti-étatist Catholics and the issue between the two parties was joined on the question of public education, which still remains the crux of the struggle between Belgian clericals and anticlericals.

With the rapid industrialization of Belgium during the 1870's and 1880's and the extreme oppression of the new mining and factory proletariat, this clear cut biparty system was broken by the entry of the Labor party, or *Parti ouvrier belge*, founded in 1885 by César de Paeppe and Édouard Anseele. A policy of practical reformism realistically adapted from the Marxism of the Second International under the talented leadership of Émile Vandervelde has characterized the Belgian Labor party almost from its inception. The party has developed an organization which has been consciously accommodated to the traditional propensity of the Belgians for corporate activity. The party is in fact a complex of political and economic organizations—consumers' and producers' cooperatives, labor unions, mutual aid societies, art and education groups—most of them created through the initiative of the party itself and all coordinated through a closely knit party structure, consisting of district federations, which are in turn affiliated with the General Council. The cooperative has been of especial importance not only as the nucleus of party growth but as the source of its financial support.

The political program of Labor until after the World War revolved about the attainment of equal suffrage. Following the enactment of universal suffrage modified by plural voting in 1893 and the establishment of proportional representation in 1899, the strength of the Labor party in the Chamber remained at about 30, as against an equal number of Liberals and about 80 Catholics. Although unable to break the intermittent hold which the Catholics, supported chiefly by the numerous and prosperous class of small cultivators, maintained over the ministry for thirty years (1884-1914), the Labor party compelled the Catholic party to compete for working class favor and to adopt such social legislation as the Sunday holiday and workmen's compensation. As a reaction against the Labor party, there grew up within the Catholic party a Young Right with socialist leanings, most influential in the strongly clerical Flemish provinces. Also related at least partially to the growth of Labor was the disappearance of the antidemocratic features in the right wing of the Liberal party. After 1900 progressives and doctrinaires effected a working union on the platform of equal suffrage, universal liability to military service without privilege of commutation, and compulsory, non-sectarian education. At various times Labor and Liberals joined forces in a cartel, but in view of the deep seated confidence of the former in the effectiveness of the general strike as an emergency weapon, this alliance was essentially a fair weather arrangement.

The introduction of equal suffrage (1919-21) overthrew the Catholic hegemony, reduced the Liberal party to a subordinate position and re-enforced the Labor party, which in addition to being dominant in many industrial centers, particularly in Wallonia, has maintained about 70 or 80 members in the Chamber of Deputies against about 80 Catholics and 30 Liberals. Without sacrificing its characteristic patriotism, Labor took full advantage of the unsettled conditions following the war and of its crucial position for national reconstruction. In the field of social legislation its successes, which include the eight-hour day, compulsory old age insurance and the abrogation of restrictions upon trade unions, have been so extensive as seriously to threaten the liquidation of its program and to jeopardize its capacity to hold its followers without going over to more radical Marxism. Antimilitaristic propaganda has not infrequently served as a temporary tonic. But at present the party is on the defensive, assailed not only by the current

anti-Marxism but, as indicated by the uprising at Hainaut in 1932, by Communism, which had hitherto failed to make any appreciable progress.

The Liberal party, supported by the professional classes, big business and to a large extent by the well to do and well educated urban elements, is suffering still more acutely from a liquidated program. With its major objectives realized by the pre-war Catholic ministries, its only strong rallying cry, radical anticlericalism, is an added source of weakness, since it divides the progressive left wing from the opportunistic right. Its organization, compared with that of the other parties, is decidedly loose, although it has attempted to coordinate the various Liberal professional, vocational and mutualist associations through a national Council. Nevertheless, a certain survival value inheres not only in its connection with industrial and financial capital but in the fact that it wields the balance of power between socialists and Catholics: since the war the most enduring cabinets have consisted of allied Catholics and liberals.

The Catholic party has since the war definitely abandoned the die hard sectarianism which characterized it during the pre-war period, when it was generally dominated by the *Fédération des Cercles Catholiques*. The first attempt to organize the party along vocational or class lines was made by the Christian socialists of the *Ligue Démocratique Belge* (founded in 1891), which has articulated, in a structure similar to that of the Labor party, the various Catholic labor unions, cooperatives, mutual aid societies and educational leagues. In extension of this principle the whole party was reorganized in 1927 by the creation of the *Union Catholique* (strengthened 1932), into which were incorporated the *Fédération des Cercles*, the *Fédération des Classes Moyennes*, the powerful *Boerenbond*—a Flemish agricultural cooperative league—and the *Ligue des Travailleurs Chrétiens*. A priest is attached to every local guild of the *Boerenbond*, as well as to every Catholic working class organization. Despite this elaborate mechanism for maintaining clerical control the leaders are experiencing considerable difficulty in preserving cohesion in a party of such heterogeneous group interests. In an effort to prevent schism the party has made constant concessions to the Christian socialists—a policy not without peril for its hold over the conservative bourgeoisie. The recent tendency of many young Catholic intellectuals toward Fascism presents new sources of dissension.

With the formation of the *Front partij*, or Flemish Nationalist party, as an aftermath of the war, the smoldering threat of radical sectionalism and race conflict assumed a concrete form, accentuated in 1929 when the party won 11 seats in the Chamber. The legislation of 1932, reforming the linguistic system in use in the administrative, judicial and educational spheres, seems, however, to have averted the danger.

FRANS VAN KALKEN

ITALY. See FASCISM; GOVERNMENT, section on ITALY.

GERMANY. Although it was not until the Revolution of 1848 that the first organized parties emerged in Germany, the cleavage of opinion which they represented had long existed in the realm of thought. The liberals could trace their ancestry to the age of the Enlightenment and could point to Lessing, Kant and Humboldt as their spokesmen, while conservatism, although slightly younger as an intellectual tradition, was rooted still more deeply in the history of Germany. A compound of elements drawn from the legitimistic ideas of the Restoration, Pietism and the historical school, conservative theory owed its formulation to Adam Müller, Karl Ludwig von Haller and Friedrich Julius Stahl. This close relation to ideology has remained characteristic of the German party system throughout its entire development. Likewise typical of this system and equally embedded in its history is the multiplicity of parties. Clearly foreshadowed as early as 1848 by the contest over the mode of unification, the schism of the liberal opposition into moderates and radicals became inevitable after 1866, when Bismarck brought the bitter conflict of king and parliament to a close by recognizing formally the right of parliament to control the budget. By restoring constitutional government Bismarck satisfied the right wing of the opposition and definitely separated it from the unappeased left, which demanded a parliamentary democracy. The latter became organized as the Progressive party (*Fortschrittspartei*), while the Moderates passed over to the National Liberal party, which during the 1870's when it was led by Bennigsen developed into the mainstay of constitutionalism and the most powerful of the parties.

The basic disharmony arising from confessional differences, which have been of crucial importance as a key to German national psychology, was reflected in the foundation of the

Catholic, or Center, party (*see* CATHOLIC PARTIES). The actual organization of the Center party was delayed until the unification of Germany confronted the Catholics with the urgent necessity of championing the rights of the church in Protestant Prussia and throughout the new empire, in which Protestant Prussia enjoyed a position of hegemony. Precisely because it was a minority party and on the defensive, the Center managed to preserve a united and determined front, which often enabled it to outweigh the divided and indifferent majority, as was indicated as early as the *Kulturkampf* (1871-87). Through its successes in the *Kulturkampf* it gained so enormously in strength as to acquire a key position, which was in part conditioned by the fact that, in complete contrast to all other parties, it was heterogeneous both in ideological basis and in the classes and interests which it represented. Under a clever leader like Windthorst it could tilt the scales in either direction.

If the strategic position of the Center and the split of the liberals effectively forestalled a simple alternation between right and left, the situation was rendered even more complicated by the withdrawal of the working classes from the bourgeois left and the formation, during the economic prosperity of the 1860's, of Lassalle's *Allgemeiner Deutscher Arbeiterverein* (1863) and, under the leadership of Liebknecht and Bebel, of the *Sozialdemokratische Arbeiterpartei* (1869), the two organizations which were united at Gotha in 1875 as the Social Democratic party of Germany (*see* SOCIALIST PARTIES). Because of the bitter persecution which it continued to suffer even after the abrogation of the antisocialist laws in force between 1878 and 1890, the relationship of the party to the Bismarckian state was one of persistent hostility.

To the threat held out by the entry of the proletariat into the political arena, the bourgeoisie, already disillusioned by the failure of the Revolution of 1848, responded by a complete abdication of political ascendancy in favor of the traditional ruling classes—the agrarian and feudal elements which dominated the conservative party. In return the latter protected the bourgeoisie in the economic sphere. However, while the economic measures resulting from this arrangement satisfied the national liberal industrialists who, because of their need for protective tariffs, were in accord with the economic as well as the political policy of the agrarian and feudal elements, they fatally antagonized the commercial capitalists whose interests lay in the

export trade and in economic freedom. Representing the extreme left of the middle class parties, the latter tended increasingly to join forces with the Social Democratic party.

Another important change precipitated at least partly by Bismarck's protective tariff legislation of 1879 was the incipient acquisition of control over party activities by external economic associations. This development laid the foundation for the transition, more evident since the World War than before, from the type of party oriented essentially about a particular ideology to that based on solid interest.

The November revolution of 1918, which terminated the second empire and inaugurated the republic, produced virtually no change in the general scheme of party alignments. Almost all new parties soon turned out to be little more than old groups under new names, with the term *Volkspartei* inserted in order to legitimize them under the young republic. The various pre-war conservative factions, including the *Deutschkonservative*, the *Freikonservative*, the *Völkische* and the *Christlichsoziale* parties, became united as the *Deutschnationale Volkspartei*, which gathered up the opponents of the democratic republic. The Center was split in 1920 by the formation of the federalistic *Bayerische Volkspartei* (BVP), which inclined on the whole more to the right; but the two remained in close working cooperation and the schismatic party was moreover confined to Bavaria, where until the upheaval of 1933 it played a dominant part in the state government. The National Liberals and the Progressives, after an initial attempt in 1918 to consolidate as the *Deutsche Demokratische* party, continued in existence with new names, the adherents of the former passing over to the *Deutsche Volkspartei* (DVP) founded under the leadership of Gustav Stresemann, while even before the spectacular decline of the *Deutsche Demokratische* party (*Deutsche Staatspartei* since 1930), its supporters showed an increasing tendency to narrow down to the former members of the Progressive party. In a certain sense even the split of the Marxist front, upon the foundation of the Communist party (*see* COMMUNIST PARTIES) in 1919, represented merely the organized form finally assumed by the conflict which had long existed within pre-war German socialism between a radical and a reformist wing. Theoretically defined in the revisionist controversy and practically reflected in the bitter disputes between party and trade unions, the basic difference of outlook behind this conflict may be

traced through the split of the antimilitarists with Social Democracy in 1916, the foundation of the Independent Social Democratic party the following year, the subsequent disintegration of the latter into irreconcilable right and left and the ultimate, although still imperfect, resolution of the antinomy by the flowing of the revolutionary, pro-Soviet elements into the Communist party and the identification of the Social Democrats with parliamentarism and democracy—a decision which inevitably implied renunciation of the class war and ratification of a policy of non-Marxist reformism.

The principal effect of the November revolution, so far as the party system as a whole was concerned, was to alter its function in the state structure. Whereas the second empire had vouchsafed the parties merely subordinate roles, they became under the republic a decisive factor in the control of public policy. So far as the particular parties were concerned, the revolution resulted in a shift in their relative strength and in their position with regard to the state. Aided by the Center and the Democrats, their allies in the Weimar coalition, which had constructed the Weimar constitution and which was essentially identical with the opposition to the second empire, the Social Democrats shouldered the brunt of the responsibility for the republic. Under Stresemann's leadership the *Volkspartei* also gradually became republican in tinge, while even the conservative *Deutschnationale Volkspartei* became sufficiently reconciled to the constitution to participate in the government when opportunity offered, which occurred on several occasions.

In this alignment of parties and in the Weimar system which it supported the first decisive changes occurred with the great social upheaval for which a large share of the responsibility must be ascribed to the inflation. The economic ruin of the middle class not only favored the growth of a type of party dedicated solely to the representation of special economic interests, such as the *Wirtschaftspartei* (*Reichspartei des deutschen Mittelstandes*, founded in 1920) but also produced in this class a psychological and moral shock, the seriousness of which was only outwardly indicated by the collapse of the liberal parties, once the political representatives of "property and culture."

To a certain extent the great social dislocations and more specifically the accentuation of impoverishment since the withdrawal of foreign credit in 1929 help to explain the growth of

National Socialism (*q.v.*) as represented by the *Nationalsozialistische Deutsche Arbeiterpartei*. But in a much deeper and broader sense that movement represented, prior to its acquisition of power in 1933, a protest against the crisis in its totality, against the entire range of shortcomings and procrastinations which beset the public life of post-war Germany. Setting activity against political theory, discipline against conviction, feeling against reason, blood against mind, it is part of an international reaction against the materialism and rationalism of a positivistic *Weltanschauung*. Economically it is antipathetic not only to the monopolistic stage of capitalism, international finance and large scale industry but also to the proletariat, the alleged enemy of property and tradition; the small independent entrepreneur and tradesman, the modest peasant on his own land, the worker imbued with the psychology of the artisan and the autonomy of a closely knit national organism, constitute elements in the party's economic ideal, the whole of which is colored by a vague nostalgia for a precapitalistic or early capitalistic society. Of particular importance has been its condemnation of the Versailles Treaty, since, as is well known, party alignments in post-war Germany have been determined to no small extent by matters of foreign policy. Thus the great coalition of the pro-republic parties from Social Democracy on the left to the *Volkspartei* on the right was held together chiefly by Stresemann's policy of reconciliation and disintegrated in 1930 with the termination of that policy. It was the storm raised by the Young plan which precipitated the subsequent wave of nationalism. Following the accession of Hugenberg to the chairmanship in 1928, the Nationalist party renounced its former compromise with the Weimar system. Although this change of policy produced a number of schisms, leading to the formation of the *Christlichsozialer Volksdienst*, the *Christlichnationale Bauern- und Landvolk Partei* and the conservative *Deutsche Volkspartei*, which supported Brüning in his vain efforts to reconcile the right to the republic, the new groups were unable to attract an appreciable following, and from 1930 on the overwhelming majority of the German right, with the National Socialists in the van, was agreed on the necessity of a radical transformation of the system—the termination of parliamentarism and the emancipation of the nation from what they decried as the ineptitude of party rule.

In matters of organization, leadership and in-

ternal structure National Socialism gradually became the typical expression of the German party system; yet on the whole it merely accentuated characteristics to be found even before the war in Social Democracy, which, in sharp contrast to the loose organization and passive membership of most western European parties, had developed a widely ramified and tightly integrated party machinery calculated to touch its adherents in every phase of their activity. Until 1933 the party was very closely associated with the largest German trade unions, the Allgemeiner Deutscher Gewerkschaftsbund and the Allgemeiner Freier Angestelltenbund (AFA-Bund), as well as with the working men's sport and gymnastic associations; it had highly active organizations for youth and controlled the entire socialistic press. A similar type of party organization was adopted by the other parties particularly in the period following the war. Although not always so well equipped to control affiliated organizations as the Socialist party, the *Deutsche Volkspartei* became connected with the Reichsverband der Deutschen Industrie, the Democratic party with the influential commercial Hansa-Bund für Gewerbe, Handel und Industrie, the *Deutschnationale Volkspartei* with the agricultural associations and the Center with Christian labor unions as well as with the Catholic church. Unfortunately for the parties these developments were accompanied by a progressive expansion of their bureaucracies, which weighed upon their vitality, the more heavily because with a few notable exceptions, such as Ebert, Otto Braun and Severing in the Social Democratic party and Streschmann and Brüning outside, leaders with genuine initiative and a capacity to stimulate the young and dynamic elements of the nation failed to appear. The sterility of the parties as a soil for leadership and the mechanical autonomy of the bureaucracies were only intensified by the introduction after

the war of proportional representation and the list system.

In National Socialism those features by virtue of which the Social Democratic, the Communist and the Center parties had each tended to become a state within a state appeared in heightened form: the Brown House in Munich became the center of a vast network, the threads of which touch at present 2,000,000 active members—twice as many as the Social Democratic party boasted at its peak—and articulate the activities of youth and cultural societies like the Hitler-Jugend and Kampfbund für Deutsche Kultur, economic and social groups like the Nationalsozialistische Betriebszellen Organisation. What preserved National Socialism from the paralytic malady affecting most other parties was in part the vigor of its superbly managed propagandist methods and journalism but more fundamentally its introduction of two new elements, the military motif, concretely reflected in the "Brown Army," and the apotheosis of the ideal of leadership, which in itself has been to a large extent conditioned by the military inspiration. So pronounced is the exaltation of personal loyalty to the leader above the common interests and aims of the group that National Socialism may be said to bear in many ways less resemblance to the normal party type than to such post-war political leagues as the Stahlhelm, the Jungdeutsche Orden and the Reichsbanner. Herein lies the explanation for the enthusiasm with which it was welcomed by the youth, previously the bitterest enemies of the party system.

Inasmuch as such tendencies precluded the possibility of a coalition between National Socialism and other parties on the basis of a common platform, the parliamentary system in Germany has been fatally crippled since September, 1930. Under the impact of National Socialism the other parties also became more inflexible and intransigent than before and the struggle as-

sumed the quality of a religious war, in which the only possible issue for any contestant was overwhelming victory or ultimate annihilation. It is of course impossible to predict the effect of the victory won by National Socialism, together with the Nationalist party and the Stahlhelm, in the spring of 1933. It seems, however, safe to say that the Communist and Social Democratic parties, both of which have been suppressed, will not be revived in their old forms. With the Center and Nationalist parties also dissolved, Germany seems to be headed in the direction of a one-party system. In such an eventuality the inevitable clashes of political purpose must necessarily be worked out within the framework of the single party.

The relative numerical strength of the major parties in post-war Germany, as represented by the percentage of total votes cast for them in general elections, was as shown in the accompanying table.

SIGMUND NEUMANN

SWITZERLAND. The political parties like the politics of Switzerland were originally and are still primarily cantonal. But as the federal state, founded in 1848, has been progressively extending its domain at the expense of the cantons, each principal local party has increasingly been joining hands with kindred groups in other cantons for concerted action in national affairs.

The continued preponderance of cantonal over federal elements in the political parties rests, aside from its historical origin, on the following four circumstances. In the first place, the cantons are quite heterogeneous in professional and social structure, in language and in religion. Therefore such national political parties as do exist are composed of cantonal contingents whose common regional characteristics are often more striking than their respective party diversities. Secondly, there are no nation wide popular elections. The federal executive, the federal judiciary and, in case of mobilization, the commander in chief of the army are elected by the Federal Assembly. Thirdly, the federal referenda are by no means always—not even as a rule—conducted on party lines. On the rare occasions therefore when the national parties might wage a nation wide popular campaign they are as often as not divided among themselves and allied with other parties or fractions of other parties. Finally, no federal constituency extends beyond the bounds of one canton, and it is very exceptional for a

candidate to the federal legislature to stand in any canton but that of his principal residence. Even the federal elections are therefore primarily cantonal affairs. For these reasons the people are never as conscious of their national party allegiance as is the case in almost any other democracy.

This is, however, far less true of the Socialist party than of the others. This party is of relatively recent origin. Foreign influences have always been potent throughout its evolution. Its members are in the main urban and often freshly naturalized wage earners and as such much less attached to any one canton than their rural neighbors. The rigidity of their Marxist program and of their class discipline prevents them from ever officially taking opposite sides on national issues. They are also less disinclined than other parties to set up candidates in cantonal constituencies other than those of the candidate's residence. Thus paradoxically the political party least national in its general policies is the most national in its organization.

On the federal plane the political parties are not in the first instance electoral organizations. They are formed primarily by and for the members of the Federal Assembly. They exist mainly for the election of the federal government and for the constitution of legislative committees. The accompanying statistics, relating to the representation of the parties in the National Council since the introduction of proportional representation in 1919, must be considered in the light of these peculiarities of Swiss political parties. The figures show that four major political parties together hold more than nine tenths of the seats in the National Council. These parties are, however, of very unequal historical significance.

The Radical Democratic party, from which the Liberal Democrats gradually drew away after 1860 and from which the Farmers and Artisans seceded in 1918, was responsible for the

adoption of the federal constitution in 1848. It has always stood for centralization in national affairs and representative as opposed to direct democracy. In the early days of the constitution of 1848 it was strongly anticlerical and anti-traditional. Since the emergence of socialism it has become less radical, while still favoring state and particularly federal intervention.

The Catholic Conservatives, against whose opposition the constitution of 1848 was adopted, were the sole opponents of the Radical Democrats in the early days of the federal state and constituted the principal parliamentary opposition until this role was taken over by the Socialists. It is a confessional party, representing the interests of the Catholic minority. As such it is the main exponent of what is called federalism in Switzerland; that is, states' rights. In the cantons which are entirely or preponderantly Catholic and in the purely rural districts, which are usually Catholic, it is extremely conservative. Elsewhere, especially in the urban communities, it tends to stress the religious and the social elements in its program.

The Liberal Democratic party is a relic of the past. It is made up of Protestant conservatives who, while loyal to the federal constitution, stress the rights of the cantons and advocate economic liberalism as opposed to state intervention. It survives today only in four cantons; in the others the corresponding elements constitute the right wing of the Radical Democratic party.

The Farmers and Artisans are essentially a recent protectionist party. They demand ever more favors for agriculture, threatened by foreign competition, and for handicraft, threatened by large scale industry.

The Socialists, whose progress in the last half century has corresponded roughly to the industrialization of the country, claim to be the sole representatives of the wage earners. They have completely superseded the former Grutli party, which for several generations represented labor. They have in most cantons been able to prevent the formation of a distinct Communist party; in the largest industrial districts, however, where as a majority they have taken office locally, Communism tends to spread. The strength of the Socialist party lies in the fact that it represents not only the industrial wage earners but, in many parts of the country, the lower federal, cantonal and state officials and other citizens living on fixed salaries.

From 1848 until the World War the Radical

Democrats, long allied with the present Liberal Democrats, enjoyed undisputed preponderance in parliament and were the sole masters of the government. In 1891 they reluctantly admitted one and in 1919 a second Catholic Conservative into the federal executive. In 1929 a representative of the Farmers and Artisans party was elected to succeed a Radical. The Radical Democrats therefore, while still ruling Switzerland, do so only as the head of a coalition government in which three of the seven members belong to other parties.

W. E. RAPPARD

NETHERLANDS. The formation of political parties in the modern sense first took place in the Netherlands in the second half of the nineteenth century. Under William I (1813-40) and William II (1840-49) parties were not yet regarded as a normal instrument of government but rather as "factions" that menaced the royal authority and the free and facile cooperation of king and parliament. Ministerial responsibility, introduced in the 1848 constitutional revision, favored the formation of homogeneous cabinets dependent on a majority in parliament, but even this failed to establish organized parties. The parties were in the main still somewhat fluctuating groups of members of parliament ranged about a leader. The formation of great party organizations proceeding from the people themselves was achieved only slowly, as a consequence of the functioning of the parliamentary system and of the parliamentary struggle over the two questions that so largely dominate Dutch politics—the broadening of the franchise and the subsidizing of private (mainly denominational) education.

In the period between the constitutional revisions of 1848 and 1887 four principal groups can be distinguished: the Liberals, adherents of the principles of 1848; the Conservatives, whose action was determined less by principles than by their antagonism to the Liberals and the Liberal leader Johan R. Thorbecke; the Antirevolutionists, an orthodox Protestant party which owed its growth especially to the controversy over the schools; and the Catholics, who at first sided with the Liberals because the revision of 1848 had benefited them in several respects but who later, on account of the attitude of the papal court toward modernism and on account of their wishes regarding the educational question, sought a rapprochement with the Antirevolutionists. The Conservative party gradually

blended with the Liberals and Antirevolutionists. After 1866 two groups of Liberals—a conservative and a progressive—are distinguishable. The final cleavage was caused by the question of universal suffrage, the advocates of which split off in 1901 as a Liberal Democratic party, into which was admitted the Radical party that had meanwhile been formed. The rest again split in two but in 1921 reunited in the League of Freedom. In 1896 the Antirevolutionists also split into a democratically inclined group (the “small folk”) and one of more conservative-liberal leanings; the latter joined the Christian Historical group in 1909. Meanwhile the Social Democratic party had appeared in 1894.

As a consequence of the educational struggle, the “antithesis” that was said to exist between the Catholics and the two Protestant groups on the one hand and the left parties on the other has often been emphasized, although their differences were settled by the constitutional revision of 1917 and the Education Act of 1920. More recently, however, this opposition between “right” and “left” has lost much of its former significance, especially since the three parties of the right, in spite of their parliamentary majority, are not generally able to cooperate.

Since the adoption of universal suffrage and proportional representation, as a result of the legislation of 1917, the parties of both left and right have broken up to some extent. This “splintering” has been more evident in the electorate than in the legislature, however, because the electoral law provides that parties which do not poll at least 75 percent of the electoral quotient are ignored in the distribution of parliamentary seats. Of the many small parties, which are started by discontented or ambitious persons and often have only a single concrete goal instead of a comprehensive political program, most do not generally succeed in gain-

ing seats in parliament. The accompanying table shows the strength of the different parties in the Second Chamber at four-year intervals since 1917. The system of proportional representation, by making the whole country practically a single electoral district, has contributed to the centralization of party organization and leadership and has made even most of the minor parties national rather than sectional in character.

FREDERICK J. A. HUART

SCANDINAVIAN STATES AND FINLAND. The party systems in the larger Scandinavian states rest on similar social and economic factors. Against a bourgeois majority stands a strong socialist minority. The socialists in Sweden and Denmark as well as in Finland after the civil war have wholly accepted revisionism, while Norwegian socialism has remained more radical. In all these countries communism has had a weak parliamentary representation. Bourgeois left groups have held the balance of power, cooperating with the Right or with the socialists. Party strengths have changed but little since the World War. No single party has been able to muster a majority and minority governments have therefore been more common than in other parliamentary states. The methods and organization of Scandinavian parties reveal few unusual traits. Their activities have not been regulated by legislation. In general freedom of political action is permitted; only in Finland have special measures been applied against the Communist party.

Sweden. In Sweden the first party with a fully formulated program as well as an electoral organization was the Social Democratic party, formed in 1889 but with no representation in the Riksdag until 1896. The restricted suffrage hampered the party. In 1900 the Liberal Alliance was formed with democratization as its chief aim. Subsequently these two parties combined as the Left to work for democratic reform; in 1908 they obtained a majority in the Second Chamber. Their opponents, the conservatives, or the Right, united in 1912 into a party (called the National party in the First Chamber and the Farmer and Burgher party in the Second) which held a majority in the First Chamber until the democratic constitutional changes after the World War.

Partly in connection with and partly as a result of the constitutional modifications of 1918-21 the party system has undergone sig-

* Three seats vacant.

nificant changes: new parties have been formed; the opposition between the right and the left is less marked than formerly; and the governments have represented definitely organized parties.

The Right is nationalist and moderately conservative, favoring strong national defense and protectionist measures and opposing socialization. Its leading circles accept parliamentary democracy. It is supported by a large proportion of the more well to do farmers but especially by the upper classes, the bureaucracy, the business men and in general the wealthy and the well educated.

Close to the Right stands the Agrarian League (*Bondeförbundet*), organized in its present form in 1921. It has worked for increased duties on grain and for other measures regarded as favorable to the farmers. It has often cooperated with the Right but has consistently rejected all proposals for united action in the formation of governments; and on certain recent questions, such as school reform, it has worked with the left. The party's support comes almost exclusively from the farmers.

After the democratic reforms the Liberal movement receded; many of its electors went over to the Right, the Agrarian League or the Social Democrats. In 1923 the party split. The old name was retained by a minority, which has held its adherents only in the larger cities, especially among the intellectuals. It has played an insignificant role in the Riksdag, but its press has exercised considerable influence. The majority formed the Independent People's party (*Frisinnade folkpartiet*), which advocated a nation wide prohibition of alcoholic liquors. Even after this question lost all importance, the two liberal parties remained separate. The strength of the Independent People's party is primarily in the middle classes, the small shopkeepers, minor officials and artisans, but also among groups of Free Church and Prohibitionist farmers. Both the Liberal and the Independent People's party have as a rule opposed the protective tariff proposals of the Right and the Agrarians, but they have also fought socialist tendencies.

The program of the Social Democratic party is Marxist, but its tactics are revisionist. Since the death of Hjalmar Branting in 1925 the internal differences of opinion have been accentuated. Some sections have stressed far reaching demands, such as disarmament and partial socialization. Others are hardly distinguishable from

the bourgeois left. The party represents the greater part of the industrial workers and also many farm hands and poorer farmers. In 1919 a Communist party was formed, affiliated with the Communist International; since then a faction which adheres in principle to the Communist program but which has withdrawn from the Komintern has split off. A National Socialist party appeared in the elections of 1933 but won no seats.

Relative party strength after democratization has been quite stable. The following table shows party strength in the Second Chamber since

Right	65	73	58
Agrarian League	23	27	36
Liberal	4	4	4
Independent People's	29	28	29
Social Democratic	105	90	104
Communist	4	8	8

1925. Relative party strength in the First Chamber has been approximately the same as in the Second, although the position of the bourgeois left is stronger in the former. In recent years nearly all the governments have been formed by a single party.

Norway. As long as Norway was united with Sweden, the party positions were determined by questions connected with the problem of union. The Left worked for independence, while the Right long remained relatively friendly to the union. Later social and economic questions chiefly decided the party divisions. The Right, with which the so-called Independent Left cooperates, has opposed social reforms and has stressed nationalism. An agrarian party, formed in 1921, has sought to represent the special interests of the farmers, regarding the policies of the Right as influenced too much by urban industrial interests. The Left in general corresponds to the Independent People's party in Sweden. The largest socialist party, the Norwegian Labor party, was attached to the Communist International from 1919 to 1923; since its withdrawal it has supported an extremely radical program. The less radical Social Democratic Labor party combined with this party in 1927. Prior to 1927, when prohibition was repealed, the liquor question was for many years a decisive factor in parliamentary politics. In general the radicals and the Social Democrats supported prohibition, while the Right and a portion of the Agrarians demanded its repeal. Since 1924 the various parties have had the following representation in the Storting:

	1924	1927	1930
Right and Independent Left	54	31	44
Agrarian	22	26	25
Left	34	30	33
Social Democratic Labor	8	—	—
Norwegian Labor	24	59	47
Communist	6	3	—
Scattered	2	1	1

	1926	1929	1932
Conservative People's	30	23	27
Left	46	44	38
Radical Left	16	16	14
Social Democratic	53	61	62
Justice League	2	3	4
Communist	—	—	2
Schleswig	1	1	1

Minority governments have been the rule. In general they have been formed by the Right or the Left; in 1928 the Labor party and in 1931 the Agrarians held power. The Labor government stressed its opposition to the bourgeois parties by submitting a very far reaching program, including among other things a demand for disarmament and heavily increased property taxes. Within two weeks it was forced to resign.

Denmark. During the closing years of the nineteenth century, the political battle in Denmark was between the left, which demanded a parliamentary democracy, and the right, which wanted to preserve the king's personal power and the aristocratic privileges. After the constitutional changes in 1915 the constitutional question receded into the background and party incups changed. The Conservative People's party, the right, represents the upper classes and especially the more well to do landowners; it favors protective tariffs and a strong national defense. As a rule it has cooperated with the so-called Left (agrarian, or moderate, Left), which gained the support of the great mass of farmers and after the termination of the constitutional battle developed on the whole a conservative character, although it still favors free trade in principle. The radical movements are represented by the Radical Left, with support from the city liberals and the small tenant farmers, and by the Social Democrats. Two coalitions have thus regularly opposed each other; in one the agrarian Left has taken the lead and in the other the Social Democrats. In the Folketing the two coalitions have for many years held about equal voting strength, while the aristocratic right and the agrarian Left have dominated the Landsting.

There are also a so-called Justice League, primarily single tax, a Communist party, and in Schleswig a German language minority group. The strength of the various parties in the Folketing since 1926 is indicated in the following figures. The mandates from the Faroe Islands are not included.

In recent years the Social Democrats and the Radical Left have cooperated among other things to force through a disarmament proposal;

the question of national defense has received considerable attention in Danish politics.

Finland. In Finland a fairly distinct party system arose in connection with the introduction of universal suffrage for the parliamentary elections in 1907. But so long as the Russian regime lasted, the question of the relations with Russia continued to dominate political life. In connection with the events of 1917-19, the declaration of independence, the Communist revolt of 1918 and the adoption of the new constitution, new party groups were formed, which have in general remained unchanged to the present.

The real party of the right is the National Union, representing the greater part of the Finnish upper class and the wealthy Finnish landowners. Before the present constitution was adopted the party worked for a monarchy and since then has followed a conservative nationalistic policy, supporting the Finnish interests against the Swedish minority. The National Progressive party is liberal, and its chief support is urban. The more radical Agrarian party represents the small landowners and by virtue of its central position has often played a decisive part. Both the National Progressive party and the Agrarians draw their adherents almost exclusively from the Finnish speaking population. The Social Democratic party is distinctly revisionist in policy. The Communists figured in the elections of 1922 as an independent party; in 1923 the party dissolved, but it was reorganized and reappeared at succeeding elections. The Swedish People's party, which represents the Swedish speaking minority (about 10 percent of the population), has above all opposed attempts at Finnification and accordingly has at times cooperated with the Social Democratic party, although in economic and social questions it is relatively conservative. Party strength in parliament is shown by the following table:

National Union	38	28	42	32
Swedish People's	23	23	21	21
National Progressive	17	7	11	11
Agrarian	44	60	59	52
Social Democratic	61	59	66	79
Communist	17	23	—	—
Scattered	—	—	1	5

Most governments have been coalitions which nevertheless have not had a majority in the parliament. The Agrarians have usually formed the nucleus, cooperating with the National Unionists or with the National Progressives. On a few occasions all the bourgeois parties have been represented in the government. In 1926-27 a Social Democratic cabinet which did not have definite support from any other party acquired bourgeois support on a few questions of the day by pursuing a moderate policy.

During 1930 a nationalistic and anti-Communist movement called the Lapua movement (from its headquarters in the parish of Lapua) appeared as a powerful factor in Finnish politics. Its support comes chiefly from the Finnish farming population but also from the army and from certain industrial and business circles. In its literary expression it is akin to Fascism and national socialism in its special criticism of the parliamentary system and in its insistence upon the necessity for a dictatorship independent of parties. In the summer of 1930 its activities, supported by the National Union in particular and by scattered groups within other parties, led to the overthrow of the conservative cabinet and to the enactment of legislation which deprived the Communists of their seats in the parliament. Later a constitutional amendment made ineligible to the parliament all members of organizations striving for violent social change. The Lapua movement has since lost strength.

Iceland. In Iceland the party divisions used to be determined by the question of the relations with Denmark. Since Iceland's independence in 1918, three principal parties have appeared: the Independence, which is conservative; the Progressive, representing the demands of the poorer farmers for reform; and the Socialist, with adherents from the small class of industrial workers. The latter two parties have often cooperated, but not in the formation of governments. In recent years the Independence and Socialist parties have demanded proportional representation, because the present system favors the Progressives. In the 1931 elections the Progressive party received 23 seats in the Althing, the Independence party 15 and the Socialists 4.

HERBERT T'INGSTEN

BALTIC STATES. The development of political parties in Russia was hampered down to the beginning of the twentieth century by the absence of representative institutions. Even before the revolution of 1905, however, organization of the

peasantry in the Baltic region had begun along clearly defined lines of nationality and religion, while radical groups of urban workers learned from compatriots in Germany, western Europe and America the technique of partisan group organization. Differences of language accentuated regional or quasi-separatist movements, while differences in religion split the populace of the Baltic provinces and Congress Poland, whether Protestant, Catholic or Uniat, into sharply defined groups basically irreconcilable with orthodox Russia.

In the decade following 1906 the few representatives of the Estonian, Lettish and Lithuanian people in the dumas tended to submerge their identity in that of the Russian parties politically most akin to them. Only the Poles, primarily through the National Democratic Union, maintained their distinctive party organization. After the March revolution in 1917 political groups intensified their activity with a view to obtaining more adequate representation in the All-Russian Constituent Assembly. When that body met in January, 1918, deputies from the Baltic provinces came no longer as Russians of a particular political creed but as Estonians, Letts or Lithuanians openly demanding independence. With the dispersal of the Assembly their sense of constitutional obligation to Russia was overridden by the superior law of self-determination. Down to the end of the World War, however, open political activity was impossible, because of the iron hand of German military occupation or of Soviet efforts to impose Communist rule on the Baltic areas. Only after the withdrawal of the invader could freely organized political life begin.

With land reform a burning issue, with control of education at stake, with the organization of society on individualistic or collectivistic lines in the balance, lines of cleavage quickly began to appear. When provisional governments summoned constituent assemblies in each country, party groups previously colloid suddenly crystallized. The foci around which parties were formed were basically national, religious and economic; in addition the national minorities organized to preserve their respective cultural rights. In each country therefore parties of militant nationalist patriots, fundamentally conservative, were quick to assert their programs, uniformly anticommunist in character yet conceding the necessity of far reaching land reform as indispensable to the organization of a stable social order. Such were the National Demo-

crats (Populists) in Estonia, the National Union in Latvia, the dominant Nationalist Union in Lithuania and, at least until 1926, the National People's Union in Poland. In each country the nationalists found powerful allies among the religious conservatives—Lutherans in Estonia and Latvia, Catholics in Lithuania and Poland. Thus the Christian Nationalist and Christian Democratic parties, united in support of the existing economic order, are found under virtually the same name in all four countries and have exercised a powerful influence on their constitutional development.

The problem of land distribution, initially a vital measure for social stabilization, called into being powerful agrarian parties (the Agrarian Union in Estonia, the Farmers' Union in Latvia, the Farmers' Union in Lithuania and the Peasant party and its allies in Poland), which bore the brunt of land reform and national financial and economic reconstruction. Their numbers are gradually being reenforced by a rising generation of homesteaders, except in Poland, where the colonics following Pilsudski have entered the government bloc. It is to the liberal-radical bourgeois parties, with their democratic ideology, and to their more radical yet evolutionary socialist allies that the Baltic states primarily owe their post-war constitutions. With a permanent service to perform these parties (Labor and Socialist in Estonia, Democratic and Socialist in Latvia, Populist and Socialist in Lithuania and in Poland) contributed heavily in influence and ideas to the framing of the constitutional and administrative structure of the new states. In no instance did Communist groups—whose allegiance was basically to Russia—exert any appreciable influence.

In the Baltic states today political parties rest juridically upon constitutional recognition of their status and statutory definition of their functions, usually in connection with election laws. This was the logical outcome of the demand for proportional representation voiced by virtually all groups at the moment when independence was proclaimed. Proportional representation having been decreed by provisional regimes for constituent assembly elections, the assemblies thus chosen further anchored the established position of parties in the final constitutions and in the necessary implementing legislation, leaving open, however, the possibility of forming new groups. The principal recessions from this initial position, brought about by the instability of multiple party coalitions, have

taken the form of legislation designed to proscribe communism, primarily in Estonia and Latvia, and to discourage the formation of minute fractional groups. Otherwise, particularly in Lithuania and Poland, repression of certain party activities has been effected chiefly by administrative means—in Poland not infrequently at the expense of the national minorities, Lithuanian, White Russian, Ukrainian and German. Only in Estonia and Latvia have the racial, religious and linguistic minorities, as politically organized, been accorded genuine governmental protection. Originally allowed the widest latitude and liberty in all four states, political parties today operate normally and freely only in Estonia and Latvia, having become somewhat futile in Lithuania since the 1926 coup d'état wiped out representative institutions and severely restricted in Poland by the "preventive" and "pacificatory" measures of the Pilsudski regime.

Throughout the Baltic states political parties today reflect in their composition and programs the evolving structure of new political societies. At the extreme right are found the defenders of an obsolete order of society—surviving large landowners, tenacious of the vestigial privileges of an outworn feudal regime; their principal allies, in press and parliament, are the religious conservatives, whether Greek Orthodox, Protestant or Catholic, who desire to perpetuate authoritarian government on the foundations of authoritarian religion. Their principal political concern is to control the educational system in each country and to make it conform to their inherited conception of the social order. Except in the case of the Ukrainian minority in Poland, where repressed nationality has taken refuge in the Uniat church, religious radicalism is practically unknown. The agrarian parties are today intensely democratic and stand for the interests of free farmers under a system of individual land tenure; with them must be classed the more radical nationalist homesteaders, who are more inclined to welcome governmental interference in the national economy. The bourgeois democratic parties, once leaders in the nationalist movement up to the point of its constitutional realization, are today suffering a steady decline, because of the realization of their original programs, the development of more radical parties and the inadequacy of laissez faire individualism in solving contemporary economic problems. They tend therefore to instability and progressive disintegration. Of the left parties the radical agrarian Populists, particularly of Lithuania and

Poland, have either liquidated their program by the enactment of land reform or else, failing legally to attain their objectives, have degenerated, under the duress of dictatorship, into impotent demagoguery. In this position they have been joined by the Polish and Lithuanian Socialists. In Latvia and Estonia, by contrast, the Social Democratic parties, as residuary legatees of the nationalist revolutionary spirit, have evolved by intermittent participation in the government a constructive constitutional program designed to coordinate the retention of individual political liberty under democratic forms of government with the broad outlines of a planned economy.

MALBONE W. GRAHAM

RUSSIA. *See* COMMUNIST PARTIES; GOVERNMENT, section on RUSSIA.

SUCCESSION STATES. Party division in the old Austro-Hungarian monarchy was based primarily upon national, religious and class differences. These were often interlocked with a struggle for territorial autonomy or even for complete independence. In general this state of things is still characteristic of the succession states, particularly of the new or aggrandized states like Czechoslovakia, Rumania and Jugoslavia. Since 1918 none of these states has produced a truly national party in the classic Anglo-Saxon sense, a party which might embrace more than one race, one religion, one social class or one region. The only exception is the Communist party of Czechoslovakia. No other party can boast, for example, of including in its membership both Germans and Czechs in Czechoslovakia, Rumanians and Hungarians in Rumania or Serbs, Croats and Slovenes in Jugoslavia (except for the sham party in the present sham parliament).

The registration of parties is only a legal formality in all the succession states, except Jugoslavia. The Communist party, however, is legal only in Czechoslovakia, where it ranks among the strongest parties. The organization of the Social Democratic party serves generally as the model for all the other parties. These copy as closely as possible its scheme of a salaried bureaucracy, its educational activities, its membership fees, its close relations with trade unions and cooperative organizations, its juvenile and women's groups and especially its strict party discipline.

The peasants constitute the majority of the

population in all the succession states except Austria, and this fact has an important bearing on the political party structure. There are gradations in education and political experience among the peasantries of the various countries. Thus as regards technical and cultural education the peasants of the old Austrian parts of Czechoslovakia and of Austria proper rank highest; on the other hand, as regards length of experience in political activity the peasantry of the old Serbian kingdom take the lead. The Hungarian peasants are the most backward politically. On the whole, however, and disregarding the relative variations in the different countries, the peasantry is the least organized of all the social classes, and its conquest forms the aim of many of the urban parties as well as of the party of landed aristocracy, which is still a power in Hungary. All the ruling parties in the succession states have a more or less pronounced agrarian character, and all the Catholic parties depend for their strength on their hold on the peasantry. Neither the Greek Orthodox church nor the Protestant churches have their own religious political parties, but there are small and unimportant Jewish parties in some countries (Rumania, Austria, Czechoslovakia); and until the recent ban on all but one party in Jugoslavia, Mohammedan parties existed in that country. Except in Czechoslovakia, where there is still a strong, liberal minded bourgeoisie, liberal middle class parties either have dwindled in importance or else never counted at all.

Although all the succession states started in 1918 with strongly marked democratic institutions based on party government, these institutions proved unable to resist the onslaught of antidemocratic forces. Czechoslovakia comes perhaps nearest to being governed by democratic party rule in the accepted Anglo-Saxon sense. It is the only one of the three new countries in which a national minority party is represented in the government. In Austria normal government is greatly handicapped by party differences, with both great parties ready to resort to open violence. In Hungary the ruling party has never allowed other parties to compete on an equal footing at elections, although this right has been granted at least occasionally and to a certain degree in Rumania and in Jugoslavia and has been the rule in Austria and Czechoslovakia. In both Rumania and Jugoslavia the royal power can and often does thwart the power of any party.

Austria. The two great parties, the Christian

Socialistic and the Social Democratic, reflect on the whole the fundamental cleavage between the rural mentality and the urban. Although the Christian Socialists dominate in the rural sections, that part of the rural class which is permeated more with nationalist than with religious sentiment early went over to the program of the German National Socialists. With the victory of the Nazis in Germany, the movement spread rapidly in Austria; despite the repressive measures of the Dollfuss Christian Socialist government, it has absorbed almost wholly the pan-Germanists and the urban Christian Socialists. In the country, however, the Christian Socialists are holding out against the Nazis through the influence of the priesthood among the peasantry.

Party life and political interest are quite vigorous in Austria. The parties are well organized and conduct active propaganda, particularly the Social Democrats and the Nazis. All the parties have funds, collect membership fees and publish daily newspapers as party organs. The almost total disappearance of liberal bourgeois parties, the growth of Fascist doctrines and the rise of semimilitary organizations are noteworthy as indicating the great decline of democratic parliamentarism in Austria since the World War.

Czechoslovakia. In Czechoslovakia race constitutes the dividing line in party set ups. Within the race party division follows either the line of classes (e.g. the agrarian, socialist and trade union parties) or that of religion (the Catholic parties). Generally speaking, the parties are well organized, they often have considerable funds, own their party press (daily papers and reviews) and printing plant and collect membership fees. Since freedom of press and of assembly are more widespread in Czechoslovakia than in any other succession state and there is a lively interest in politics, the party activities are steady and vigorous. Discipline is very strict and is supervised by the secretaries of the parties, who watch carefully the attendance and the vote of the party members in the legislature. Legislative members and all paid party functionaries must contribute usually about 20 percent of their salary to the party funds. Members of the legislature and of the executive are controlled wholly by their parties, and when in power they are much more anxious to please their parties than the government or the prime minister. Opinion within the party is formed by the interaction of the local organizations and the national secretariat. Legal devices permit the party to deprive a recalcitrant member of the legislature of his

seat should he incur its displeasure. Personality counts for little since voting is by lists and nothing can curb the domination of the parties save their great number. Of 300 members of the lower chamber the most numerous party counts but 46. Coalition ministries are thus inevitable. National minorities may justly complain of unequal treatment in several fields of public life, but their representation in the legislature is more in keeping with their numerical strength than is the case in any other succession state. The rule of democratic parliamentarism is more firmly established in Czechoslovakia than in any other country east of Switzerland.

Hungary. Political party life in Hungary is held in close check by the prevalence of the open ballot and by the interference of the administration with the organization of opposition parties, especially in the rural sections. The Party of National Unity, representing the landowners, the manufacturers and the bureaucracy, has been in power almost continuously since the overthrow of communism in 1919. The remaining parties are weak and inefficient, and their sphere of activity is very limited. Except for the otherwise rather weak Social Democratic party, all parties have very loose organizations, which function only at elections and collect no membership fees.

Yugoslavia. Although there is only one legally recognized party, the *Jugoslovenska radikalna seljacka demokracija* (Yugoslav radical peasant democracy), a party for dictatorial and Serbian nationalistic centralization but not opposed to social legislation, the old parties still survive, partly as unorganized cliques within the legal party, partly as illegal formations. Thus far the government has not confiscated (except in the case of the Communist party) the rather considerable property of the old parties, which indicates that the dictatorial government lacks either self-confidence or rigorous aims. The new constitution empowers the leader of the electoral list (i.e. the prime minister) to exclude from the parliamentary party any member who violates party loyalty, thus automatically depriving a member of his seat in parliament. The constitution did not, however, provide for the eventuality of the resignation of the leader of the list, and when Prime Minister Živković resigned, members of the national party found it possible to desert the party and form new parties without losing their legislative seats. There are at present three such new parties, represented by a total of 20 members in parliament. It is believed that

the king looks with favor on the new situation, preferring party anarchy to party dictatorship. The old outlawed parties maintain their existence as regional groups but cannot participate in the national elections.

Rumania. There are two great parties in Rumania: the Liberal party, which is backed by the big banks and represents the political traditions of pre-war Rumania, and the National Peasant party, which includes the radical elements of the old kingdom as well as the majority of the Transylvanian Rumanians. The Liberal party favors strong centralization, which the Peasant party opposes. With the introduction of the new Fascist electoral system, the principle of proportional representation has been sacrificed to obtain a workable majority. The government exerts a decisive influence in the elections but is itself subject to control by the king. Since the World War no government has failed to obtain a majority at the elections which it called. Thus party changes occur only when the king summons a new government and allows it to control the subsequent elections. This arrangement accounts for the great fluctuations in the representation of the Liberal party, the best organized party, in the lower chamber. In 1922 the representation was 250; in 1926, 15; in 1927, 298; and in 1928, 13. The Liberal party has considerable funds at its disposal, while the other parties call upon their wealthy members for support at election time as well as for subsidies for the party press. National minorities are weaker in Rumania than in Czechoslovakia, and there are no movements for territorial autonomy like that of the Slovaks in Czechoslovakia or the Croats and Slovenes in Yugoslavia.

ROBERT BRAUN

BALKAN STATES. Before the World War the struggle of the various great powers for control of the Balkans largely dominated internal Balkan politics, the parties being generally friendly to a particular power or group of powers. Since the war the Balkan states have been divided into Greece, which is satisfied with the existing status, and Bulgaria and Albania, which desire revision (for Rumania and Yugoslavia, see section on SUCCESSION STATES). Foreign influences, however, are much less important than before the war. Party alignment now follows to some extent economic and social lines. Thus there are agrarian, landowners', bourgeois, bureaucratic and workers' parties. Communism is strong in Bulgaria and in Greece. The weak

Socialist party in Bulgaria serves in a measure as a check on corruption.

Individual ambition and governmental coercion, however, play the main role in politics. When a politician is empowered to conduct an election, he uses whatever methods are necessary to secure a majority. A government never loses an election in Albania and only rarely in Bulgaria. In Greece parties are more frequently voted out.

Both the People's, or National, party of Bulgaria and the Liberal party of Greece have a rich tradition and considerable stability. Formed by semirevolutionary leaders with radical programs, these parties later developed into bulwarks of conservatism and dispensers of privilege and wealth. Theoretically Balkan parties are directed by the members through a congress, which usually meets annually and is composed of delegates of the local organization. The congress elects a governing council of 40 or 50 members; this in turn chooses an executive committee of 7 or more, which manages party affairs. The parliamentary group also exercises considerable influence. But the whole apparatus is in the hands of the boss, who is an absolute master. The congresses are hand picked, made up of his delegates. No deputy or even a village mayor can be elected without the consent of the boss, who controls all the patronage. Stambulisky in Bulgaria and Venizelos in Greece have exercised such unrestrained control over powerful party machines.

In most countries the civil service is theoretically stable but actually on a spoils basis. New ministers effect an upheaval of personnel sometimes including even the humblest railroad workers and doorkeepers in state institutions. Only partisans get jobs. Aspirants therefore pass from party to party, seeking favor and position or merely a livelihood. For the sake of security some civil servants possess membership cards in two or three parties. Political struggles thus have an important economic significance for many individuals and are therefore marked by extremes of bitterness and corruption.

Most parties are financed largely by money obtained ultimately from the state. A long period in opposition is therefore a great handicap. Since there are many parties in Bulgaria and Greece, all governments are necessarily coalitions. In Bulgaria, where each party must have a color, there are none left for new groups.

Greece. In the early period of independence, parties attached themselves to the three pre-

tecting powers, Great Britain, France and Russia. Little scope was afforded them, however, until the revolution of 1843 forced King Otto to abandon absolutism for parliamentary democracy. In the ensuing party struggles a coalition of French and Russian parties, which advocated nationalism and immediate expansion, usually triumphed over the English party, which urged internal stability as a prerequisite to expansion. The rise to power of Trikoupis in 1875 marked the triumph of the latter policy over the policy of expansion, which continued to be advocated by his powerful opponent Deligiannis. These two personalities succeeded in a measure in crystallizing the various personal factions into parties subject to their leadership and achieved a degree of party discipline and stability previously unknown. Under their successors in the early twentieth century parties again tended to become personal factions, and party instability and ineptitude finally resulted in the successful intrusion of the Military League in 1909.

Eleutherios Venizelos, a Cretan called into Greek politics in 1910 by the Military League, has been the dominating figure since that time. At least in the first years, and again from 1928 to 1933, he succeeded in placing Greek politics upon a firmer basis. His pro-ally policy led to a bitter struggle between Venizelos and the pro-German king, Constantine. Later, when the republican movement, which culminated in the establishment of the republic in 1924, was gaining ground rapidly, he expanded his Liberal program to embrace it. He now heads the Republican Liberals, the chief party in a Liberal coalition containing several wings or factions and a small agrarian group, which sometimes works independently of Venizelos but almost never against him.

The chief opposition group is the advanced Monarchist, or Royalist (Popular), party, which is perhaps not so much in favor of restoration as against Venizelos. In the elections of March, 1933, the Monarchists defeated the Liberal coalition and Panayote Tsaldaris, leader of the Popular party, displaced Venizelos as premier. The third important party group is the Communist, which is under strict control of the government and which finds its chief support among the workers of Athens, Piraeus, Salonika and other industrial and tobacco producing centers. Military factions, quickly formed, altered and dissolved, play a very important role in Greek politics.

Bulgaria: After Bulgaria became a constitu-

tional monarchy in 1879 two groups developed: a Conservative, favoring Russia and a limitation on democracy, and a Radical, or Liberal, one, opposing Russian domination and reaction and demanding complete popular sovereignty. The Liberals, the stronger of the two in the earlier years, split successively into many groups, including four kinds of Liberals, the Democrats and the Radical Democrats. The People's, or National, party, which constituted the backbone of the Conservatives, is still the best conducted political organization, with a loyal membership of bankers, the wealthier merchants, village saloon keepers, priests and in general the more prosperous section of the population. A Social Democratic party organized in 1894 split in 1903 into Revisionists, who favored cooperating with the bourgeoisie, and orthodox, or Narrow, Socialists, who opposed it. In 1899 a group of village school teachers organized the Agrarian League on the basis of a loose pre-existing organization. Its original activity was non-political; it sought to raise the standards of the peasants through education and cooperative organizations, but a radical wing led by Stambulisky succeeded in converting it into a political party with a fairly radical program.

The elections of 1919 resulted in an overwhelming victory for the left forces, especially for the Agrarian League. With Stambulisky as prime minister the party followed a radical program, in close alliance with the Narrow Socialists, who in 1919 had become affiliated with the Communist International. A coup d'état by the Conservatives unseated the Agrarians in 1923, whereupon the former organized the Democratic Entente, a coalition of Democratic, Radical, Progressive, National and Unionist parties, to support the new conservative government. Although the Democratic and Radical parties soon broke away, the Entente remains the largest bourgeois party. It was defeated in 1931 by a liberal-agrarian coalition composed of Democrats, Agrarians, Radicals and one wing of the National Liberals. Despite repressive measures the Agrarian League constitutes the largest political organization in the land; it is, however, poorly organized and led, and its chiefs, who show little devotion to the village masses, are intent principally on getting into office.

The Communists are an aggressive, exceedingly well organized group, ready to make remarkable sacrifices. In general the party is supported by the youth, intellectuals, ambitious lawyers, provincial civil servants and the urban

poor. Outlawed in 1925, it reappeared as the Labor party and subsequently as the Independent Labor party. In 1931 under the latter name it captured 31 seats, all of which, however, were declared vacant by parliament in April, 1933. Its victory in the Sofia municipal elections in 1932 was also nullified by the authorities.

Because of the formidable revolutionary organization behind it (*see* COMITADJI) the small Macedonian party exercises enormous influence and is largely responsible for the fact that there is more political violence in Bulgaria than in any other European country.

Albania, which became an independent principality in 1912, has had practically no experience with party government. From 1921 until the revolution of 1924 some semblance of party government existed; the Conservative party, led by Ahmed Zogu and representing the large land-owning beys and the bureaucrats, ruled the country, while the Liberal Democrats, led by Fan Noli and seeking political and agrarian reform, were in the opposition. No political parties now exist in Albania; political life is under the complete control of King Zog. There are elections, but all the candidates are the king's men.

R. H. MARKHAM

TURKEY. *See* GOVERNMENT, section on TURKEY.

SPAIN AND PORTUGAL. *Spain.* Political parties arose after the introduction of the constitutional regime in 1812. The issues of absolutism, popular sovereignty, democracy and the position of the church brought about constant changes in party names, membership and alignments. In opposition to the liberal and conservative royalists, the adherents of the Carlist pretender represented the absolutism of the old regime. The primary force determining the rise and fall of parties was the military, brought into the political field by the liberals in their struggle with Ferdinand VII and continuing to dominate it until the restoration of 1874. Republicanism incorporating federalist and social reform doctrines gained ground after 1848 and a coalition of dissatisfied army officers, liberals and republicans brought about the Revolution of 1868, which culminated in the short lived republic of 1873-74.

The restoration resulted in a cessation of party strife, at the expense, however, of the political education of the people. The Conservative and Liberal parties, both accepting the

monarchy, agreed to a system of alternation in office which was carried out through elections manipulated by the corrupt caciques and professional politicians. The Carlists, supported by the Catholic peasantry of the Basque provinces, Navarre and Catalonia, and the republicans, divided as to both objective and tactics, at first constituted the antidynastic opposition. The system of rotation was continued until the World War, although with increasing difficulty because of the disintegration of all the old parties as a result of the death of the leaders and dissension as to their successors, the frequent ministerial changes by the king, the increasing urgency of social questions and the rise of new parties.

Of the new parties the most significant was the *Partido democrático socialista obrero*, organized in 1879 by workers led by the Marxian Iglesias (*q.v.*). Nominally indifferent to the form of government and comparatively moderate in program, its strength lay in its control of the trade union organization—the Union General de Trabajadores—established in 1888, which represented the urban workers of northern and central Spain. The party was slow, however, to achieve political successes. Meanwhile anarchism was spreading in the agrarian south and in highly industrialized but individualistic Catalonia. Although at times the anarchists were numerically stronger than the socialists, they had no effective organization until 1910, when anarcho-syndicalist influences established the Confederación General de Trabajo. Catalan regionalism gave rise to a number of diverse groups, particularly a traditionalist and a rationalist group. Most of the Catalan groups combined for political action in 1892, but a consistent united front proved impossible. The *Lliga regionalista*, founded in 1901, was long the strongest Catalan party; headed by Francisco Cambó, it evolved a conciliatory policy demanding only autonomy. Opposed to it was the Radical Republican party, organized by Alejandro Lerroux in 1903 on a unitary radical republican platform. The Basque regionalist movement acquired homogeneity through its strong Catholic tendency, but its political influence was slight.

Because of the individualism and localism of the Spanish people, the patriarchal character of society, the ignorance of the masses, the sham elections and the backwardness of communications party organization was not highly developed. In general, party organization consisted

of local clubs and committees, provincial juntas and central directorates in Madrid. The major parties were controlled by the parliamentary clique and especially by the party chief, but all parties revolved more or less about personalities. The Socialist party was distinguished by relatively democratic organization, discipline, interest in education of the electorate and attention to questions of immediate practical concern.

During the World War the ineffectiveness of the parties increased as the king turned toward coalition governments and assumed an increasingly important role in politics, while army juntas reestablished the practise of military interference in civil affairs. Economic radicalism of a revolutionary communist or non-political anarcho-syndicalist nature increased tremendously. The perennially troublesome Morocco question finally precipitated a political crisis, from which the dictatorship emerged in 1923 as an attempt to maintain the monarchy and conservative clerical domination. The *Unión Patriótica*, organized by Primo de Rivera to support his regime, was the only party permitted to function freely during this period, although the Socialist party was given certain consideration in order to forestall the rise of labor extremists.

In 1930 the antimonarchical forces effected a coalition including conservatives like Alcalá Zamora, the various Republican parties, Catalan and other regionalists, syndicalists and later the socialists. The coalition sought the overthrow of the monarchy and the establishment of a Cortes Constituyentes which, once the republic was proclaimed, would consider self-government statutes prepared by Catalonia and other regions.

Since the establishment of the republic in 1931, the monarchists have endeavored to consolidate their forces but they have been hampered by the repressive measures of the authorities. The republican parties, however, have achieved a signal expansion. Their tactical unity has been in part abandoned because of the movement of the government to the left and its religious and autonomist policies; new parties are emerging, although they have not yet altogether crystallized.

Of the government parties the largest is the Socialist, with 114 deputies. The *Acción republicana*, represented by 30 deputies, was founded in 1925 by Manuel Azaña, present prime minister, and was the nucleus of the revolutionary coalition; it is composed of able

men, conservatively trained but with radical tendencies, as exemplified by their sponsorship of the agrarian reform and divorce laws. The Radical Socialist party, with 55 deputies, an offshoot of the Radical Republicans, is modeled after its French namesake and shows no particular originality other than defiance of tradition. The Catalan left, or *Esquerra*, with 42 deputies in the Cortes, controls 68 seats in the autonomous Catalan *Generalidad*. Its only rival in the *Generalidad*, the older *Lliga*, controls 19 seats. The *Esquerra* seems to stand for increased autonomy and, in Catalan affairs, for a radical left orientation, which has gained the support of both syndicalists and communists. The Galician Federation, with 17 deputies, seeks a measure of regional autonomy. The slight ministerial shuffle which followed conservative and monarchist gains in the municipal elections of April, 1933, left Azaña prime minister with the additional support of a Federalist group of 15 members.

The chief opposition group is the Radical Republican party, with 90 deputies. Based on the classic principles of French liberalism, it apparently suffers from the lack of a proper social or interventionist program. The Progressive Republican party, a conservative group led by Miguel Maura and President Alcalá Zamora, has 17 deputies. The *Acción nacional*, whose watchword is "Religion, fatherland, family and property," attempts to act as a curb on the revolution, although it seems disposed to work with the republic. It possesses a modern organization and carries on an effective propaganda. A traditionalist party aiming at the restoration of the monarchy is now being formed. Among other minor parties are a Fascist group and the Communist party, which faces a serious problem of survival in traditionally anarchistic soil.

Portugal. The development of political parties largely followed that of Spain. A *modus vivendi* between the conservatives, or *Regeneradores*, and the liberals, or *Progressistas*, was reached even earlier than in Spain, the two parties rotating in office with the assistance of the caciques. From about 1890 difficulties of an international and financial character together with the trend of the crown toward dictatorship caused the parties to degenerate into personal factions unable to form a stable government or to effect reforms. Republicanism gathered strength with the downfall of the monarchy in Brazil, the mounting discredit of the regime in Portugal and the increasing radicalism of the urban masses. The

republic, established in 1910, was unable to solve the economic and political problems, however, or to improve the quality of party politics. The Republican forces disintegrated into factions of which the Democratic party alone could be termed a party. Liberal in character and representing the middle and lower classes, it inherited the secret Carbonari organization, which, frequently guilty of excesses, was used with effect against royalist and radical extremists. The Republican period was marked by intrigues and armed uprisings, culminating in the establishment of the dictatorship in 1926. In 1930 the National Union party was organized to support the dictatorship which on March 19, 1933, won approval, by a plebiscite, of a new constitution establishing a semidictatorial presidential type of government. Likewise in 1930 the Democrats, Socialists, Nationalists and other republican parties, many of whose leaders were exiled, united against the dictatorship. The monarchists maintain their cohesion.

The situation and characteristics of political parties in the Iberian Peninsula are still very uncertain, especially in Portugal. Even in Spain they are not likely to work out their essential programs and positions in the near future.

RECAREDO F. DE VELASCO

LATIN AMERICA. Political parties in Latin American countries originated during the struggles for independence, which lasted from 1810 to 1824. During the early stages of the struggle a large party, comprised in the main of priests, merchants and officeholders, favored the motherland; the Tories of the Indies followed Spain's banner on many widely separated battlefields. The Patriots, consisting chiefly of creoles who were dissatisfied with Spanish rule because of their heavy economic burdens and their exclusion from public office, were at times little more than a determined and vigorous minority which took advantage of political fluctuations in Spain. But with the gradual spread of the revolutionary movement among the uneducated native masses the Spanish troops suffered a succession of defeats, which steadily diminished the prestige of the royalist party. Peru was the last bulwark of the royalists in continental America.

As the revolution progressed, various factions appeared—notably in La Plata in 1819 and in Mexico in 1821—which favored the establishment of monarchical governments. The distinguished patriot commander General José de

San Martín did not believe that the South Americans were ready for democratic government; neither did the Mexican liberator, Agustín de Iturbide, who was crowned emperor in 1822. In his later years Simón Bolívar dreamed of founding a monarchical regime in northern South America. Eventually, however, the republicans triumphed in their desire to create governments patterned after that of the United States, and there emerged in certain sections republican factions called Federalists to distinguish them from the opposing Centralists.

In Portuguese America political parties ran a somewhat different course, since Brazil inherited a monarchical form of government. Although a small republican faction had made its appearance as early as 1817, monarchical traditions and institutions persisted for more than seventy years. In 1889, after a protracted campaign of propaganda in favor of a democratic regime, the Republican party triumphed by means of a revolution which was precipitated by the abolition of slavery. Soon after the exposure of an alleged monarchical conspiracy in 1900 led by remnants of the Monarchist party, the Republican party divided into two wings, the Conservative Republicans, or federalists, and the Liberal Republicans.

During the nineteenth century political parties in Latin America were affected profoundly by the conditions which prevailed in the different regions. In general in both Spanish and Portuguese America only the educated class was much interested in political affairs. The lower strata of society were composed in varying degrees of Indians, Negroes and mixed classes. Large sections of Brazil and Spanish America were sparsely populated by Indians, who were in a barbarous condition. In settled regions where civilization was backward political cliques did not always unite even to nominate their respective presidential candidates. On the other hand, the upper classes in Latin America were composed mainly of aspiring creole leaders who had participated in the revolutionary struggles but had had little experience in the art of government. Under such conditions it was natural that membership in political parties should often become restricted to the aristocratic class and that vested interests should exercise a powerful influence upon party action. Where distinct political parties actually existed, this century was preeminently an era of personal politics—an era which has not

yet passed away in some portions of Spanish America.

During the protracted wars for independence there developed a strong tendency for political parties to group themselves around leading personalities. In Chile the adherents of the Carrera family were known as *Carreristas*; in Mexico the adherents of Iturbide formed a political faction; and in Colombia the devoted followers of Bolívar eventually founded a Bolivarian party. In many sections party issues continued to be dependent in the main upon the achievements of party leaders. Political action was frequently influenced by the attitude of prominent families and there was even a tendency toward the formation of ruling oligarchies or dynastic political groups. Here and there political parties took sides with regard to the type of government existing in their respective countries. In other sections party alignments were determined by the relative influence of civilian or military classes in the administration. In many countries religious issues provoked bitter political dissensions. Almost everywhere the distribution of the spoils of office was the great issue in political conflicts, which sometimes developed into civil wars. In fact the struggles of political parties were not infrequently mere contests between the "ins" and the "outs." In certain states more or less acrimonious controversies with foreign nations seriously complicated the problems of domestic politics.

Political parties in Latin America have been designated by many different names: in Argentina the leading parties were the Unitarians and the Federalists; in Venezuela, the *Azules* and the *Jaunes*; and in Uruguay, the *Blancos* and the *Colorados*. Although not always known by the same name in different countries, probably the most significant and long lived party alignment was that of the Conservatives and the Liberals. The Conservative party, composed mainly of the clergy and influential landowners, stood in general for the maintenance of the established regime in politics and religion, the retention of large landed estates by the ruling aristocracy, the exercise of special privileges by Catholic ecclesiastics and a close relation between church and state. Occasionally this party became a clerical faction. On the other hand, the Liberals stood for reform in politics, which generally included a democratic system

of political organization, the abolition of special ecclesiastical privileges and the complete separation of church and state.

Party practices as known in the United States have developed very slowly in Latin America. Very often the control of a party was in the hands of political leaders residing in the capital of the country. Frequently the chief executive of the respective state undertook to exercise a dominant influence upon the national elections. For a long period even in Argentina, Brazil and Mexico a succession of military commanders monopolized important national offices. When such chieftains were elected to the presidency or when they became dictators they often used the soldiery to intimidate voters and to secure the forms of political action which they desired. In Central America this militant policy occasionally led an ambitious president to undertake armed interference in the political affairs of a neighboring country.

After a clique or a party had remained in power for some time, a tendency almost inevitably manifested itself toward the formation of a political party which supported the administration. A rudimentary political machine was thus brought into existence, constituting a bulwark in support of dictatorial rule. In local districts the management of political affairs was often in the hands of a few leaders who maintained intimate relations with political chieftains in the capital city. Except in rare cases party leaders in Latin America during the nineteenth century made no effort to frame a platform which would furnish a program for political action. Politicians often deliberately refrained from making any declarations as to political issues that might serve to guide the voters.

During the last decades of the nineteenth century, in the A B C countries at least, there was a marked increase in the political influence of middle class liberals. In Chile there appeared various new factions professing descent from the old Liberal party, including the National party, the Radical, or progressive, party, the Democratic, or Labor, party and the Liberal Democratic party. Coalitions or alliances of parties and factions often took place. A striking indication of changing times was the founding in Argentina in 1890 of the so-called Radical party as a protest against the domination of the National party, which was controlled by aristocratic and by conservative

tive elements residing mainly in the capital city.

Early in the twentieth century fresh trends became apparent. National issues began to gain inclusion in the platforms of political parties. Foreign influence became clearly apparent in new party alignments and in electoral reforms. Ruy Barbosa, the distinguished Brazilian publicist and presidential nominee in 1910 of the newly formed Liberal Republican party, formulated a party program which threw its chief emphasis upon the popular will and thereby repudiated the older type of militaristic domination. Socialistic groups or parties came to play an increasing part in the political life of Argentina, Chile and Mexico. Reforms in election methods were introduced into a number of countries. In 1912 President Roque Sáenz Peña of Argentina signed a law introducing the modified Australian ballot system into his country. In 1925 a new constitution adopted in Chile made a concession to the unrepresented classes by providing that proportional representation should be used in the election of senators and deputies. To eliminate the danger arising from election disputes a Chilean electoral tribunal was created to scrutinize the returns in presidential elections. In Chile and Argentina there may now be found political machinery in the form of local committees, party conventions and organizations for the nomination of candidates for important national offices.

In 1930 and 1931 uprisings in Spanish America caused important political changes which promise significant reforms in the conduct of party affairs. In 1930 a military revolution in Brazil led by the defeated candidate of the Liberal party for the presidency overthrew the conservative administration, which was supported by the coffee planters. As a result a new constitution for Brazil is under contemplation and fresh political alignments will probably result. In Argentina, Bolivia, Peru, Ecuador and Chile revolts against dictatorial rule overthrew the existing regimes and installed new parties which have made repeated and loud professions of liberal principles. President Leguía of Peru, who since 1919 had exercised the power of a dictator so despotically that parties opposed to his administration had practically disappeared, was deposed by a military revolution led by Colonel Sánchez Cerro. After a military dictatorship was overturned in Chile in July, 1931, Arturo Alessandri, an ex-president and a Moderate

Socialist, was elected president by a large majority. In September of the same year an Argentinian faction known as the National Democrats, which was apparently composed largely of the old conservative elements, displaced the personalist faction of the Radical party which had been dominated by the veteran leader, President Irigoyen. In some cases there were unmistakable signs that these spectacular changes were directed against nepotism, graft, excessive taxes, misapplied loans and government by corrupt cliques. The time is ripe for a new alignment of parties in the leading Latin American countries.

WILLIAM SPENCE ROBERTSON

JAPAN. The two major political parties of Japan are the *Seiyukai* and the *Minseito*. The parent of the *Seiyukai* was the *Jiyuto*, founded in 1881. The *Minseito* line runs back to 1882, when the *Kaishinto* was organized. Rivalry between Itagaki Taisuke and Okuma Shigenobu, leaders respectively of the *Jiyuto* and the *Kaishinto* and also of the Tosa and Hizen clans, prevented fusion into one party. The formation of both parties was due to dissatisfaction on the part of their founders with the distribution of offices, a distribution too favorable in their view to the Satsuma and Chōshū clans. They organized parties to agitate against clan control and to prepare for the new order which the establishment of a parliament was expected to inaugurate.

The two parties controlled a majority in the House of Representatives from their first appearance in 1890, and they consistently obstructed budgetary action, until within six years they had forced an oligarchical government opposed to parties to recognize the necessity of establishing working relations with them. From sporadic alliances with both parties the leaders of the Chōshū clan passed to formal headship of the *Jiyuto*, when in 1900, after the failure of a coalition with the *Shimpoto*, that party was reorganized as the *Seiyukai*. The *Seiyukai* has had continuously closer contacts with the traditional forces which sway the government and in consequence it has remained the larger and stronger. Its tendency is toward conservatism and imperialism; its support comes largely from the country districts.

The *Shimpoto*, as the *Kaishinto* was renamed in 1896, was reorganized in 1910 as the *Kokuminto*, which continued until 1922 as the most liberal group in the Diet, led vigorously by Inukai but never attaining a large membership.

It was disrupted in 1913 by the defection of more than half its members to a new party, the *Doshikai*, which in turn was changed in 1915 into the *Kenseikai*, led by Count Ōkuma. In 1927 a group of seceders from the *Seiyukai*, who called themselves the *Seiyuhonto*, joined with the *Kenseikai* to form the *Minseito*. The *Minseito*, drawing its support largely from the cities, is more liberal and internationalist than the *Seiyukai*. It has to its credit the manhood suffrage act of 1925 and the London Naval Treaty.

Neither party, however, represents the people of Japan in any real sense; they are both primarily alliances of politicians, industrial leaders and large landowners. So closely are they affiliated with the great vertical trusts that they are commonly dubbed the *Mitsui* and *Mitsubishi* parties respectively. Scandals involving bribery by business concerns seeking special legislation have been so frequent that criticism of the parliamentary system has become widespread and vehement. Elections are regularly followed by numerous convictions of candidates and their supporters for corrupt practises. On the other hand, it is appreciated that the courageous liberalism of such leaders as Ozaki Yukio, Hamaguchi Yuko and Inukai Ki, for which the latter two suffered assassination, has had results which have in part compensated for the derelictions of their weaker colleagues. While both parties have opposed the so-called Fascist movement, both have been embarrassed by Fascist elements. This movement grew out of the general disgust with the weaknesses of party politics intensified by the depression and strengthened by the prestige gained by the army in the Manchurian adventure. Instigated by army and navy officers, it is aimed at the power of capitalism and consequently at the whole parliamentary system, which is held responsible for that power.

Criticism has not yet affected membership rolls or voting strength. In 1930 the *Seiyukai* had 3,000,000 members, the *Minseito* 2,600,000. In the election of 1932 the former polled more than 5,500,000, the latter about 3,300,000 votes, out of a total of 9,500,000. The *Seiyukai* returned 304 members, the *Minseito* 147, the *Kakushinto* 2 and the *Kokumin domei* 5. In the previous election in 1930 the *Minseito* won 273 seats, the *Seiyukai* 174, the *Kakushinto* 3 and the *Kokumin doshikai*, a business men's group, 6. In the interval the *Seiyukai* had acceded to power. The government party, thanks to its absolute control over election machinery, has

never lost an election; in all but one election it has won an absolute majority.

Passage of the manhood suffrage act in 1925 brought labor and farmer parties on to the scene. These have suffered from severe governmental restrictions, poverty and interparty rivalry. Their members come chiefly from the unions of laborers and peasants and they have all espoused socialistic principles. The principal existing proletarian parties were organized by a process of coalition in 1932, following a general split caused by the growth of national socialism. The growing communistic movement is prevented by law from participating openly in party life. Labor elected 8 members in 1928 but was reduced to 5 in 1930 and 1932. Labor's largest poll in 1930 totaled about 500,000 votes.

Those members of the House of Peers who are elected by large taxpayers divide along major party lines. The remaining members are grouped in some half dozen parties, which are distinct from but at times make working arrangements with the lower House organizations. The *Kenkyukai*, largest of the Peers' parties, tends to friendship with the *Seiyukai*, while the *Doseikai* inclines toward the *Minseito*. Rank and status rather than principle distinguish the groupings of the upper House from one another.

Although the Japanese explain the almost canine devotion of party members to their leaders rather than to the parties themselves as a feudal heritage, this trait might otherwise be viewed as an importation by students of American and European parties along with other features of party organization and procedure. This together with the lack of party tradition is responsible for the fluidity of Japanese parties. The defection of a leader from one party to another or into a new party draws with him the large group who are his personal followers before they are members of the party. The organization of the parties does not differ essentially from the western model. Men of tried ability and leadership are chosen president of a party or of its executive committee by an annual conference composed of Diet members, ex-members and prefectural delegates. Great reliance is placed on a small group of advisers, party elders of experience and wisdom. Younger members are appointed directors and secretaries. Regional officers, committees and conferences carry on the work in the prefectures and localities. Party life is vigorous and, in spite of its deficiencies, promising.

PARTNERSHIP. The essence of partnership lies in joint contribution of either labor or property or both for the purpose of economic activity, joint control of such activity and the division of the resulting profits or losses between the contributors. The device is of great antiquity, provision having been made for it among the Babylonians from the time of Hammurabi, among the Babylonian Jews at least as early as the fourth century B.C. and in Roman law; in thirteenth century England there were partnerships regulated by guilds merchant.

Roman law distinguished between associated interests arising from contract (*societas*) and those arising out of testamentary disposition and in other ways (*communitas*): the types of *societas* recognized were communal ownership by a group (probably derived from old tribal custom), partnership "in everything which comes from gain," partnership in a specific business venture, partnership in the acquisition or sale of one or more specific things and partnership in the collection of taxes. The last type had many corporate attributes. The law of partnership in England rested until 1890 on a long series of decisions based upon Roman law, the common law and the Law Merchant; the influence of the Law Merchant being evident in the limitation of the concept of partnership to active cooperation in business and the exclusion of passive ownership in common. The Partnership Act of 1890 (53 & 54 Vict., c. 39) codified a large part of the body of common law, but did not touch upon the mode of administering partnership assets in the event of the death or bankruptcy of a partner or the method of disposing of the goodwill of the partnership, particularly the use of the firm name upon the termination of the association. It introduced some minor changes concerning the manner in which a partner's share of the partnership assets could be made available to meet his separate judgment debts. This statute provided the basis of the American uniform partnership law, which was accepted in 1914 by the Conference of Commissioners on Uniform State Laws and which was in operation in 1931 in eighteen states and in Alaska.

Although in some American states partnership agreements must be in writing and filed with a state official, in England and the United States generally a partnership may be established by contract without formality. The partners must be legally competent persons: corporations may become partners only with statutory authorization, and minors may generally void a partnership contract upon attaining majority. In common law jurisdictions in which no statutory provision has been made women are prohibited from entering into partnership with their husbands or with other persons, and a partnership ends upon the marriage of a woman partner. The purpose of the contract must be legal and consideration is required, but cooperation in the business is generally regarded as sufficient consideration. The relations between the partners are usually governed by the terms of the contract and, where these are inadequate, by the general law. In the absence of agreement to the contrary profits are divided equally. Partnership ceases with the expiration of the agreed term, the death, withdrawal or bankruptcy of a partner, or the declaration of war between countries of which the various partners are citizens. Any partner may contract on behalf of all the partners within the reasonable scope of the partnership activities, but he may not withdraw his share of the assets or mortgage or speculate with the partnership property without the consent of the others. Usually a majority of the partners acting in good faith may bind the minority in matters arising in the ordinary course of business, but may not without specific authorization change the nature of the business or expel a partner. General partners participate in the management; silent or dormant partners share in the profits but not in the management; secret partners are those whose membership in the partnership is not published; nominal partners are persons who become liable as partners by allowing themselves to be so regarded. Since the Companies Act of 1862 (25 & 26 Vict., c. 89) the formation of a partnership of more than twenty members or ten if the partnership is formed for the purpose of establishing a bank

has been illegal in England, but there is generally no such limitation in the United States, the unincorporated joint stock company (*q.v.*) being virtually a large partnership.

In relations with non-members of the partnership every member whether general, silent or secret is fully liable for all the debts of the partnership. The law of England, but not Scotland, and of the states of the United States excluding Louisiana, is peculiar in its rejection of the business usage of considering a partnership an entity separate from its members. In effect, however, Anglo-American law has been forced to apply the entity theory in a number of situations. In view of the unlimited liability of every partner for the debts of the partnership, great importance attaches to the circumstances under which an individual is legally considered a partner. An individual acting in any transaction so as to give reasonable justification for the belief that he is a partner is estopped from denying liability in connection with it. Prior to the decision in *Cox v. Hickman* [8 H. L. C. 268 (1860)] in England, receipt of a share in partnership profits was believed to constitute the recipient a partner. Since this decision and the passage in 1865 of Bovill's Act (28 & 29 Vict., c. 86) in England and their acceptance in American decisions, the receipt of a payment contingent upon profits or the sharing of net returns no longer establishes partnership, nor does joint tenancy, tenancy in common, joint property or common property; a coowner may therefore dispose of his rights without the consent of the other owners and incurs no liability as a partner. Modifications of the general law have been made in certain fields. In the United States and England mining partnerships are not dissolved by the death of any member of the partnership; members may be substituted at will and partners work in common. Agreements between landowners and tenants which provide for the sharing of profits and for the contribution of capital to the agricultural enterprise by the landowner are held not to establish a partnership. A partnership for the purpose of a single venture is usually called a joint adventure; a syndicate or participation association is also essentially a partnership.

In continental Europe partnership has been common (*société en nom collectif* in France and *offene Handelsgesellschaft* in Germany). Continental law in contrast with English and American recognizes the partnership as a legal entity. In most European countries a written partner-

ship contract and its registration are required but in other respects continental partnership law is broadly similar to British and American.

In a limited partnership at least one member is liable without limit for the partnership debts while the remainder are liable only to the extent of their agreed contribution to the partnership capital; limited partners are not permitted to participate actively in the affairs of the partnership, and their death, bankruptcy or withdrawal does not terminate it. The Code of Hammurabi recognized a form of limited partnership and Jewish law at least as early as the third century A.D. provided forms by which the liability of all partners might be limited. The modern history of the limited partnership probably dates, however, from the *commenda* of the Middle Ages in Italy when members of the nobility, for whom it was illegal or disgraceful to enter into trade, commended their money to merchants who employed it, sharing profits with the lender who was neither openly associated with the venture nor responsible for losses beyond his contribution. The *commenda* was an important vehicle of mediaeval commerce and is still recognized, as, for example, in the *société en participation* in France and the *Gelegenheitsgesellschaft* in Germany; it is usually formed to conclude one or a few transactions. The limited partnership in France, the *société en commandite*, was first regulated in 1673, the present law being mainly a codification of such early ordinances. Provision is made also in Germany for the *Kommanditgesellschaft*, in which the unlimited partners are called *Komplementäre*. In the *Kommanditgesellschaft auf Aktien* the rights of the limited partners are represented by shares and in the *stille Gesellschaft* some "partners" are undisclosed and receive only a fixed interest on their investment. The relationship of the latter to the other members of the firm is, however, that of a creditor rather than of a partner. Permitted in Ireland between 1780 and 1862, limited partnerships were rare because of the cumbrous provisions of the law. John Stuart Mill advocated limited partnerships in England but they were not permitted until 1907 when the Limited Partnerships Act (7 Edw. VII, c. 24) was passed; but the authorization of "private incorporated companies with limited liability" had rendered the act almost unnecessary, and between 1908 and 1930 only 1183 limited partnerships were registered in England. During 1930 there were only twenty registrations with a total capital of £63,112.

In the United States provision for limited

partnership was first made in 1822 by a New York statute which many states adopted during the succeeding thirty years. By 1931 nineteen states and Alaska had enacted the uniform Limited Partnership Act, but in the United States provision for loans to a partnership in return for a share in profits without incurring unlimited liability of a partner has minimized the practical importance of these statutes. The uniform act provides that limited partners shall be members of the association but not strictly partners; that a person may be at the same time both a general and a limited partner in the same partnership, such an individual having all the rights and powers and being subject to all the restrictions upon a general partner except that concerning his contribution he has the same rights in relation to other members as if he had not been a general partner. The withdrawal or substitution of limited partners does not terminate the partnership. Almost all the states which have not adopted the uniform act have made other provision for limited partnership. Partnership associations such as those authorized in Pennsylvania and Michigan resemble corporations more than partnerships since the liability of all members is limited. They have, however, many of the attributes of partnerships; for example, shares cannot be transferred without the consent of a majority of the partners.

Partnership probably developed in response to the need for joining the capital of one with the labor of another. The condemnation of usury among the Jews and Christians for long obstructed loans but permitted, and thereby stimulated, partnerships between capitalist and business man. At least as early as the third century A.D. it was held commendable among the Jews for the wealthy to enter into partnership with the needy. Among the Babylonian Jews of the fourth century B.C. and among the Christians in the Middle Ages it was ruled that participation in partnership profits without risking the loss of capital was usurious but that the risking of capital justified the receipt of a share of the earnings. In England partnership declined in importance as a means of evading the usury laws during the sixteenth century when legal control was diverted from the prohibition of all contracts involving the payment of interest to the regulation of the amount of the interest charge. Partnership was employed also as a means of evading the local monopolies of guilds merchant.

Partnership was an especially common form

of business organization in mediaeval Europe in banking and trade. With the development of other businesses which required more than a modest amount of capital, partnership was applied also to them. Coal mining, a great source of speculative temptation in England, was financed mainly by partnerships, often family affairs, until the end of the seventeenth century. When the goldsmiths of the city of London turned to banking in the seventeenth century and merchants outside London followed their example in the eighteenth, many organized their businesses as partnerships. The Act of 1708 (7 Anne, c. 7) forbidding the issue of notes by any bank which had more than six owners, with the exception of the Bank of England, had the practical effect of giving the latter a monopoly of joint stock banking and placing all other banking in the hands of individuals and partnerships of restricted size until 1834, when joint stock banks began to appear in England. The cotton mill and engineering undertakings of the late eighteenth and the early nineteenth century were organized as partnerships in both England and New England; Carnegie operated his steel manufacturing enterprise as a partnership for many years. But with increases in the amount of capital required, the partnership gave place to the joint stock company, first in foreign trade and mining, then in banking and, during the latter half of the nineteenth century, in most manufacturing fields. Partnership remains important in the professions where it serves to insure continuity of service and specialization and where corporate organization is excluded by statute or by the rule of professional organizations. It survives also in investment banking and in some branches of trade in which capital is easily acquired on loan and in which the speedy action of the partnership is valued. In 1931 about 4.4 percent of the income reported under the American federal income tax acts was derived from partnerships.

The decline of the partnership is attributable mainly to its failure to meet the increasing need for concentrated control of capital: large partnerships are unwieldy in action and involve each member in heavy risks. Moreover the partnership is at a disadvantage because it must be terminated and reorganized upon the death or withdrawal of any member. On the other hand, it is less confined in its scope than a corporation, more cheaply and speedily set up, involves less publicity and where small is more nimble in action. The *commenda* and the limited partner-

ship, by providing a partial divorce of ownership from control, meet the need for the concentration of capital and the greater concentration of control, but the corporation does these things even better, providing for an easy transfer of interests and requiring no one to undertake unlimited liability.

PARUTA, PAOLO (1540-98), Venetian political theorist and historian. Paruta's diplomatic and official career in the service of the Venetian republic began with the ascent to power of the new nobility. It was the ideas and aspirations of this class that he sought to express in the series of dialogues published under the title *Della perfezione della vita politica* (3 vols. Venice 1579, new ed. 1599; tr. by H. Cary, London 1657). The wide fame enjoyed by this work was shared by Paruta's posthumously published *Discorsi politici* (2 vols., Venice 1599; reprinted in *Collezione di ottimi scrittori italiani*, vol. xxv, supplement, Pisa 1825, pt. ii), an inquiry into the causes of the greatness and decline of ancient Rome and of mediaeval Venice. Here in an analysis which was not without influence upon Montesquieu, Paruta sustained the thesis that states can preserve

themselves only by remaining faithful to the principles upon which they were founded. The prosperity of Rome he laid to moderation, fortitude and discipline; its ruin, to excessive expansion and the relaxation of its hardy traditions. In the discourse on Venice Paruta declares that in order to enjoy a durable peace the state must maintain a proper balance between its various component elements—a conception which was subsequently applied by Botero to the sphere of international relations. Both in his *Storia vinetiana (1513-51)* (Venice 1605, new ed. in *Degl' istorici delle cose veneziane*, vols. iii-iv, Venice 1708; tr. by H. Cary, London 1657) and in his *Storia della guerra di Cipro (1570-72)* (written 1574 and incorporated in *Storia vinetiana*) Paruta revealed a profound understanding of the necessity of relating the internal history of any state to the development of other peoples. His reports and accounts in *La legazione di Roma (1592-95)* (in *Reale Deputazione Veneta di Storia Patria, Monumenti Storici*, 4th ser., vols. vii-ix, Venice 1887) and other collections displayed a penetrating insight into the political, economic and moral conditions prevailing in the Papal States.

Like other Italian political thinkers who reflect the thought of the Counter-Reformation, Paruta was an anti-Machiavellian. He gave a unique emphasis, however, to the problem of the relationship between politics and morals. Whereas Machiavelli was interested in the means whereby a prince or nation may achieve power, Paruta was concerned primarily with the formulation of rules of civic conduct suitable for the citizens of a republic. Among the recurring themes of his political ethics are the natural necessity of social existence, the superiority of the active life to the contemplative, the satisfactions of participating in public affairs, the limitations of arbitrary rule by man as compared with government by law and the unequalled advantages inherent in the mixed form of government. While in recognition of civic virtue the state should bestow public honors, the intrinsic reward should be consciousness of merit. The modernity of Paruta's thought is reflected in his case against the glorification of poverty and in his defense of the function of wealth, which he describes as an indispensable prerequisite to the perfect human life and as an incentive to progress. But mindful of the commercial decadence then afflicting Venice, he included among the responsibilities of the state the task of holding the quest for gain within

satutory limits. Paruta's thought reveals some fundamental contradictions, not always reconcilable through recourse to that moderation upon which he so frequently insists. Thus, despite his arguments in defense of the right to freedom, he tries to vindicate slavery and the privileges of a noble caste. And, particularly in the closing pages of the *Dialoghi* (written 1572) and still more emphatically in the *Soliloquio* (written c. 1593; reprinted with *Discorsi politici*), he ends his searching attempt to construct a practical political ethics by subordinating civic life to religion.

II, 153-282.

PASCAL, BLAISE (1623-62), French philosopher and mathematician. The son of a scholar of reputation, who watched over his education, Blaise Pascal showed extraordinary precocity, particularly in mathematics. His *Essai pour les coniques* (1640), which he printed at the age of sixteen, enunciated a fundamental theorem in projective geometry. Soon afterward he invented the arithmetical triangle—a device for determining the coefficients in the expansion $(a + b)^n$ —and engaged in physical researches which were to culminate in his famous experiment on the Puy de Dôme, the decisive verification of Torricelli's hypothesis on the effects of atmospheric pressure. He opened up the path to the calculus of probabilities, which inspired him later to put forward the famous argument demonstrating to libertines that there is every advantage in betting on the side of religion. Also the mastery with which he handled the difficult operations of the geometry of infinitesimals makes him a direct precursor of Leibniz and Newton in their invention of the differential and integral calculus.

Pascal's works manifest a power of concrete intuition in mathematics and a regard for physical experimentation in complete opposition to the spirit of Descartes, which implies a purely analytical method and an a priori construction of the world. Pascal was even able to derive from

his work a philosophy which already outlined one of the main theses of positivism—the progress of the species prolonging itself across the generations of individuals through the accumulation of scientific discoveries, as if humanity constituted a single individual living through the centuries at different ages of its own existence.

Now what constitutes Pascal's originality is that after defining in masterly fashion this conception of intellectual progress, which is at the basis of modern civilization, he refused to admit that it corresponds to the true destiny of man. According to him the destiny of man is turned entirely in the direction of the beyond. Neither our origin nor our destiny can be explained intellectually; they belong to a supernatural order, which is sensed by the heart and which is expressed in charity.

Entering the circle of the friends of Port-Royal in 1646 Pascal attempted to combine the practise of a rigid Christianity with the career of a scientist and man of the world. He went through several crises of estrangement from the world of fashion, ending up with a night of luminous ecstasy on November 23, 1654, when he made the vow of "total and tranquil renunciation," which he observed piously during the eight remaining years of his life.

Into this new existence he brought the gift of concrete precision which was the mark of his genius. The *Lettres provinciales* (1657) are masterpieces of both the *esprit de géométrie* and the *esprit de finesse*. The first carried to the extreme the demands of a morality that was sincerely Christian and did not permit of serving two masters at the same time; the second unmasked one by one the abstract formulæ, seemingly framed for juridical and secular purposes, behind which lay hidden the complaisance of the casuists. He forced the faithful Christian to scrutinize his own conscience, laying bare the depths of desire and the libido which testifies to the persistence of the original sin.

Pascal's polemic dealt a mortal blow to his Jesuit adversaries, without, however, definitely saving Port-Royal, which was accused of Jansenism by the Vatican and which Louis XIV suspected of designs of political independence. The tactics of the *Grand Monarque* are indeed a commentary on Pascal's doctrine that the respect of the people for the majesty of the sovereign is nothing but an effect of imagination, which is no doubt beneficial since it assures civil tranquility but which is without intrinsic value or rational foundation.

Pascal is, however, very far from the skepticism which has often been attributed to him. No one felt more deeply the need of truth and "the thirst for justice." But because he wanted truth and justice to be absolute he suffered when these aspirations clashed with the feeling of incoercible human impotence. He addressed himself to the religion of the God-Man, the religion of the Word made flesh, since this religion alone unravels the psychological enigma of man, the dualism of his grandeur and misery, which it translates into the double perpetuity of Adam the sinner and Jesus the Redeemer. The *apologie* projected by Pascal was thus to have had its roots in the analysis of the human soul and was to have put us directly face to face with the alternative created by the fear of divine justice and the hope of merciful grace, the alternative of an eternity of salvation and an eternity of damnation, in accordance with that irreducibly mysterious decree of a hidden God.

Pascal lived through this alternative in his most intimate being, rejoiced by the miracle of the Holy Thorn which God performed during the height of the controversy over the *Provinciales* on the person of his niece, Marguerite Périer; meditating Christ's night of agony on the Mount of Olives, when Jesus was deserted by His disciples and abandoned to the wrath of God; finally redoubling the tortures of illness with the practise of a rigorous asceticism.

If the influence of Pascal, which has been decisive in the history of positive science, in the history of French literature and in the history of Christian thought, continues to be felt in our own day, the reason is that no work invites us more to pass beyond discursive abstractions and to uncover by direct contact with the realities of nature and of the soul the springs of vivifying intuition.

LÉON BRUNSCHVICG

Works: The definitive edition of Pascal's works is that by Léon Brunschvicg, Pierre Boutroux and Félix Gazier in the *Grands Écrivains de la France* series, 14 vols. (Paris 1908-21). A briefer edition, containing less editorial material, is that by Fortunat Strowski, 3 vols. (Paris 1923-31). The *Pensées* has been translated by C. Kegan Paul (London 1885), and the *Lettres provinciales* by Thomas McCrie (London 1846).

R., *Pascal, a Study in Religious Psychology* (London 1909); Cousin, Victor, *Études sur Pascal* (5th ed. Paris 1857); Sainte-Beuve, C. A., *Port-Royal*, 9 vols. (new ed. Paris 1926-28) vols. ii-iii.

PASCOLI, LEONE (1674-1744), Italian economist. Of Pascoli's life little is known except that he was an abbot in Perugia. He is remembered primarily as the author of *Testamento politico d'un accademico fiorentino in cui con nuovi, e ben fondati principii si fanno varj e diversi progetti per instabilire un ben regolato commercio nello stato della chiesa*, published anonymously in Perugia in 1733 under the false imprint of Cologne. The title is reminiscent of the *Testament politique du Maréchal de Vauban* (2 vols., Paris 1707-08) of Boisguillebert; but although Pascoli was influenced by the French economist, he did not follow him entirely, retaining a certain independence in his method of inquiry. Moved by the deplorable conditions in the Papal States, the result of a "lack of proper laws and taxes," he proposed a series of measures concerning trade, taxes, money and finance. He recommended particularly the restoration to the farmers of their ancient prerogatives and advantages, such as "the privilege of buying and selling foodstuffs and live stock in the markets and fairs in preference to all other privileged persons"; and he urged the exemption of cattle from all excises, the abolition of internal duties and of all restrictions hindering the free sale of grain on foreign markets. His program for the encouragement of industry is thus summed up in his own words: "The export of manufactures should be encouraged by means of bounties after the English fashion, their import should be prohibited, and the only imports to be admitted free should be raw materials used in home industries." While Pascoli was inspired essentially by the principles of agrarian protectionism, he accepted a modified mercantilism and advocated adoption of a monetary policy which would insure an inflow of money exceeding the outflow. He made important suggestions concerning the restoration of agriculture in the Roman Campagna, among them the establishment of farms, the requirement that landowners must improve the soil and particularly the reform of taxation. Taxes should be proportional to income, whether de-

rived from land and other immovable property or from industry, commerce and from movable investments in general, and should be coordinated equitably with the revenue from excises and the various governmental licenses and contracts. Above all, trade and industry should not be upset, no opportunities should be given to fiscal agents for oppressing the public, the money should be collected with the least expense and should reach the treasury in the shortest time possible. Pascoli's views are interesting especially in that they suggest proportionality between direct and indirect taxes and indicate norms for the art of taxation.

AUGUSTO GRAZIANI

PAŠIĆ, NIKOLA (1845-1926), Serbian and Yugoslav statesman. Pašić received his early education in his native Serbia and in 1868 was sent on a government scholarship to study engineering at the Polytechnicum in Zurich. There he came into contact with the most advanced political ideas of the time and became a disciple of Bakunin. Upon his return to Serbia he allied himself with the socialist leader Marković and in 1881 organized the Radical party. During the early years of Pašić's leadership the party had a thoroughgoing agrarian-socialist program, but later on when he had attained power he modified his position considerably and in his old age was frankly conservative, especially as regards social questions. Nevertheless, for many years Pašić fought valiantly for popular rights, for constitutionalism and for parliamentary government in opposition to the Obrenović despotism and as a result suffered exile and imprisonment. During his exile in Bulgaria from 1883 to 1889 he became thoroughly imbued for the first time with Marković's doctrine that a Serbian-Bulgarian alliance would be the initial step toward a union of the Balkan peoples and to the destruction of Ottoman and Hapsburg power, while his stay in St. Petersburg, as ambassador from 1893 to 1894, confirmed his belief that Serbia must embark upon a Russophile policy.

In 1906 following the restoration of the

Karageorge dynasty Pašić was appointed prime minister, a post which he held again from 1909 to 1910 and from 1912 to 1918. Essentially a practical politician, he became one of the most significant figures in Balkan politics as well as in diplomacy, where his infinite patience, his taciturnity and his reluctance to commit himself helped assure his success. Within Serbia he enforced a constitutional regime and by carefully biding his time carried out his foreign policy, first in the Serbian-Bulgarian alliance of 1912 and later in the joining of Serbian and Russian interests against Austria-Hungary in the World War. Accused by a number of historians of having known of the Sarajevo plot, Pašić consistently denied any knowledge of it or any desire for war. Certainly he did not foresee clearly the results of the collapse of Ottoman and Hapsburg power. He tended always neither to forestall nor to precipitate events but merely to strike, with almost infallible instinct, at the proper moment.

Although Pašić's policy led to the organization of the Kingdom of the Serbs, Croats and Slovenes and although he signed the Corfu declaration, he was by no means a protagonist of the Yugoslav idea. He knew very little of the Croats and Slovenes and, rooted in the ideology of the Greater Serbia movement, he fostered during the World War the idea of a union of all the Serbs as against a union of the southern Slavs. Pašić headed the Yugoslav delegation to the Paris Peace Conference and was prime minister of Yugoslavia from 1921 to 1926; but the new state always appeared to him to be essentially a greater Serbia and in accordance with this concept he put through, against wide opposition, the strongly centralized Vidovdan constitution of 1921 which has so frequently come into conflict with the federalist tendencies of the various ethnic groups.

PASSIVE RESISTANCE AND NON-CO-OPERATION. Passive resistance to violence or wrong, whether committed by an individual or by the state, has been at all times a characteristic

practise of oriental peoples. Always an integral part of the religions of the East, it entered the western world through Christianity. Stripped of this mystical origin, it reappeared as tax resistance on the eve of the English civil war, and in such forms as nationalist protest, general strike or organized resistance to war has become in modern times an important method of political struggle.

The ideas from which it originated in the East derive from the most primitive thinking of mankind. To this day in India a man who has suffered wrong from a neighbor, for example, by the non-payment of a debt, will sit down before the latter's door and starve himself to death. The threat usually suffices, for if the victim should die his ghost would haunt the wrongdoer. The closing of the bazaar as a general protest against any form of oppression is probably linked with the same idea, for in India it has a quasi-religious character and is observed as a day of mourning (*hartal*). A deathlike abstention from the normal activities of life, it operates against someone and is intended to put him in the wrong and to expose him to moral or, more properly, to spiritual sanctions. From time immemorial it has been the one effective form of resistance to oppression known to the subjects of eastern despots. A variant of it is the use of the right of asylum practised en masse, whether at sacred shrines or, as in modern Persia, in embassy gardens.

Such methods suit the unwarlike character of many oriental races; but they also derive from eastern mysticism in its lower as well as its higher forms. An Indian yogi practises austerities to gain power: by controlling the microcosm of his body he may command the universe and subject the gods to his will. He demonstrates also the unreality of this world of appearance and attains by renunciation the true spiritual reality. Buddha transformed this primitive idea of renunciation to gain ghostly power by introducing the element of love for those on whose behalf one sacrifices oneself. Gandhi, preparing to starve himself to death on behalf of the untouchables, meditated on the legend that Buddha in a previous incarnation had offered himself to a hungry tigress. But equally his fast was directed against the orthodox Hindu leaders and his own unworthy disciples. His suffering or death would shame them and expose them if not to spiritual retribution at least to public censure.

These traditional Indian elements blend in the elaborate technique, first of passive resistance to a specific wrong and then of complete non-

cooperation with a government based on force, which Gandhi evolved, first on behalf of the Indian immigrants in South Africa and later to achieve India's independence (*see* INDIAN QUESTION). Those who practise his teaching fully must be ascetics (e.g. completely chaste), must renounce all violence, must love the enemy, must learn to regard his power and his acts of coercion and violence as unrealities; by so doing they attain inner freedom and liberate India. The typical act of passive resistance consists in a calm "non-violent" refusal to desist from one's purpose, conceived as right in itself, in spite of the commands or violence of authority. Indians bent on demonstrating in a forbidden place will squat upon the ground and remain there day and night, even in the face of beating by the police; and they will not resist if carried to prison. Untouchables asserting their right to use a temple or a sacred tank will squat in this way indefinitely before the barrier. They treat an immoral power and its commands as non-existent. To this mystical doctrine, however, has been added a more worldly political technique, in part of western origin notably tax resistance, including the refusal to pay agricultural rents and the cutting down of the revenue from salt and liquor. The boycott of foreign goods is a thoroughly eastern expedient, having been used previously by the Chinese.

This oriental pattern of thought probably influenced stoic thinking, although the stoics never advocated organized passive resistance: at the most they admired the wise man who would endure violence and wrong with calm aloofness. The wise man should cultivate indifference to fortune and the good things of life: he stands above pleasure and pain; he remains unmoved amid the blows of ill fortune or the assaults of oppression; by contemplation he makes his own intellectual climate. This was the individualistic pessimism of men who hoped for little from society and disdained the roads of escape offered by superstition. But it was not a form of resistance designed to overcome or to remove evil. Rather it steeled the wise man against evil by enabling him to ignore it. Although stoicism in some degree affected later generations of Christians, the teaching of the Gospels rested on a different psychological approach. Its root idea—that non-resistance, if prompted by generous love, would shame, win and "overcome" the violent man—is much nearer to Buddha's moral intuition. Turning the other cheek and still more clearly the injunction "Whoever shall com-

pel thee to go a mile, go with him twain" are more suggestive of yielding to melt the violent man than of the defiance, however mystically passive it may be, of Gandhi's technique. The Christian rule is thus non-resistance to evil rather than passive resistance. Its tradition, laid down by St. Paul, is obedience in its own sphere to the civil power; passive resistance, with no social or political object in view, was offered only to the command to sacrifice to "idols." The application to war of the doctrine of non-resistance, although it may possibly be traced farther back in history, appears as a sharply formulated Christian belief derived from a study of the Gospels, first among the Cathari and the Albigenses and then among the Anabaptists and the Quakers. Some of the Anabaptists, such as those who for a time controlled the city of Münster, were fiercely militant; but other Anabaptist groups rejected violence. The right wing Anabaptists, the Moravians, condemned oaths or resort to law courts, the bearing of arms, any forcible resistance to wrong or any acceptance of office under the secular ("Caesar's") state. It is probable that a continuous tradition stretches from the mediaeval Cathari through the Anabaptists to the Quakers.

Passive resistance, although with no object in view beyond a mere refusal, becomes inevitable by this doctrine when the state demands an oath or requires military service. On the first count Quakers in England were constantly imprisoned in the seventeenth century, but their rejection of violence was first tested on a great scale in the World War. The Military Service Act of 1916, known as the Draft Act, provided exemption for those who could prove a "conscientious objection" to war, usually interpreted to mean a religious objection. In practise exemption was usually made conditional on the undertaking by the objector of some "work of national importance," such as ambulance service or more usually agriculture. The more resolute refused this concession on the ground that any aid to a nation at war is morally a participation in it and went in thousands to prison. Although this radical opposition to all war began mainly among Quakers, it soon enlisted others whose standpoint was socialist rather than specifically Christian. Stressing at first non-resistance as a duty of the individual, it soon came to regard it as an expedient for stopping war or for preventing its outbreak. The attempt is steadily being made, both in England and on the continent, to organize as "war resisters" young men who will refuse

the call to arms. A few individuals in France, Poland and elsewhere are stubbornly refusing military service. A movement to pledge refusal to engage in war under any circumstances has made some headway among English and American universities. The doubt is whether in the hour of mob excitement men will stand together unless linked by closer ties of party or church, and again whether negative opposition alone can end war without a constructive program for organizing peace.

The most radical and interesting development of the Christian doctrine was made by Tolstoy. Following, as had the Anabaptists and Quakers, the two commands "Swear not at all" and "Resist not evil," and also the command "Judge not, that ye be not judged," his commentary involved a complete rejection of any organized, policed state, of all use of force and of course of all national churches. An oath, involving the surrender of the individual conscience, is the necessary basis of armies and of the whole coercive apparatus of a modern state. Resistance to evil is condemned not merely on the usual psychological or ethical grounds—that it engenders anger and so prevents both the resister from persuading and the wrongdoer from perceiving the wrong—but rather because it can be made effective only by the building up of a conscienceless apparatus of coercion, itself a worse evil and the buttress of worse evils than any criminal or national aggression could possibly inflict. While Tolstoy bases himself on a reinterpretation of the Gospel, his criticism of modern industrial society owes much both to the rationalist and quasi-anarchist individualism of the eighteenth century and to modern socialism, although he was far from either of these positions. That his creed would be fatal to any elaborate urban civilization in no way disturbed him: it was indeed his revolt against civilization, including its science and its art as well as its wars and industrial slavery, that drove him back to Galilee. Like Gandhi he would base society on the peasant and the village. These two prophets had much in common and even exchanged letters, but Tolstoy never advocated, still less organized, mass passive resistance. He had no expedient for bringing to an end the evils of the coercive state save the conversion of individuals to Christian anarchism. He left behind him in Russia a few disciples who try to live by his rule, but his intellectual influence on his generation throughout the world was perhaps greater than that of any contemporary thinker. One may

doubt whether he turned many back to primitive Christianity, but in the minds of countless readers he created or strengthened a deep uneasiness about all the assumptions that underlie the authoritarian state. In this Russian prophet as in his younger contemporary Gandhi the negative, ascetic pessimism of the East came to life once more. Non-resistance flowed from the rejection or reversal of all the conventional values of the life of the senses and indeed of modern western civilization.

From a wholly different line of thought, typically western and unconnected with religion, there arose in the eighteenth century an attitude toward government which has occasionally inspired passive resistance. The French *encyclo-pédistes*, starting with an individualism derived from Locke, had analyzed all government into a series of institutions reenforced by superstition, which dwarfed the citizen and prevented him from attaining the full stature of humanity. At best government was a necessary evil, and the typical view of this school was that it should be limited to a rapidly vanishing minimum. Condorcet and Thomas Paine were unorthodox and modern in discovering many valuable functions which this necessary evil might perform. Godwin and his anarchist communist intimates believed that a virtuous man might, by relying on the ascendancy of his own reason, defy force and shame those who threatened to use it. They extolled this sort of individual heroism, to be displayed by fearless speech and on occasion in court. But a good man must not provoke martyrdom; neither must he organize passive resistance, since all association has in it seeds of evil. Shelley was an ardent supporter of this view and carried it in vision far beyond the pedestrian wisdom of his master, as in his vivid depiction of passive resistance to armed tyranny in the *Masque of Anarchy* (stanzas LXXXV-LXXXVI), which describes exactly the moral effect which Gandhi a century later expected from civil disobedience. The noblest and most eloquent statement of this essentially anarchist individualism came a generation later in Thoreau's essay on *Civil Disobedience* (in *Writings*, vol. x, Boston 1893, p. 131). But rigid individualists must not organize, and Thoreau's essay inspired in his immediate time only sporadic acts of defiance, like his own refusal to pay the taxes of Massachusetts. Years later Gandhi read it as a student in London, and it became part of the pattern of his thinking out of which evolved organized mass passive resistance. But in itself Thoreau's essay

points only to individualist non-cooperation with the state.

In modern western history the more influential acts of passive resistance have rarely flowed from any theoretical attitude to society and government, whether religious or anarchistic. They have been expedients, improvised in the rough and tumble of political struggle. Such was John Hampden's act, when he called his neighbors together and signed with them a pledge to refuse payment of ship money. But Hampden and his friends had no theory about the peculiar virtue or efficacy of passivity in resistance, and in due course they drew their swords for the Parliament. The theory of the general strike, however, as worked out by Benbow, Owen and their successors, has played a real role in the labor movement. The early suggestions for a general withdrawal of labor to wrest reforms from a reactionary government were not translated into action, but they were never forgotten by the socialist movement; and a whole literature of speculation grew up, especially in France, around the idea of the general strike as a revolutionary method. On the eve of the World War it was favored in the left wing of the socialist movement as a means of resisting a government bent on war. The obstacle to its use is not merely that such a government would mobilize the strikers and shoot resisters, but that the working class itself must be assured that the workers in the enemy country will take equal and parallel action. Otherwise, as the French Socialist Compère-Morel said, it "could only assure the defeat of the best-organized proletariat."

A few victorious instances of this use of the political strike are known in modern history. The Russian general strike of 1905 led to the promise of the First Duma; but its victory was obscured by the failure of the subsequent armed rising in Moscow. Wholly successful was the general strike led by the socialists and the labor unions in Germany in March, 1920, against the Kapp Putsch, after reactionary troops had occupied Berlin and put the republican government to flight. It had public opinion generally behind it and saved the republic for twelve years. Very gallant but not so indisputably successful was the passive resistance of the people of the Ruhr to the French occupation in 1923. Refusing to operate the railways, telegraphs or telephones or to raise coal which might be used for reparations, the resistance was in effect a general strike, covering the major services and industries, lasting

for over eight months. The spirit and discipline of the workers under the severest privations were superb, and few acts of violence or sabotage marred it. It broke down because the German government, which financed the resistance of the Ruhr by inflation on a fantastic scale, had finally to desist when faced with bankruptcy. France indeed learned a salutary lesson as to the limits of military power, but the cost to Germany was an impoverishment from which it never wholly recovered.

It is just as difficult to evaluate the effectiveness of Gandhi's use of passive resistance as to estimate how far his use of mixed oriental and western techniques from 1930 to 1933 influenced the British government to offer an Indian constitution which, much as it fell below Gandhi's demands, was nevertheless a concession. Many thousands of Indians showed a high order of devotion, but the mass of the supporters of Congress were after a time intimidated, partly by imprisonment but chiefly by beatings administered by the police, so that overt acts of defiance virtually ceased. The police were more brutalized than shamed by the exercise of systematic violence; nor was public opinion in England moved in any degree. The Indian government undoubtedly suffered much inconvenience and a heavy loss of revenue in the earlier part of the period. Probably the more effective part of this mixed strategy was its more mundane and less spiritual side—the trade boycott and tax resistance. Gandhi's individual self-martyrdom on behalf of the untouchables has certainly hastened their emancipation.

Only a rash theorist will draw from this record any confident conclusion as to the efficacy of passive resistance, whether against war or against the oppression of a nation or class. It presupposes for success a rare degree of solidarity. One is disposed to think that it must have a limited and preferably a negative objective and that this must be capable of achievement in a brief period of time. The Kapp Putsch was practically defeated over a week end, and this negative victory merely restored the status quo. In this instance as also in the Russian strike of 1905 a homogeneous body of workers was acting for the immense mass of the nation. Gandhi, with an illiterate mass to lead, unaccustomed to organized action of any kind, was compelled to strike slowly, a district at a time. He aimed at a crescendo of pressure, but the first line was exhausted before the reserves came up—and he never had Moslem support. "In theory irresist-

ible, in practise very difficult" is perhaps the only sober verdict possible in an evaluation of passive resistance as a political technique.

PASSPORT. A passport is a document delivered by the public authorities to the person specified therein, authenticating his identity and permitting him to travel either in the territory of his own state or to depart from it and enter that of another. A passport may be issued for internal or for foreign travel. It may be a discretionary document, granted at the request of those who desire to facilitate their own travels, or it may be compulsory for all travelers. Especially for internal travel the compulsory passport system imposes a limitation on the right of transit and consequently upon individual freedom; it serves as an instrument of policy, enabling the authorities to watch all movements of persons. The passport for foreign travel, the only kind known in the United States, is of importance to the holder as a certificate of citizenship and a guaranty of protection abroad by diplomatic agents of his country. It is frequently completed by a visa, an endorsement granted by the country of entry denoting that its authenticity has been examined and that the bearer may be permitted to proceed on his journey. In addition to these two most important categories there are various special passports: the diplomatic passport accords special privileges to diplomatic agents and to persons entrusted with certain official duties; the maritime passport is a paper permitting the captain or master

of a ship or vessel to proceed upon a voyage; the military passport, granted in time of war and authorizing movements within a belligerent's sphere of operations, is a safe conduct rather than a passport proper and is granted to the bearer by the country in control of the territory.

In antiquity and in the Middle Ages the passport was granted as a special privilege to only a small number of persons. It was unknown in antiquity for foreign travel, for there was little intercourse between the citizens of the various states, which in general regarded one another with suspicion and which were scarcely ready to accord validity to documents issued by any other government. Even the few internal passports differed in nature and purpose from the modern type. In the period of the Roman Empire, diplomas and special papers (*tractoria*) were granted as a favor to messengers and other persons. The holders of these documents had the right to avail themselves of public horses, enjoyed certain traveling facilities and were guaranteed some degree of protection as regards their persons and their goods. The *tractoria* naturally had validity only within the confines of the empire. The *lex cornelia de falsis* punished any counterfeiting of such passports. In the Middle Ages royal envoys and foreign ambassadors were provided with documents which entitled them to particular privileges while traveling. With the extension of commercial relations passports were in certain instances granted to merchants to insure their protection.

The modern system of compulsory passports developed in the sixteenth and seventeenth centuries. Such passports were not only a measure of policy but also a means of protection against the increasing hordes of mendicants and vagrants who had become a menace to safe travel. In addition passports were employed to control the movements of special classes of persons. Thus they were instituted in eighteenth century France to enable beggars and vagrants to return to their own country and to prevent their agglomeration; and as a safeguard for the secrets of French industry they were required for artisans who wished to leave the country. In the German states special passports were required for citizens capable of military service (*Militärpass*), in order to prevent desertion and enrolment in foreign armies, for persons proceeding from territories infected by epidemics (*Pestpass*) and for Jews traveling through the country (*Judenpass*).

The French Revolution brought about a more widespread application and a stricter organization of the compulsory passport system. In the first years of the revolution the liberal principles which then prevailed led to the suppression of passports. The constitution of 1791 proclaimed complete freedom of transit as one of the natural, incontestable and inalienable rights of man. Within a short time, however, the establishment of a severe passport system as a means of control was necessitated by the menace of political emigration, the desertion of soldiers and their flight abroad, the acts of brigandage and the invasions of vagrants, as well as by the requirements of national defense. Accordingly the National Assembly in 1792 prohibited all persons without passports from traveling in France and from entering or departing. Successive laws, especially those of 1793 and of 1795, confirmed this prohibition and made it stricter. For similar reasons and in an attempt to prevent the spread of revolutionary ideas as well as for purposes of reprisal the compulsory system was shortly thereafter introduced in nearly all European states with the notable exceptions of England, Sweden and Norway. In this way the passport, formerly a discretionary document granted at the request of travelers in order to assure their protection or at most a document required only of certain classes of persons, was transformed into a compulsory official paper, limiting individual freedom and imposed upon all solely in the interest of the state.

The liberal doctrine that the state must not hinder freedom of transit within its territory except when public order necessitates restrictions gradually came to prevail in the nineteenth century and was even sanctioned in some constitutions. The system of compulsory passports for both internal and foreign travel was at first mitigated and later suppressed except during times of emergency. Necessity for travel in connection with increased trade, the development of other forms of state surveillance, such as efficient police systems, fast means of travel and the telegraph, all served to contribute toward this result. By 1914 the compulsory passport system was abolished in almost all states. In Europe it operated in Rumania, Bulgaria, the Austrian provinces of Bosnia and Herzegovina, Russia and Turkey; in the latter two countries a rigid internal passport system was employed by the police as a means of control and supervision, for the purpose of defending the autocratic governments of those countries from

revolutionary attacks. The system survived also in Persia and in Colombia, Guatemala, Haiti, and Uruguay.

In the United States the passport, in the nineteenth century, was a certificate of citizenship granted to citizens who wished to travel or reside abroad. Before 1856 there was no law regulating the granting of passports; they were issued not only by the secretary of state but also by consuls, governors of the states and other local authorities and even by notaries. After the law of 1856, which was enacted because foreign governments refused to recognize the validity of locally issued documents, passports were delivered within the United States by the State Department and in foreign countries by diplomatic and consular authorities. Subsequent acts permitted the issuance of passports to citizens of the insular possessions of the United States and to aliens who had begun but not completed their naturalization. No passport was required for entrance into or for residence in the United States. An exception was made during the Civil War, when all Americans and foreigners had to present a passport on entering the country.

In the confusion produced by the World War, not only did the compulsory passport reappear both for foreign and for internal travel, but it was used much more generally and strictly than ever before. During this time of general suspicion, of constant vigilance against military espionage and of food shortage it seemed the only means of controlling aliens and of assuring the protection of the military and economic interests of the state. The return of peace did not bring with it a return to freedom from travel restrictions, except in regard to internal passports, now obsolete in all but a few countries.

Economic, social and political reasons contributed to the maintenance of a strict compulsory passport system for foreign travel despite the obstacle that it sets up against free communications between states. The severe economic depression which followed the war, affecting both defeated and victorious countries, the widespread unemployment consequent upon the demobilization of millions of men, the removal of populations after the treaties of peace, the revolutionary disorders, the monetary crisis and the strong protectionism of most governments combined to prevent a return to the liberal pre-war regime, as did also the political changes, such as the Russian Revolution, which produced a very large number of refugees, and the disorganization of communication services

and of state administrations. Every nation felt obliged to prevent the entry into its territory of unemployed, vagrants, spies, political agitators and persons indulging in exchange speculations and generally to limit and control the entry of foreigners.

The new principles for the administration of emigration and immigration problems were also factors in maintaining the passport system, which seems to be an effective instrument of control. Many countries, particularly in North and South America, reduced and limited the number of entrants and settlers both because of the increasing difficulty in assimilating masses of newcomers of various races and civilizations and in order to protect native workers against foreign competition. In countries where there are marked trends toward emigration there is a growing tendency to limit freedom of exit, and states endeavor to accomplish this by a systematic control of migratory movements. The passport has become compulsory everywhere, and visas for entry, exit and transit are required by many governments. In the United States also the World War brought about a change from the earlier policy; the wartime measure of 1918 requiring passports and visas for all aliens entering the country and providing that citizens were not to leave its territory without passports was made permanent by an act of 1921 and by subsequent acts which increased rather than mitigated the severity of the system.

After the war the visa, in addition to serving as a means of regulating immigration, was frequently used to keep out political "undesirables" or was granted to them only upon certain conditions. Count Károlyi, former premier of Hungary, succeeded in obtaining a visa to enter the United States only after he had pledged himself not to discuss political matters during his stay, while Countess Károlyi was refused a visa because of her alleged radical political views. After his exile from the Soviet Union in 1931 Leon Trotsky was unconditionally refused visas by the governments of Germany, Norway, England, Denmark and other countries.

The legislation of many countries contains severe measures against all persons who succeed in entering fraudulently into their territory without a passport and visa. Such illegal entrants are generally expelled and are sometimes also penalized. Special administrative services are employed in the search and pursuit of these persons in the United States and Canada. In some countries, as in the United States, the

introduction of identification papers for the purpose of stricter supervision has been advocated.

In the U. S. S. R., Germany and Italy the passport regime is now a means of sustaining dictatorship and is applied with very great rigor. No one may enter or leave Soviet territory or travel within its confines unless he has special permission, and everyone who enters or attempts to leave without a passport and other specially required authorizations is subject to imprisonment or fine. In Italy no passport may be granted without previous permission from the police, and this permission is never given to opponents of the Fascist regime. An Italian who attempts to leave his country without a passport is punished by imprisonment and fine.

The League of Nations, since its formation, has tried to set up a uniform system of passports with a view to their gradual abolition. An international conference held in Paris in 1920, while recognizing the impossibility of a complete return to pre-war conditions, recommended the introduction of a uniform type of passport, the exclusion of any fiscal features, the limitation of certain kinds of visas and the simplification of all formalities. The recommendations of the Paris Conference were accepted by only a few governments and with many reservations. According to the wishes of numerous international organizations, the Sixth Assembly of the League in 1925 adopted a resolution urging the abolition of the compulsory passport system to as great an extent as possible. A second conference on passports, held at Geneva in 1926, expressed the hope that special agreements between various states might bring about a gradual return to pre-war conditions. No appreciable progress has been made in this respect, with the exception of the abolition of visas and the facilitating of control formalities by numerous special agreements. The charge for visas, which is still high in some countries, is, however, tending to become lower, for while such taxes may be a source of revenue to a government, there is often a greater fiscal advantage to be gained from the increased tourist traffic which may result from reduction or abolition. Passport fees also have on the whole been lowered.

After the World War one of the special problems connected with passports, that relating to the need for special identity cards and traveling permits for Russians and other refugees, attracted the notice of the League of Nations, which succeeded in solving it to some degree through the unfailing zeal of Fridtjof Nansen.

At a conference held at Geneva in 1921-22 it was decided to introduce a special certificate for Russian refugees. On presentation of this "Nansen passport," which does not of itself entitle the owner to return to the country which has issued it, the refugee may be admitted to the state to which he intends to travel, either after a visa has been affixed or after he has received a certificate permitting him to cross the frontier. By 1928 fifty-one governments acceded to the agreement relating to this certificate and accepted the obligation to recognize its validity. In 1924 thirty-one states and by 1928 thirty-eight states in all applied this system to another large group of refugees, the Armenians. In 1928 the Nansen passport was further extended to Assyrians, Assyro-Chaldeans and Turks who had lost their nationality. Proposals for a still wider and more liberal extension have failed because of the opposition of various states. Individual countries have, however, adopted the proposals of the League and now issue passports to those of their residents who, as a result of the political upheavals connected with the World War, are without a nationality (*heimatlos*) or who, for various reasons, cannot obtain a passport from their own country or are ineligible for Nansen certificates.

PASSY, FRÉDÉRIC (1822-1912), French economist, social reformer and pacifist. Passy's economic liberalism was deeply influenced by Bastiat, Laboulaye, Cobden and Bright, but he

gave its principles a more decided slant and application with regard to positive social reform. He considered that nature's resources are sufficient to enable man to live and prosper providing he does not interfere with the free play of natural laws. Despite his liberalism, however, his emphasis on the social and moral aspects of economic problems led him to a modified individualism. In accord with the conception of society as "an exchange of services" he emphasized solidarity in the relations between capital and labor—hence the necessity of arbitration of labor disputes and social peace—and solidarity in the relations between nations—hence the necessity of arbitration of international disputes and world peace. War upsets the harmony of international life and profits no one. But war, poverty and nearly all of man's sufferings are the result of his own passions and ignorance; the supreme task is therefore to enlighten man in order that he may become master of his own destiny. Passy sought to realize these principles by a lifelong struggle for social reform, particularly for the extension and improvement of popular education and the compulsory arbitration of international disputes. In 1867 he formed the International League for Permanent Peace, which after the Franco-Prussian War became the French Society of the Friends of Peace; in 1889 he organized, with Randal Cremer, the Inter-Parliamentary Union for Arbitration and Peace. He was awarded one half of the Nobel peace prize in 1901. Passy identified pacifism with the cause of labor and democracy and all three with that of progress and humanity.

PASTEUR, LOUIS (1822-95), French chemist and bacteriologist. Although Pasteur's career properly belongs to the history of chemistry,

biology and medicine, social thought also may claim the great Frenchman by reason of the far reaching social applications of his discoveries. Born in southeastern France of peasant stock, Pasteur early revealed himself a persevering student and was admitted to the École Normale, where he decided to devote himself to chemical research. His first work dealt with tartaric acid crystals and their rotatory action on polarized light. That this dry field of chemical research should have led by gradual stages to the discovery of a vast new empire of biological phenomena is a tribute both to the power of the experimental method and to Pasteur's persistence in following the trail wheresoever it led.

The empire in question is the role of microbic life in the twin processes of fermentation and putrefaction. Mid-nineteenth century science, fresh from its chemical conquest of biological phenomena, including the artificial synthesis of a typical organic product like urea, rebelled at any attempt to interpret these processes in terms of a specifically biological factor. Thus in the process of alcoholic fermentation, which had been closely studied, it was felt that quantitative chemistry explained the reaction sufficiently when it showed, for example, that sugar broke up into alcohol and carbonic acid and that the weights balanced. But what about the action of yeast? Yeast had at length been shown to be a living organism, but the proponents of the chemical theory of fermentation, headed by Liebig, insisted that the yeast played a role only in so far as the *dead* cells served as a chemical catalyzer to start and speed up the reaction, in which the yeast otherwise took no part. To attribute a direct and active role to the living cells seemed to Liebig a recourse to the occult entity of a vital force, which the progress of physics and chemistry had labored to banish; besides there were other fermentations which proceeded without yeast or any other form of life, so far as had been observed.

It was Pasteur's destiny to transform this question from a futile debate between abstract mechanism and abstract vitalism into a subject of progressive experimental inquiry. His work on crystals had shown him that the optical property of molecular dissymmetry, or the ability to rotate polarized light to the right or to the left, was traceable to an ultimate organic, or biological, origin of a particular substance; later Pasteur discovered that a certain plant ferment attacked only right handed but not left handed crystals, which are chemically of the same com-

position. Here was one clue to indicate that life as life may have a specific physicochemical behavior not met with in purely inorganic matter. Thus already inclined toward the biological interpretation of fermentation, Pasteur was able to demonstrate in a historic paper on lactic fermentation (published 1858) that the fermentation of milk into lactic acid was produced by a specific micro-organism, acting as a ferment, and that this micro-organism could produce lactic acid from a large number of substances provided the nutritive elements and the physical conditions were appropriate to its activity. Following this paper he was able to show further that every fermentation process—e.g. wine, beer—required a specific living ferment or group of ferments and that fermentation was not so much a chemical decomposition of the fermentable material as the result of the metabolism of the micro-organisms.

The solution of the problem of fermentation and putrefaction, with its important human corollaries in the way of control of infectious disease, seemed in sight. But before the final solution could be assured, it was necessary to overcome the objection that micro-organisms were produced spontaneously and that from this point of view they were as much an accompaniment of fermentation and putrefaction as the cause. Hence the truly epoch making importance of Pasteur's experiments refuting the theory of spontaneous generation and establishing the proposition that microbic life can come only from previous living germs. The differential techniques by which this thesis was experimentally established still constitute an object lesson in scientific method at its best and highest.

Even had Pasteur's work not gone beyond this point, the practical human benefits would have been enormous. The British surgeon Lord Lister, following Pasteur's demonstration of the role of microbes in fermentation and their origin from previous germs, revolutionized surgery by reducing infection through aseptic and antiseptic methods. Pasteur himself showed that the dread scourge of puerperal fever epidemics in lying-in hospitals was due to a germ infection, spread very often by the unclean methods of the attending physician himself, and that the infection could be avoided by germicidal methods. Indeed for many types of infectious diseases simple antisepsis—killing off or reducing the number of germs—is sufficient to prevent the spread of disease. The technique of milk

pasteurization to prevent typhoid fever is a simple case in point.

For other infectious diseases it is necessary to isolate and study the life history of the germ in pure cultures. In connection with the isolation and study of the anthrax bacillus, which was first accomplished by the German bacteriologist Koch and independently repeated by Pasteur, the French scientist developed the third phase of his work, which is a technique for attenuating the virulence of a particular microbe by cultivating it under detrimental physical conditions or in unfavorable animal hosts. Such attenuated cultures when inoculated into the blood of an animal or a human being produce a mild attack of the disease and stimulate the organism to protect itself, thus providing immunity against more severe infections in the future. This is of course the method which Jenner had followed unconsciously in using cowpox as a protection against smallpox. As a result of Pasteur's demonstration of the general principle a whole series of vaccines and antitoxins against specific diseases has been developed, and the principle is ever leading to new applications as well as to fruitful theoretical investigations whose fertility is still not exhausted.

Pasteur's discoveries accelerated the social revolution in the treatment of disease. Under industrialism individual health was becoming more and more an object of public concern, but the new technique for the isolation of contagion and for the fighting of disease by vaccines and antitoxins made state participation in medicine indispensable.

Works: *Oeuvres de Pasteur*, ed. by P. Vallery-Radot, vols. i-vi (Paris 1922-33).

Consult: Vallery-Radot, René, *La vie de Pasteur* (Paris 1900), tr. by H. C. Devonshire, 2 vols. (London 1901); Duclaux, Émile, *Pasteur: histoire d'un esprit* (Sceaux 1896), tr. by Erwin F. Smith and Florence Hedges (Philadelphia 1920); "L'œuvre de Pasteur et ses conséquences," symposium by P. Vallery-Radot, Charles Moursu, and others in *Revue Scientifique*, vol. lxi (1923) 417-75.

PASTOR, FREIHERR LUDWIG VON (1854-1928), German historian. Pastor was born in Aachen and was the son of a Protestant father and Catholic mother. It was not until after his father's death in 1864 that his Catholic education was begun. During his earlier studies at Frankfort on the Main he came particularly under the influence of the Catholic historian

Johannes Janssen. He continued his studies at Löwen, Bonn, Berlin and Vienna and taught at the University of Innsbruck from 1881 until 1925. In 1901 he became the director of the Austrian Historical Institute in Rome and in 1920 was appointed Austrian ambassador at the Vatican.

Pastor was an amazingly prolific writer. He wrote biographies of the Catholic leaders Janssen, August Reichensperger, Max von Gagern, Archdeacon Heinrich and Franz Kaufmann and of the Austrian military heroes Conrad von Hötzendorf and Viktor Dankl, prepared the last edition of Janssen's *Geschichte des deutschen Volkes* (8 vols., Freiburg i. Br. 1913-24), edited the *Erläuterungen und Ergänzungen* (10 vols., Freiburg i. Br. 1898-1920) and contributed over two hundred articles to various periodicals. His great fame rests, however, on his monumental *Geschichte der Päpste seit dem Ausgang des Mittelalters* (16 vols., Freiburg i. Br. 1886-1932; English translation ed. by F. I. Antrobus and R. F. Kerr, 22 vols., London 1891-1932).

Pastor like his master, Janssen, was firmly convinced that history should be placed at the service of the church. He envisaged no possibility of contradiction between Catholic dogma and history and believed that those historical views which are conditioned by dogma are always identical with historical truth. The papacy therefore can be clearly understood only when viewed as a divine institution whose historical development was divinely determined. Pastor's work, however, reveals a tremendous amount of erudition and was epoch making in that it elucidated for the first time the history of all the pontificates from 1378 to 1800 on the basis of the vast archive materials of the Vatican. Doubts have been expressed as to his impartiality in the selection of documents and criticisms have been made of his treatment of many of the individual problems, especially of his distinction between the Christian and pagan aspects of the Renaissance, but his work remains one of the monuments of modern historical research.

PATENTS. The modern patent system has its background in the monopolies and exclusive privileges of the Middle Ages. The kings began to stimulate the introduction of new manufactures and the supply of natural and artificial products by granting monopolistic privileges to towns and merchant and craft guilds. This motive of encouraging trade was weakened, however, by the growing necessity of the kings to secure money or services. The grants thus served to reward court favorites and to raise annual tributes for the sovereign. The grantees sold the privileges at high prices to persons who imposed severe burdens on their use. Gradually even necessities of life came into the hands of patentees. The monopoly was made known by the issue of *Litterae patentes* (Open Letters), addressed to the subjects of the sovereign so that the privilege granted should not be questioned for want of knowledge. In England the abuse of exclusive privileges and monopolies was ended during the reign of James I by the famous Statute of Monopolies enacted in 1623, which abolished the restrictive privileges and established an exception in favor of new inventions. It formulated also for the first time in history the requirements for the grant of a patent and the limitation in time of the privilege and did away with arbitrary administrative action. In the United States in 1790, after the constitution provided in article I, section 8, clause 8, that Congress should have power to promote the progress of science and the useful arts by securing for limited times to inventors the exclusive right to their discoveries, a statute was passed adopting the principles of the English act. On the continent the exclusive privileges and monopolies of the Middle Ages continued until the end of the eighteenth century. Two French laws of 1791 enacted the first patent legislation in France. In Germany some of the individual states passed similar legislation after 1815, while the general principles for the whole of Germany were first laid down in the Zollverein convention in 1842.

The law of each of these four countries constitutes in many respects a system apart, conditioned by different legal tradition and administrative policy and technique and by a different way of adjusting and harmonizing conflicting interests and claims. There has, however, been mutual influence among the philosophies of these systems. Thus the original British idea that a patent was a monopoly and should be regarded with disfavor by the law has yielded

before the French theory of the inventor's right as a natural right and the German idea of a bargain between the inventor and society. The British system has been followed in most parts of the British Empire; the German, especially by the Scandinavian countries, Holland, Austria and Hungary. The French system has influenced the rest of civil law countries. The economic rationale of all the patent systems now rests on the theory that society rewards the inventor with the exclusive franchise to exploit his invention for a limited time, in recognition of his service in putting society in possession of a new idea and on condition of his disclosing it to the public by describing it in his application for a patent.

The first question to consider then is what are the new inventions for which a patent will be granted. A positive definition of patentability, however, is hardly given in any law, except that the patent laws usually prescribe negatively that certain things may not be patented. In the most important countries patentability is to be gathered only from judicial pronouncements in particular cases. The general requirement may be said to be that the invention to be patented must be new; that is to say, it must be something which was not previously known or used by others and must not have been dedicated to the public by the inventor. But again the definitions of novelty vary. In this respect there are three groups of countries. In France and the many countries whose law is similar an invention is not deemed new if, prior to the application for a patent, it has received in any manner sufficient publicity, either in the country in which the patent is applied for or in any other country, to make possible its use. In a second group of countries, which includes those of the British Empire, the facts of publication or prior use which will bar the grant or invalidate a patent are ordinarily only those that take place in the country where the patent is applied for. The third group of countries, to which the United States and Germany belong, distinguishes between publication of the invention by printing or by public use: the former is fatal to the novelty of the invention, regardless of where it takes place, while public use is material only when it occurs in the country where the patent is applied for.

An invention may have all the general elements of patentability yet be unpatentable because of express exceptions in the law. Inventions concerning articles which are state monop-

olies are of this class. Foodstuffs, chemical products, medicines and pharmaceutical products are also often included in such exceptions, although generally the processes for making them are patentable. In most countries patents are granted for new industrial products, machines or instruments as well as for new processes; namely, methods of manufacture for producing, by known implements, something in a cheaper or more expeditious manner or of a better and more useful kind. Industrial designs, that is, creations pertaining to the form and ornamentation of articles rather than to their usefulness, are subject matter of design patents in the United States and some other countries. They are, however, copyrighted by registration in most of the other countries. The latter procedure is more in accordance with their true nature as artistic designs. France, Belgium and a few other countries have regulated designs in a rational manner by identifying them with artistic property in general and protecting them without the requirement of any formality; their registration is thus entirely optional.

The legal regulations concerning the filing of applications for patents and the administrative procedures leading to the grants of patents are determined by the attempt to balance and secure various interests. The law first purports to make sure that the inventor is granted a privilege for no more than the specific discovery made by him. It then aims to secure him against infringement of any part of his invention but not to prevent improvements of the original invention by others. With this end in view it seeks to enable interested persons to obtain full notice of the patented invention, so that they may avoid infringing the patent while its term lasts but be in a position to use or manufacture the invention freely when the patent expires. The law attempts to balance the conflicting interests of the inventor, competitors and the public by requiring of the inventor a full and precise disclosure and description of the invention. Regulations of an extremely technical character exist as to the form and content of the application, the preparation of drawings and the like. Of outstanding importance are the regulations concerning the delimitation of the invention. The application must contain a "specification," or technical description, of the invention. Most countries also require the enumeration of "claims." In the United States in particular, the inventor must give a final and conclusive enumeration of specific and distinct claims—all improvements,

operations, features or advantages included in the invention and every new idea which is implied in every part of the invention or in the combination of different parts or details. These claims may be defined quite broadly in the application, although the courts will not protect a part of an invention which has not been expressly claimed in the accepted specification. In the French patent law, however, no enumeration of claims is required. The inventor must only describe the invention and conclude it with a résumé. It is left to the tribunals to decide in any given case whether or not a special function, operation, feature or idea is covered by the patent, taking into consideration the whole of the description in relation to the prior "art." The British law represents a middle position. The specification must contain claims, but these only serve to define the monopoly. The claims are construed by the courts in the light of the common knowledge of the art at the date of the patent. Under the German law the claims are required to be very narrowly defined, although the courts will interpret them in the light of the specification. The explanation of these differences is that the French law tends to favor the inventor and is the reasonable corollary of the French administrative procedure of granting patents. The American law, although it appears to restrict the inventor by requiring him to define his invention by distinct and final claims, operates in fact to the advantage of the owner of the patent by allowing him to make very broad claims. The German law gives greater weight to the interest of industry by restricting the patent to very narrow claims. The English law strikes a more even balance between the interests of inventors and of industry.

In certain countries the administration does not take any responsibility for examining the patentability of an invention. Its task is purely that of registering the invention. If the documents filed by the applicant are in due form, the patent is issued to him. This is the system commonly known as the Latin, or French, system. In the other countries the administration is not satisfied with merely registering the invention but undertakes to investigate the claims of the applicant before the patent is granted to him. The extent of this inquiry varies, however. The American administrative procedure is the exact opposite of the French. The examination by the United States Patent Office consists in a thorough investigation of the prior art with respect to the invention claimed. Every material

device or process is disclosed in the records of the Patent Office. An application may be rejected for want of novelty or because the alleged invention is held to be inoperative, frivolous or injurious to public health or morals. No publication of the application before issue is made and no oppositions are invited by the office. But if there is a prior application for substantially the same invention a proceeding called interference is instituted for the purpose of determining the question of priority of invention. The British system consists in a limited examination by the administration as to whether the invention claimed has been wholly or in part claimed or described in an application for a patent made in the United Kingdom within the past fifty years. By a recent amendment the examination in Great Britain now will cover also foreign patents and publications. When the application is accepted the British office advertises the application for oppositions. The German system combines the American and British. The administration proceeds to an examination of the invention as to its patentability and novelty and after its acceptance the application is advertised for opposition. There are also some variants of the above types of procedure. It should be noted that the type of administrative procedure does not affect the question of the validity of the patent. Nowhere is this guaranteed by the administration. A patent is everywhere, in the United States as well as in France, subject to annulment by a court before which the invention's novelty or patentability is disputed.

The various types of administrative procedure reflect divergent administrative policies. In the United States it is considered for the best interests of the inventors themselves and of the public that the administration should investigate the invention before granting a patent. In France it is deemed that the same interests are better protected by the opposite course, since it is believed that a previous examination of the invention can never be sufficiently complete and free of errors, while, on the other hand, it involves great delay and expense on the part of inventors. It would seem, however, that the French system is not as adequate today as it was a century ago, when inventors could search for themselves and find out whether their invention was new; this is impossible today with the enormous increase and multiplication of inventions. Manufacturers and capitalists give a greater value to German, English and American

patents because of the greater certainty attached to them.

Patent privileges are granted for limited times. The term in most countries is fixed for all patents at between fourteen and twenty years. In certain countries, especially in Latin America, the inventor may elect between various terms, which do not, however, exceed twenty years, or the administration may fix the term between a minimum and a maximum according to the importance of the invention. An extension of the term is possible in these countries and very exceptionally in Great Britain, the British dominions and colonies and in some other countries.

In all countries with the exception of the United States the patentee is under certain obligations. One of these is the payment of taxes or annuities yearly or at certain intervals during the term of the patent. In recent years these taxes have been considerably increased. The penalty for failure of payment is often the forfeiture of the patent. In many countries periods of grace are now allowed. Another obligation is that of working the patent. In many countries if the patentee does not start working the invention within a certain period from the grant of the patent it is revoked or forfeited; in other countries a compulsory license to others for putting the invention into commercial use may be granted. The period within which the patented invention must be worked varies from one to five years. Furthermore in certain countries the patentee must not interrupt the working of the invention for more than a specified period. In Great Britain and the British dominions even though the patentee works his invention he may be required to grant compulsory licenses to others if the demand for the invention is not met on reasonable terms or if the trade is prejudiced by the refusal to grant licenses on fair terms. The theory of the law is that society grants an exclusive privilege or monopoly for a certain invention because of the social interest therein and that this interest is frustrated when the invention is not commercially used.

The protection of patent rights in the common law countries is secured by the suit for damages against the infringer and by the petition for an injunction against the continuance of the infringement. The latter is a more effective form of relief, and its availability in common law countries adds to the practical value of a patent. In the civil law countries injunction as a preliminary remedy is not available. The law in

these countries provides, however, for the so-called conservatory seizure of the infringing products or materials as a preliminary step to the institution of the action. The order for such seizure is issued without an examination into the contentions of both parties, so that it has not the effect on a settlement of the controversy that an injunction has in the United States. In the civil law countries there is also available a criminal proceeding involving the imposition of a fine on the infringer or his imprisonment. This has a deterring effect on prospective fraudulent infringers. The strategy of the infringer consists usually in denying the validity of the patent. This defense is not possible in Germany after the expiration of five years from the date of the patent. In the United States the validity of the patent may be attacked before any United States circuit court, but only a decision of the Supreme Court can finally determine the validity of the patent for the whole of the United States. Compromise in patent infringement cases is everywhere a very frequent occurrence, since the work of sustaining the patent in suits is long and laborious. The true measure of the patent right is of course the protection against infringement. This often depends on the nature of the invention. If the making of the invented article is easy and requires small technical skill, overhead and capital, there are likely to be many infringements. The situation is different when an invention requires complicated manufacturing processes or large capital and plant, as, for instance, in the steel industry. The practise of infringers in forming corporations, especially in the United States, adds to the difficulty of protecting against infringement. It is not practical to prosecute insolvent corporations and it is cheaper to settle with successful ones and to license them.

The international regime of patents rests today on the Convention of the International Union for the Protection of Industrial Property, which dates from 1883 and is now in force among thirty-nine countries, including the United States and practically all important countries of the world except the Soviet Union, China, India and most of Latin America. Prior to the formation of this union foreigners were especially prejudiced, not by legal discriminations against them but by the legal diversities themselves. The bipartite treaties entered into before 1883 sought to secure for foreigners the "national treatment," but this did not achieve an equality in fact between foreigners

and nationals. For instance, it did not guard against the loss of novelty of the invention in one country by reason of its publication in another country in connection with a patent application in the latter. The International Convention grants certain special rights and advantages over and above the national treatment, purporting to give a uniform solution of some important difficulties standing in the way of the protection of foreigners. Thus a right of priority of twelve months is granted in favor of foreign applicants after the date of filing a patent application in another country. This right enables foreign applicants to file valid applications in foreign countries after filing in their own country, notwithstanding the publication or use of the invention in the meantime or the filing of a similar application by another. A second advantage is that of the independence of patents granted in several countries to the same inventor for the same invention. The convention also stipulates a period of grace for payment of taxes on patents and the restoration of patents forfeited for non-payment. It places certain restrictions on the requirement in each country that a patented invention should be worked within a certain period; the grant of compulsory licenses has in principle been substituted for the obligation of working the invention.

The obtention of several foreign patents, however, is still a very complicated and costly affair in many countries. The movement for the progressive uniformity of patent law has almost spent itself. The possibilities of international patents, on the other hand, seem very remote, since this solution to be practical should mean abrogation of national patent laws, which is inconceivable at the present time; international patents would moreover be undesirable in view of the great defects of the present day patent system. A plan which does not encounter insurmountable difficulties is that of international filing of patents through a central bureau. This would save inventors time, trouble and expense and would make possible the creation of a uniform classification of patents and of an international index. This plan again would not be workable except among countries registering patents without examination into the novelty of the invention. The experience of the British Empire is in this respect instructive. The laws of the various parts of the empire are, in their fundamental principles, similar to that of Great Britain. There are differences, however, in practice and procedure, and an inventor in order to

be protected throughout the British Empire must file over forty patent applications. After the World War consideration was given to the idea of the grant of British Empire patents to be validated throughout the empire. When this was found impracticable the various colonies, possessions and protectorates provided instead for the registration of British patents subject to possibility of opposition in those colonies where the law so provides.

There are serious doubts that the theory of the patent law responds to present day economic realities. To begin with, the old fashioned independent inventor with his desire for economic reward is not the only type of inventor today. Most of the inventions are now made in the laboratories of large industrial corporations by technicians and scientists in their employ. They usually contract with their employers to assign to them all inventions made during their employment. Their inventive skill and genius are directed not so much to the discovery of new and useful things for the benefit of society as a whole as to the inventing of improvements of previously patented processes and products which make possible the perpetuation of monopolies.

Moreover in the United States more than in any other country, where the old fashioned idea of competition between small and numerous economic units has practically disappeared and where the major part of industry is in the hands of a relatively few large competing units, the patent system is replete with evils. It permits the creation of monopolies beyond the scope of a given patent and prevents the use of new inventions for the general good. It was first contemplated that the patentee's monopoly to manufacture, use and sell the invention would be outside the purview of the Sherman Act (1890). But its use to defeat the intention of this act brought about the Clayton Act (1914). Although by these acts and by decisions of the Supreme Court flagrant attempts to restrain trade and eliminate competition going beyond the scope of the patent have been prohibited, abuses still exist through patent pools and consolidations, cross licenses, monopolistic agreements concerning purchases and sales, controls of supplementary supplies and goods, maintenance of resale prices and the like. Such agreements aiming at restraint of trade usually come to public notice long after they begin to operate, and their condemnation by the courts does not affect the economic situation. Even where re-

straint of trade is not the objective, for instance, in cases of patent deadlocks when cross licenses are resorted to in order to avoid litigation and obtain the beneficial use of various incidental inventions in one field, the result in fact is the same.

The prevention of the application of new inventions for the general good is accomplished under the existing patent system by virtue of the fact that large economic units usually control basic patents. By filing new applications and delaying the grant of patents they succeed in entangling rivals through interference proceedings. They also prevent the use of improvements of inventions covered by their basic patents, since the improvements cannot be legally worked if they involve the use of the basic invention without the consent of the owners of the basic patents. Even when the patent is such that this consent is not necessary, the application of the improvements by independent inventors or rival competitors is often prevented by long litigations financed by the large means of big corporations and prosecuted by patent lawyers of great ingenuity and skill. Thus the opposition is usually bought off. The patented improvement will then either serve to prolong the monopoly of the large economic unit or will be suppressed if it involves the scrapping of existing equipment or the reduction of dividends. Although this suppression of the invention is contrary to the whole theory of the patent system, great outcries have been raised against past attempts of Congress to remedy the situation. Whatever explanations may be given for the suppression of a patented invention, there can be no excuse for maintaining its protection for the whole term of the patent and thus clogging the freedom of industry to build thereon new improvements. If it be said that the scrapping of existing equipment is wasteful, the decision thereon should not be left with the monopolistic interests but with an impartial authority which would take into consideration the whole scheme of interests involved. The "unclean hands" theory of equity might have afforded a proper remedy in certain cases had the courts not refused to apply it in patent cases.

Another very serious defect of the present patent system is the fact that no economic reward is granted to persons making scientific discoveries or discoveries of "principles" on which patentable inventions are based. Industrial progress is based on these discoveries. There is a flagrant injustice in denying a reward

to savants for the economic benefits made possible through their discoveries when such reward is enjoyed by inventors who invent applications of the scientific discoveries. International efforts for the protection of the so-called scientific property have been made during the last ten years. There are many disputes as to the best machinery for obtaining this result although there is no strong demand for recognition of their interests and claims on the part of the scientists themselves.

A general overhauling of the patent law designed to eliminate its most injurious defects is necessary, but there is little doubt that it will be strongly resisted by the ultraconservative patent bar. A single important remedy would be the establishment of an economic control at the Patent Office in order to secure the grant of fewer and better patents and supervise the working of patents in conformity with the antitrust laws and the fundamental theory of the patent system.

PATERNALISM. See PUBLIC WELFARE; WELFARE WORK, INDUSTRIAL.

PATERSON, EMMA (1848-86), English pioneer organizer of working women. Emma Smith, daughter of Thomas Smith, schoolmaster, early interested herself in the conditions of working women, apprenticed herself to a bookbinder and served as assistant secretary of the Workmen's Club and Institute Union. After her marriage in 1873 to a cabinetmaker active in labor circles they both visited the United States, where she became impressed with the organization of women in the sweated trades. Upon her return she wrote several articles exposing the sweated conditions of women's labor and in 1874 founded the Women's Protective and Provident League, an organization composed of influential men and women, including Harriet Martineau and several of the Christian Socialists. In its early years one general union and over twenty separate unions were set up. Mrs. Paterson accepted mixed trade unions finally only because they proved to be more permanent than the women's societies. As secretary to the league, as editor of its journal, as the first woman to attend the Trades Union Congress and in the numerous unions organized by her, in her own union as well as in suffrage societies, she carried on a vigorous fight for women's rights. Her final experiment, the Women's Trade Council, which was founded in 1882, was designed to supersede the league by being "independent of middle class tutelage."

Vivid experimentalist though she was, in her attitude toward protective legislation she was essentially a child of the nineteenth century, joining with the laissez faire economists in opposition to the Factory Act of 1878 on the ground that it would rob the adult of individual discretion. She differed from them in her view that trade unions added to the nation's wealth by improving working conditions. As a constant attendant and influential figure in the Trades Union Congress she insisted that the unfair competition of women would be better over-

come by the support of the men in unionization efforts than by a reliance on the state, which would discourage the development of woman's initiative.

PATERSON, WILLIAM (1658-1719), Scottish merchant, financier and economist. Paterson was born in Scotland and at an early age went to England to escape religious persecution; subsequently he migrated to America, where he engaged in the plantation trade. This phase of his life is obscure, but before the revolutionary settlement of 1688 he was undoubtedly a merchant of some repute in London, where he became a vigorous critic of government finance, a persistent advocate of currency reform and an energetic company promoter. In 1694 one of his financial schemes, the flotation of a state loan at 8 percent adopted by Montagu, William III's chancellor of the Exchequer, developed into the Bank of England. For this reason Paterson has been acclaimed as the founder of the bank; but although he was one of its original directors he had little to do with the actual foundation and within nine months was compelled to resign because, contrary to the wishes of the directorate, he had become associated with a rival institution. He next turned his attention to the flotation of the "Company of Scotland Trading to Africa and the Indies," whose aim was to colonize the isthmus of Darien. Here again Paterson disagreed with his fellow promoters; however, he accompanied the expedition to Darien as a volunteer, but had no share in the management and was not responsible for the failure of the project. He returned to England and acted as an intermediary in the negotiations leading in 1707 to the union of England and Scotland. In his writings Paterson was a vigorous and consistent exponent of the progressive economic thought of his age; he attacked debasing of the coinage, opposed inconvertible paper money and advocated free trade as against mercantilism, severely criticizing monopoly as a restraint of trade. Despite his laissez faire ideas he proposed a plan for a council of trade to develop Scotland's resources: the plan involved state action to aid manufactures and trade, including government purchase of a prescribed amount of stocks in companies, to regulate the currency and to relieve the poor,

for which purposes certain specified state revenues were to be used.

PATRIOTIC SOCIETIES. *See* PATRIOTISM.

PATRIOTISM. The word patriotism has no precise definition, and there are vague and varying ideas as to the psychological springs, historical origins and characteristic manifestations of the sentiment of patriotism. All may agree that patriotism is love of one's "country." But there is little agreement among equally intelligent and public spirited men as to what is meant by one's country, who one's fellow countrymen are, what services and sacrifices one owes them and what sort of social conduct follows naturally from the patriotic attitude. Most civil wars—those of secessionists or home rulers against unionists or nationalists, of colonials against the mother country, of Catholics against Protestants, of republicans against monarchists—have been wars between patriots. There is likewise little agreement as to whether a patriotic claim must always be honored, whatever its validity and however it may conflict with other loyalties, and also as to the social or moral values of patriotism in its usual forms of expression. What some have regarded as the most characteristic and ennobling virtue of civilized man, others have execrated as "the passion of fools" or "the last refuge of a scoundrel." Sir Robert Walpole, when he was the active political head of England in the eighteenth century, declared, in referring to the political group opposed to him who called themselves "patriots," that he could create fifty patriots overnight merely by "refusing to grant an unreasonable or insolent demand."

Whatever its values, patriotism in some form appears to be a universal attribute of man in society. Some anthropologists maintain that an ethnocentrism is stronger among primitive than among civilized men, the former making less of

a differentiation between any individual and the group to which he belongs. The savage, they hold, identifies each individual animal with its species and himself with his family, village, tribe or clan; certainly the savage who belonged and conformed to no such group was as much an outcast as the "man without a country" today. But the civilized man also merges himself with his group—of kin, neighborhood, town, trade, province, nation. All men desire to live with others of their kind, feel a sense of security and contentment in a familiar social environment and regard the permanence of their groups, of one sort or another, as essential to their own welfare. The civilized man, in the face of group differences regarded as critical, follows his savage ancestors in identifying group and group member: to the average citizen of the allied countries in the World War, every German was a Hun and every challenger of his country's war aims and policies was a pro-German; to many an American citizen deeply concerned, whether selfishly or not, over the economic policies of his country, every holder of "wrong" ideas as to what those policies should be is the victim of an "alien" influence.

There is no exact scientific explanation of the psychological origins of these group sentiments. Students of social psychology offer various hypotheses as to how far a herd instinct or a calculated and pooled self-interest and self-esteem create any sort of group allegiance. In so far as the primitive man validates this allegiance through myth and legend, it is generally on the ground of a common descent; and it is true that common descent is an operative factor in the allegiance—to the extent at least that it has actually created the group. The mythology of primitive tribes is quite commonly filled with stories of descent from heroic or divine ancestors stressing the antiquity of the tribe and often equating its origin with the origin of the world. Even the historical European peoples have a similar strain in their literatures and traditions. But students of race and nationality have differed as to how far common blood remains a dominant or essential ingredient in creating and consolidating a modern political community. An attachment to the soil, to the "fatherland," is also a familiar part of patriotism as it is at present understood: this appears among primitive peoples as soon as they establish some sort of constant habitation, and men of all times ordinarily feel happier and more secure within a familiar physical environment; affection for the

fair mountains, green valleys, silver seas and wayside flowers of the native land supplies a familiar theme for patriotic songs and poems. Other common elements in the patriotic pattern are the glorification of the country's wars and military heroes and the sense of the country's historic cultural mission with regard to the rest of the world.

As the term is more generally used, in historical writings as well as in controversial and propagandist discussions, patriotism means devotion to a political community. Patriotism, it is said, attains its most characteristic development only in a society where the state exists in its fully developed form and civic bonds and duties have come to be recognized explicitly and rated supreme among the social loyalties of man. This sort of patriotism reached a high point in the Greek city-state and the Roman empire state but disappeared or came to be very much in abeyance during the Middle Ages. In the latter period the dominant group loyalties were not territorial or political; they were narrower or wider than patriotism; feudal, ecclesiastical, vocational, municipal, loyalties superseded loyalty to the state. Especially was the Christian ideal alien to patriotism; for it sought to unite all Christendom and embodied a doctrine of man's supreme obligations in secular affairs to all humanity. Political patriotism emerged, or re-emerged, only with the rise of the modern nation state, in which the political is definitely differentiated from other social loyalties, and in the nation state it first reached its perfect form. English patriotism began in the thirteenth century, and Edward I was the first "patriot king" of England. French patriotism began early in the fourteenth century, when Philip the Fair set loyalty to the French against loyalty to the pope; it displayed its power in the expulsion of the English in the fifteenth century; and it attained its characteristic phase in the sixteenth century with the break up of Catholic unity and the great political achievements of Francis I. In the immediately subsequent centuries patriotism came to be associated with nationalism (*q.v.*); a politically consolidated people rather than a monarch, dynasty or government now constituted the ultimate object of political loyalty, and patriotic wars could be fought in behalf of popular or national interests and rights against an existing governmental regime.

In all of its manifestations patriotism appears as a force of cohesion, uniting different individuals, whatever their real motives, in devotion

to a single group regarded as supremely important to the safety and welfare of each. But patriotism, in the very same manifestations, is also divisive. A savage's attachment to his own clan or tribe seems to be measured by the strength of his hostility to other clans or tribes. Fondness for one's compatriots and dislike of aliens appear to have the same psychological roots. Pride in one's own country seems to require disdain for other countries "not so blest." The group affections of the ordinary man cannot encompass the whole world but must be concentrated upon small parts of it; and the fervor of his affection for any particular group appears to be at its highest point when that group is in hostile relations with other groups. So wars, defensive or offensive, stimulate patriotism, bringing out in sharpest relief the entity of one political community as against another; and patriotism is in turn the most effective lever for bringing on or sustaining war. Patriotic literature—history, fiction, poetry—gives full recognition to this association. Extremists among both the eulogists and critics of patriotism emphasize the association, the former extolling war because of its effects in building patriotism, the latter condemning patriotism as the principal source of war. Much of the propaganda for patriotism, by both public and private molders of popular opinion, tends to intensify its divisive effect. Textbooks in the public schools have universally, but notably since the World War in France, Germany, Italy and some of the new states of southern Europe, sought to teach patriotism not primarily by setting forth an ideal of devotion to the country's interests or by inculcating an understanding of its history, but by offering partisan accounts of the nation's intrinsic qualities and historic role and by disparaging or ignoring the virtues and achievements of other nations. Newspapers of extensive circulation, notably those of Hearst in the United States, Beaverbrook in England, Hugenberg in Germany, Coty in France, give this exclusive patriotism an explicitly martial emphasis, presenting prejudiced and inflammatory accounts of pending international issues, dealing cynically with projects for international conciliation, clamoring for increased armaments.

Private societies often support this militaristic patriotism and cultivate a still more exclusive form, making it divisive internally as well as internationally. They not only insist that the country must always be set above the rest of the world but also demand adherence to particular

policies for furthering the country's welfare and decree ostracism for advocates of other policies. This has been particularly true of numerous patriotic societies, old and new, in the United States since the World War. The older societies were formed in the first instance to instil patriotism by cultivating an informed interest in the country's "storied past"—preserving its historic sites, commemorating its great historic events, spreading knowledge of its great warriors, statesmen and literary figures. The newer societies, and the older ones in recent years, have devoted their most conspicuous activities to other ends, mainly to the advocacy of particular economic and political dogmas and to the suppression of critical discussion of these dogmas. In the name of patriotism they conduct a virulent propaganda against economic and political measures of which they disapprove—social insurance, a minimum wage, public ownership of utilities or a basic change in governmental institutions; they publicly blacklist (keep out of public offices and out of lecturing and teaching engagements) those of their fellow countrymen who protest against such efforts to restrict the free discussion of public questions; and they work for the exclusion of what they consider "undesirable" foreigners. By this sort of propaganda patriotism is made to appear peculiarly congenial to those who advocate an aggressive and defiant foreign policy or an unchallenging support of the existing economic and political constitution of the community.

The meaning and history of the term do not, however, require this identification of patriotism with either chauvinism (*q.v.*) or conservatism. That devotion to one's own country does not require any deliberate disparagement of the rights and interests of other countries has been the contention of much of modern liberal thought. The English idealist school of Green, Bradley and Bosanquet, who sought to fuse a monistic conception of the state with a liberal view of social obligations, diverged in most respects sharply from the liberal and Fabian pluralists; but both agreed on the possibility of a non-divisive and constructive patriotism. They held a genuine patriotism to be compatible with rigid respect for the sanctity of international obligations and with a policy of subordinating immediate national interests to national interests of longer standing, furthered by an international cooperation in the maintenance of peace. In fact so little essential is a militaristic attitude in the sentiment of patriotism that even a pacifist may

be a patriot, believing that war brings irremediable injuries—moral, cultural, intellectual, economic—to his country.

Radical and revolutionary social doctrines, especially in the tradition of modern socialism, have often been interpreted as having no place for patriotism. The *Communist Manifesto* of Marx and Engels declared that "the proletariat has no fatherland." A minority of the more orthodox Marxists have adhered strictly to this doctrine, even to the extent of refusing to join in a war. Their historical analysis represents patriotism as the instrument of capitalist exploitation and imperialist war, and they have regarded working class unity as more important, under all conditions, than national self-preservation. But in particular historical situations, especially in the tension on the eve of the World War, the socialist movements very generally throughout Europe succumbed to the patriotic fervor. The contemporary communist creed of a proletarian world revolution, to create a society from which all political boundaries are removed, is opposed to patriotism in any nationalist sense. But if patriotism is to be interpreted broadly, the Russian communist may be regarded as supremely patriotic in the ardor with which he devotes himself to the service of the sort of community he considers to be of the highest importance to the physical and spiritual well being of himself and all others; he works and fights for a cause higher than his petty self-interest. If patriotism and socialism are understood in the ways in which they operate in ordinary practise—the former as devotion to a particular community, the latter as a particular program to further the welfare of such a community—then clearly the two are mutually compatible.

Comfortably situated supporters of a social status quo are generally in a better position than reformers or revolutionists to lay down special qualifications for the patriot. For obvious economic and social reasons they are the country's most conspicuous and, for many, most persuasive spokesmen of the day. History, however, pays little respect to their discrimination between the patriot and his opposite. Accordingly disloyalists of one age often become patriots for later generations. Few, if any, now deny the title of patriot to Washington and Hamilton, leaders in a revolt against established political authority; to Walpole, condemned by distinguished contemporaries as unpatriotic for keeping his country out of war; to Charles

James Fox, Daniel Webster, Richard Cobden, Campbell-Bannerman and Lloyd George, who bitterly denounced their governments for waging war unjustly; or to Ramsay MacDonald, a pacifist in the World War. A mere change of party control may transform a black list into a roll of patriots. This is simply to say that citizens equally interested in their country's welfare may have opposite views as to whether maintaining a status quo or moderate change or radical innovation will best further that welfare. Patriotism, in the usage best justified by history, does not imply any particular notion as to how the patriot may serve his country most heroically and effectively.

PATRONAGE, POLITICAL. See SPOILS SYSTEM.

PATTEN, SIMON NELSON (1852-1922), American economist and social philosopher. Patten was of Scotch-Irish ancestry. He received his early education in the United States and completed his formal training at Halle, Germany. He was professor of economics at the University of Pennsylvania from 1888 to 1917, when he retired from active teaching. Patten was a master of both classical and current economics, being particularly a student of John Stuart Mill; yet he was known primarily as a critic and dissenter. As a believer in the relativity of knowledge he could not present theories as true at all times and in all places. His thought reflected the changing life of the American middle west, where he had passed the early years of his life. His method was deductive. Many of his writings have permanent value, but his greatest contribution was the invigorating stimulus characteristic of his lectures and classroom discussions.

Patten's writings covered a wide range and did not include any systematic treatise. He viewed life as dynamic and knowledge as relative, and his works appear discursive and even inconsistent, since his theories were of necessity subject to change. Perhaps his most fundamental concept was the contention that man now dwells in a surplus rather than in a deficit economy. The conquest of nature and general social progress produce an economic surplus; and in so far as this idea is grasped, not only many older theories but also many institutions are called into question. Diminishing returns and other aspects of production theory demand less attention than does the theory of consumption. The orthodox advocacy of freedom of trade may be replaced by a belief in protectionism, if it becomes thereby possible to live a more complete and satisfying life. Abstinence and hardship are less necessary than formerly; this view alters completely the outlook toward thrift, capital accumulation and interest and frequently

results in an encouragement of spending. Physical cost, as distinct from expenditure, is decreasing. Consumption may become and actually does become better adjusted to environment, and the social consequences of this adjustment are far reaching.

Such dissent from traditional theory tended to isolate Patten as a thinker but to enhance his worth as a teacher. In some particulars, as in his emphasis on a surplus economy, he foresaw clearly the trend of the times and anticipated later writings. His stress on protectionism and on nationalism was not in harmony with classical and neoclassical views and seems to have been to some extent a forecast of post-war trends.

Patten" (with bibliography by R. G. Tugwell) in *American Academy of Political and Social Sciences, Annals*, vol. cvii (1923) 333-67.

PAUL IV (1476-1559), pope from 1555. Paul IV, born Giovanni Pietro Caraffa, came of a distinguished Neapolitan family. Introduced at the papal court by his uncle Cardinal Oliviero Caraffa, he distinguished himself by his ascetic spirit amidst all the splendors of the pontificate of Leo X. In 1524 he obtained permission from Clement VII to join the congregation of the Theatines, founded by Gactan. He was made cardinal by Paul III in 1536 and charged with the task of restoring vigorously both orthodoxy and morals. Thoroughly impregnated with mediaeval culture, Cardinal Caraffa was hostile to the humanist tendencies of the cardinals Contarini, Pole and Morone. Nevertheless, his reputation for intransigence did not prevent his election to the papacy in 1555. On account of the wars with Spain he could not carry over to Rome the Council of Trent, which had been suspended since 1552; but he did establish cardinals' com-

missions to advise in the reform of the church. He was active in combating simony, in assuring the choice of able bishops and in compelling the monks who lived outside their monasteries to return to the life of the community. He enlarged the jurisdiction of the tribunal of the Inquisition and published the first Index of books condemned by it. The affection of the old pope for his worthless nephew, Carlo Caraffa, whom he first made a cardinal and then was forced to remove from office and to expel from Rome, was regarded as a regrettable weakness. In general his papal court, so severe in character that it was said that "Rome had become a veritable monastery of Saint Francis," left a lasting impress on the Catholic Counter-Reformation.

PAULSEN, FRIEDRICH (1846-1908), German philosopher. Paulsen was the son of a peasant in Langenhorn, Schleswig. He was educated at the universities of Erlangen, Bonn and Berlin and began teaching philosophy at Berlin in 1875. In 1894 he was appointed full professor of philosophy and education and held that post until his death. Philosophically Paulsen was the exponent of metaphysical panpsychism, which reflected the diverse influences of Spinoza's psychophysical parallelism, Schopenhauer's voluntarism and Kant's critical idealism. His *Einleitung in die Philosophie* (Berlin 1892, 42nd ed. 1929; tr. from 3rd ed. by Frank Thilly, New York 1895) was for decades one of the most widely read philosophical works in Germany. Of greater sociological importance, however, is his fruitful work in educational fields. His *Geschichte des gelehrten Unterrichts* (Leipzig 1885; 3rd ed. by R. Lehmann, 2 vols., 1919-21) is remarkable for its strong emphasis on the social factors in the history of education, despite the fact that at that time the whole field of sociology was very little known in Germany. The leading idea behind the work is that the exclusive dominance of the culture of antiquity in the educational life of modern peoples must be

broken down and that there should therefore be established, side by side with the classical *Gymnasium* teaching Greek and Latin, a modern *Gymnasium* (*Realgymnasium*) teaching modern studies, although retaining Latin. Paulsen's third important work, the *System der Ethik* (Berlin 1889, 12th ed., 2 vols., Stuttgart 1921; tr. from 4th ed. by Frank Thilly, New York 1899), is in its theoretical part quite close to Aristotelian energeticism (a doctrine of perfectibility with a biological emphasis). The applied part deals in detail with concrete moral relations in the German bourgeois world of his day and thus gives an intimate picture of the problems which perplexed that culture period. In his personal beliefs Paulsen was the advocate of a monarchical regime organized above party lines on a conservative-democratic basis; he opposed both a ruling parliament and a government responsible to a parliament. Although he rejected the revolutionary economic theory propounded by Marxism, he believed none the less in a gradual transformation which would tend increasingly toward the social organization of production under collective ownership and the limitation of private property in the means of production. He was thus not very far from the type of socialist attitude represented at that time by F. Naumann.

Paulsen's pedagogical theory (see his *Pädagogik*, ed. posthumously by W. Kabit, Stuttgart 1911, 7th ed. 1921) stresses, in accordance with his philosophical outlook, the education of the will over the education of the intelligence. For over twenty years he exercised a dominant influence on the character of Prussian education, particularly through his participation in the School Conference of 1890 and his many articles touching on every aspect of German education. After 1890 he championed the idea of equalizing the three forms of secondary schools (*Gymnasium*, *Realgymnasium* and *Oberrealschule*), which was effected in 1900. The upper ranks of the teaching profession received a marked imprint from his doctrines. Paulsen's work *Die deutschen Universitäten und das Universitätsstudium* (Berlin 1902; tr. by Frank Thilly and W. W. Elwang, New York 1906) and his small monograph *Das deutsche Bildungswesen in seiner geschichtlichen Entwicklung* (Leipsic 1906, 6th ed. by W. Flitner, 1929; tr. by T. Lorenz, London 1908) form an invaluable guide to the foreigner who wishes to study German education.

In his later years Paulsen, from his standpoint

of orthodox Christian faith, was disturbed by the developments of modern life, in which he saw the coming of a godless world and a humanity free from fear. As a writer he exercised through his fruitful criticism a great and many sided influence on his day.

PAULUS, JULIUS (c. 200 A.D.), Roman jurist. Paul, with his contemporary Ulpian, stands out as the last important representative of classical jurisprudence. His origins are unknown. His career brought him to the imperial council and under Alexander Severus to the highest political office (*praefectus praetorio*). Nevertheless, he still had time and energy to engage in very extensive literary activity. His writings number more than eighty, comprising over three hundred *libri*; Paul thus surpassed all his predecessors in volume of production. His works range from commentaries and monographs to professional opinions and casuistical writings and taken together cover the whole field of public and private law. He made available what centuries had accumulated in material and had achieved in form and method: the typical finale of a great epoch. He was, however, no uninspired compiler but rather a highly individual thinker with a scientific approach. While he did not write as easily as did his rival Ulpian, his works are marked by greater profundity; and in his critical appreciation and mastery of tradition he attained independent and original results. Endowed with a keenly logical mind, he inclined toward theoretical formulation yet was saved from fanciful constructions by his sense of the practical. The reproaches formerly leveled against him on the ground that he was doctrinaire and obscure have for the most part been abandoned since it has been recognized that much of the writing attributed to him was the work of the epigoni who glossed and paraphrased his writings.

Together with the books of Ulpian, Paul's works constituted for the uncreative succeeding age the most accessible and copious reservoir of

the classical law. As early as the third century there was prepared from his writings an anthology of succinctly stated and recast rules which as the *Pauli sententiae* achieved an enormous circulation and, especially in the West, disseminated a knowledge of the whole of classical jurisprudence. The first codifications of the German kingdoms, particularly the influential law of the West Goths of 506 (*lex romana Visigothorum*), directly reproduced a part of the text of the *Sententiae* (meanwhile still further altered) as well as the accompanying *Interpretationes*. Although Ulpian took precedence in the East, Paul was one of the five jurists whose opinions were given the force of law by the Law of Citations of 426. When in 533 Justinian put together his Pandects from the writings of the classical jurists, he took about a sixth of the extracts from Paul. More than two thousand fragments have survived in this and in other ways, although they are not free from falsification. Thus it was in great part through the work of Paul that the Roman law survived through the Middle Ages and into modern times.

PAUPERISM. See POOR LAWS.

PAVLOV-SILVANSKY, NIKOLAY PAVLOVICH (1869-1908), Russian historian. After graduation from the University of St. Petersburg Pavlov-Silvansky was employed in the state archives attached to the Ministry of Foreign Affairs; he thus had access to materials which he utilized in illuminating studies of the reformers in the reign of Peter the Great and of the revolutionary movements which culminated in the insurrection of December, 1825. Shortly before his death he began to lecture at the Higher School for Women and the Polytechnicum in St. Petersburg.

Pavlov-Silvansky's chief accomplishment was his discovery that striking similarities existed between the political and agrarian organization

of appanage Russia and continental feudalism. Although he recognized differences in the trend of development, he found in northeastern Russia of the thirteenth to the sixteenth century a system of vassalage relationships centering about the seignior, in the creation of which the institutions of benefice, commendation and immunity had a vital part; even legal forms and usages as well as knightly mores were virtually identical with those of feudal Europe. His demonstration of this thesis, based in part upon documentary material not previously available, led him to reinterpret certain phenomena which had been considered peculiar to Russia: the role of communal self-government in the early period, the decline of the "free" peasantry to servile status and the relative importance of feudal as opposed to allodial tenure. His position represented a radical departure from the traditional view that Russian development was unique, and his work was attacked as an attempt to equate distinct social systems by exaggerating the similarities of particular features. Even sympathetic critics maintained that his approach was too legalistic and static and that a closer approximation to feudalism was to be found in southwestern Russia and Lithuania. Although his chief work remained unfinished at his death, Pavlov-Silvansky was the first to present a scholarly treatment of Russian feudalism, a problem which has continued to be of great interest to historiography.

PAWNBROKING is the business of lending money upon the security of household goods or personal effects pledged in the keeping of

the creditor. It is not to be confused with the lending on pledges of other types of movable property, such as merchandise or negotiable instruments, or with a business in which pledge lending is ancillary to other operations. The type of security characteristic of pawnbroking loans suggests that their proceeds would seldom be used in regular business financing. It is true that during the period of town economy and handicraft production, when credit organization was as yet undeveloped, small and medium size business was commonly financed through the pawnbroker; his function was to transform hoarded wealth, which then constituted a considerable portion of the community's material capital, into liquid funds. And for several centuries after the close of the Middle Ages certain types of small business, for which no specialized system of credit accommodation was provided, had frequent recourse to the pawnshop. Even at present the pushcart dealer, the peddler and the sweatshop manufacturer in metropolitan centers like New York are in many cases financed through pledging. The primary economic function of the pawnbroker, however, is to provide consumer loans to those unable or unwilling to borrow in other ways. His clientele includes therefore several distinct groups: persons of superior rank in temporary straits; the *jeunesse dorée* and the demimonde who have no other sources of credit but can offer pledges of high value; artisans, petty traders, those engaged in small service industries as well as occasional entrepreneurs on the higher rungs of the business ladder; and, finally, the great mass of the urban poor.

In the popular mind pawnbroking is commonly identified with usury. This association may have its roots in the mediaeval controversy as to the ethics of loans at interest, but more pertinent is the fact that pawnbroking has for long been the outstanding form of consumer lending, attacked by the purists as "unproductive," or economically irrational, and recognized by competent observers as open to abuse by both lender and borrower. As in other types of consumer credit, in pawnbroking the bargaining power of the two sides is obviously unequal; and the cost of the loan is high, much higher than is apparently justified by the rate for business credit. A part of this, however, is the normal incidence of the pawnbroker's business: he pays more for the funds disbursed than the bank, incurs expenses in connection with appraisal and safekeeping of the pledge

and, where he specializes mainly in small loans of short maturity, his overhead expense per dollar of outstanding loans is rather large. Moreover his power over the borrower is not as great as that of many other lending agencies; for the borrower owes the pawnshop nothing unless he wishes to retain the pledged article. In effect the borrower sells the pledge and retains an option to repurchase it on certain terms; as a seller, however, he is handicapped by his ignorance of the market value of the article or must trust the pawnbroker as his agent in disposing of the forfeited pledge.

It is a moot question whether pawnbroking as understood today was practised in the ancient world. There is no doubt that some forms of pledge lending were well established in all the major countries of antiquity which developed an urban civilization; nor is there much uncertainty about occasional lending on household or personal effects. Pledging was a recognized contract in both Greek and Roman law, which evolved toward greater simplicity and higher protection for the creditor. On the basis of available data it cannot be established, however, that pawnbroking in antiquity was carried on as a specialized business, nor can problems peculiar to it be traced so far back.

In the history of western civilization pawnbroking becomes clearly distinguishable for the first time in the later Middle Ages. During the economic revival which set in with the beginning of the crusades and extended over the following three centuries the mediaeval economy, poor in liquid capital, of necessity resorted to an extensive use of credit. Since the collection enforcement machinery was unsteady and inefficient, landed property was difficult to alienate and such forms of personal security as surety and hostage were of limited applicability, much of the credit employed was naturally based on the security of pledges. Specialization in the credit business was stimulated by such factors peculiar to the age as the presence of money changers, who could easily attract the money saving of the community and circulate it again in the form of loans; the unevenness of economic development, which permitted earlier separation of trade and finance in the Italian city republics and afforded the Italian financiers preferential standing in other parts of Europe; and the peculiar position of the Jews, who under the pressure of the church were forced to abandon agriculture and who turned increasingly to money lending as the establishment of

free handicrafts, which they were not allowed to practise, narrowed the opportunities for local trade. Pawnbroking as distinct from general pledge lending became identified first with Jewish credit operations; for, unlike the Italian financiers, the Jews disposed of comparatively small capital, a rapid growth of which was precluded by mob violence and periodical confiscatory levies. Although originally they dealt with the lesser feudal baronage and the city patriciate, in the thirteenth century the Jews were reduced to lending almost exclusively to the small urban borrower upon household and personal pledges. Jewish pawnbrokers were most numerous in German territories, but even there they competed with native money changers. Elsewhere, as in Flanders, where the Jews were rare, or in England, where they were exiled in 1290, their place was taken by smaller Italian firms and native merchants.

The conditions under which mediaeval pawnbroking was carried on varied considerably in place and time. One serious obstacle was the canonical prohibition of usury, ever more stringent after the Lateran Council of 1179, which was often aimed particularly at the small loan, although it did not apply specifically to Jewish lending. Nor was the attitude of the secular authority particularly encouraging; it vacillated at first between the complete outlawing of credit and the exploitation of the credit specialist as a source of revenue. Later, however, the stress of economic conditions forced a more tolerant attitude. Pawnbroking as well as other types of lending was authorized under special charters defining the lender's legal status and regulating his responsibility for the safety of the pledge, the conditions of its forfeiture and sometimes the ratio of the loan to the appraised value of the pledge. Certain objects to which there attached a suspicion of dishonest appropriation could not be pledged, among them various kinds of unfinished goods; that is, articles likely to be in the possession of craftsmen working to order or on a contract basis. Loans to servants and industrial homeworkers were sometimes limited to a set maximum, which may be interpreted as an attempt to prevent overborrowing by those who ostensibly needed no credit for business purposes. Earlier charters did not as a rule provide for interest maxima, but this practise became increasingly common beginning with the thirteenth century. The most frequent maximum was $43\frac{1}{3}$ percent (two pence in the pound per week), and $86\frac{2}{3}$ percent

was not unusual, while in the eastern territories and the Danubian provinces the rates tended to be even more exorbitant. A characteristic mediaeval provision was the permission to exact higher charges from non-resident borrowers.

Credit on such terms, although apparently regarded as better than none at all, was extremely burdensome. Attention therefore was soon directed to organizing the supply of credit so as to lower its cost and make it more amenable to public control. Beginning with the suggestion of the bishop of Mende about 1326 that magistrates make pledge loans at low interest to all those in need, proposals of this type recur in the literature of the period. Yet these projects were not easily realized. The only authentic fourteenth century instance of a low interest pawnshop under public auspices is that of the city of Salins in Franche-Comté; established in 1350, it prospered so greatly that it was able in 1383 to grant a single loan of 20,000 florins on the security of real property, an eloquent testimony to its departure from the purposes envisaged by its founders.

It was only in the second half of the fifteenth century that the decay of the handicraft economy and the ensuing impoverishment of the masses furnished the necessary driving force for the establishment of a considerable number of charitable pawnshops, the *montes pietatis*, in central and northern Italy. It is significant that the movement originated in a country where lending of all kinds was widespread and where secular law under the influence of Bartolus had been increasingly adopting the canonical view of interest. The advocates and practical promoters of these institutions were the Observant friars, the radical wing of the Franciscans. Outstanding among them was St. Bernardin of Feltre, who preached against Jewish usury and organized effective mass pressure for municipal grants and private contributions to the *montes*; in the years 1484-94 he succeeded in founding or expanding no fewer than 30 such establishments. The fundamental purpose was to collect a fund, adequate to satisfy the legitimate credit needs of the lower class artisans and dealers and the poor in general; thus it was not unusual for the *montes* to set a fairly low maximum for loans and to refuse advances for commercial speculation. To prevent the dissipation of the fund arrangements were made for its periodic replenishment through various church taxes and collections, a legacy tax, sale of indulgences and the like. Except for a short period, when

the Dominicans disputed the legitimacy of "religious usury," charges from 4 to 12 percent were imposed to cover running expenses. These were at least as low as interest on long term loans secured by rent charges and were assessed with some regard to the ability of the borrower to pay; many small loans indeed were free. Loans were made for a period of six to twelve months and forfeited pledges were sold at auction, any surplus being retained for the borrower. Supervision of the *montes* was in the hands of municipal officers or, in most cases, of a self-perpetuating board of four clerics and eight laymen, membership in which was honorary and compulsory. Although their organization was practically foolproof, the *montes* survived only at the cost of perpetual vigilance. They did not fully succeed in eliminating the private pawnbroker, nor could they relieve those who had no articles to pledge; and there were complaints of favoritism by officials as well as of undervaluation of pledges by appraisers. The period of their active spread extended for about fifty years after the establishment of the first *mons* in Perugia in 1462; while some important institutions were founded in the following century in Italy (Turin 1519, Rome 1539) and in papal territories in southern France (Avignon 1577), the later history of the *montes* was one of reorganization to eliminate losses and of expansion by accepting deposits at low interest and providing general business credit.

The Italian *montes*, although much admired throughout Europe, were not widely imitated, for conditions in other countries were generally quite different from those which obtained in Italy. Moreover the attitude toward loans at interest was changing radically in the sixteenth century. For some countries the change was brought about by the Reformation. In the Catholic states too the definitive decision of the Lateran Council in 1515 to allow the *montes* to make moderate charges and the subsequent papal sanction of interest paying deposits dispelled for practical purposes doubts as to the legitimacy of credit on a self-supporting basis. When the government of the Spanish Netherlands, after being balked in its attempt to reduce the interest charges of the Lombard lenders so as to save the impoverished and heavily indebted nobility from ruin, set up public lending institutions, there was no question of raising funds by charity drives. The plan devised by the government architect Wenceslaus Cobergher and adopted in the Netherlands in 1618 and

in the bishopric of Liège in 1620 called for the sale of perpetuities at 6 to 7 percent interest and annuities yielding 10 to 12 percent. The moneys so obtained were loaned on pledges at 10 to 15 percent; these rates were further reduced (in Liège to 5 percent) where successful expansion made this possible. A similar idea was incorporated in the municipal pawnshops established in Germany in the sixteenth, seventeenth and eighteenth centuries; they were financed through the city treasury, sale of annuities and acceptance of deposits; and in many instances they extended other forms of credit beside lending on pledges. More important than the Belgian or German institutions was the Paris *mont-de-piété* founded by letters patent in 1777 in order to combat widespread private lending in open disregard of the usury law. Although its initial capital was provided from the funds of the General Hospital, which was also to claim the entire profits resulting from its operation, the expansion of its business forced the Paris *mont-de-piété* in 1779 to borrow substantial sums from private sources; that is, to adopt in effect the financing methods of Cobergher. The volume of its business was very large practically from the start, for it charged only 10 percent per annum plus a fixed fee of $\frac{1}{2}$ percent for appraisal, while even respectable private lenders demanded 10 percent per month. By the end of the eighteenth century public pawnshops were operating in many European capitals: in Vienna the imperial pawn office organized in 1713 with funds donated by Charles vi; in Madrid a *mont-de-piété* founded by the royal chaplain, who solicited private contributions; in Copenhagen the Assistenthuis financed by the Royal Naval Hospital. Even in Russia experiments were begun in 1733 with loans by the mint on gold and silver plate, followed by pawn loans from the state mortgage banks established in 1754 and by the creation of separate pawn banks affiliated with foundling hospitals in St. Petersburg and Moscow in 1772.

Where pawn offices were sponsored by the government, private pawnbroking was as a rule outlawed and driven underground. Modern regulation of the private business began in England, the only European power which did not indulge in this form of public enterprise, although even here projects similar to the continental were quite popular. In 1707 a Charitable Corporation, with a capital which amounted eventually to £600,000, was actually chartered to lend money on pledges both to the poor

and to persons in better circumstances; before its dissolution in 1731 the Common Council of London charged it with accepting stolen goods and offering prospective bankrupts an easy means of cheating their creditors. By that time pawnbroking in London was a thriving business; it was estimated that in the middle of the eighteenth century there were about 250 large pawnshops and that the total volume of loans of both large and small shops amounted annually to £650,000. It was apparently a committee of the larger pawnbrokers which introduced a bill in 1745 intended to protect them from "divers Persons of ill Fame and Repute, who live in Garrets, Cellars, and other obscure Places, taking upon themselves the Names of Pawnbrokers," and whose alleged misconduct extended to the charging of as much as six pence on the pound per week (130 percent), the substitution of cheaper articles for those pledged and the sale of pledges within three or six months. The bill, which proposed licensing and authorization to charge 20 percent, a fifth of which was to go to hospitals and workhouses, anticipated actual developments by only a few years. Pawnbroking was made an exception to the general maximum interest law in 1756, a maximum for all charges on pawn loans not exceeding £10 was set in 1784, and licensing was introduced in 1785. The situation was much clarified by the comprehensive act of 1800 which specified maximum charges (20 percent for loans £2 and less, 15 percent for loans 42 shillings to £10; plus a ticket charge of a half-penny to four pence for loans of 5 shillings and over, roughly proportioned to amount of loan), fixed the form of contract between pawnbroker and pledger as well as the form of the register to be kept by the lender, regulated the conditions of forfeiture (one year) and of disposal of forfeited pledges and provided for an Excise license, which did little more than impose a flat annual tax upon each establishment. Although not affected by this law, the business in Ireland had already been regulated by the acts of 1786 and 1788, similar to the British except that they allowed higher charges (25 to 30 percent) and required bonds and sureties.

The significance of this legislation and of the important Prussian act of 1787, which authorized private pawnbroking under the strict license supervision of local authorities but at rates exceeding the limits set by the general usury laws, lay in the recognition of pawnbroking as primarily a small loan agency subject to special

conditions. Even with the disappearance of the usury laws, abolished in the middle of the nineteenth century in all important European countries, this attitude was not fundamentally modified; for already it reflected the vital change in the economic nature of pawnbroking which began in the eighteenth and continued through the nineteenth century—its transformation from a source of regular if small business credit and of financial aid to the sinking nobility into an agency of small and chiefly consumption loans to the poor. The new clientele of the pawnbroker consisted in the main of workers in factory towns and commercial centers who lived on the bare margin of subsistence, whose employment was subject to the vagaries of the season and the business cycle and whose financial balance was easily upset by an extraordinary expenditure, especially in connection with sickness or death in the family. Even when trade union organization and social legislation succeeded in raising somewhat the standard of living of the masses, when the activity of friendly societies and cooperative associations assured a greater degree of financial independence for the majority, there still remained a large group living on the ragged edge, which after the middle of the century was augmented by a growing contingent of those employed in the sweated industries. And while business as a whole was provided with credit facilities much superior to those of the pawnbroker, he retained the allegiance of the small producers in those branches of manufacture in which old handicraft methods could still be followed, although at a great sacrifice. He was also a friend in need for those who were tempted to risk their small savings on the new opportunities for the self-employed mechanic and distributor which changing industrial and business technique seemed always to provide. Thus the pawnshop attracted a numerous class of regular clients borrowing from one pay day to the next, replenishing their cash holdings after holidays, pawning their winter clothes in the spring to redeem them in the fall; and the pawnbroking business became subject to marked periodic fluctuations, with loans more frequent at the beginning of the week, of the month and of the quarter, after holidays and in years of general prosperity, when business loans increased.

That the pawnbroker thus became predominantly "the poor man's banker" was obvious in every country, irrespectively of the system of regulation in use. As early as 1806 Patrick

Colquhoun observed that pawning was habitual with the poor of England's large cities and that "if these modes of raising money were not accessible or were suddenly taken away thousands would unavoidably perish in the streets" (*A Treatise on Indigence*, London, p. 237). With an inconsistency characteristic of a middle class reformer he attributed the situation to "improvidence and the total want of frugal habits or forethought"—a comment which can be matched only by the report in 1818 of the New York Society for the Prevention of Pauperism which listed pawnbroking as a cause of poverty along with ignorance, idleness, intemperance, want of economy, imprudent and hasty marriages, lotteries, houses of ill fame and, last but not least, numerous charitable institutions. According to official returns the average loan of licensed pawnshops was below 3 shillings for Ireland in 1864, about 3 shillings for Glasgow in 1840 and slightly over 4 shillings for Liverpool in 1869; these figures acquire added significance in view of the fact that, according to an estimate of 1871, there was one pawnshop for 6000 inhabitants in London, for 2200 in Liverpool and for 1400 in Manchester. In the Belgian pawn offices, which enjoyed a monopoly of the business, the average value of pledges at the middle of the seventeenth century varied from 10 to 33 francs (pre-war French unit), but two hundred years later the range was from 3 to 7½ francs. The average loan of the Augsburg Leih-Amt, dating from the late sixteenth century, was about 23 marks in 1747, less than 9 marks in 1812-13, 6½ marks in 1852-53, and less than 5 marks in 1893. The average loan of the Paris *mont-de-piété* was 37.7 livres in 1778-93 and 17½ francs in 1831-53. For the latter period the occupational distribution of its clientele shows 73 percent wageworkers and 4 percent employees; in 1886 the same groups constituted respectively 56.5 percent and 15.7 percent of all borrowers. Even the Berlin Leih-Amt, established in 1834 by the king of Prussia and generally recognized as primarily a middle class institution, included among its borrowers in 1890-93 13 percent workers and 54 percent artisans and tradesmen.

The reorientation of pawnbroking involved certain structural changes. In countries where private pawnbroking prevailed shops which catered to the wealthy were differentiated from those which did a regular weekly trade with the poor; the former specialized almost exclusively in pledges of jewelry and plate and were

as a rule attached to jewelry stores, while the latter were neighborhood establishments receiving clothes and bedding, musical instruments and mechanics' tools, clocks and small jewelry and a miscellaneous assortment of pots and pans and "bundle goods." There was in fact a third group of shops making loans so small that they could not possibly operate under rates set by the law; this they evaded by employing a contract of sale accompanied by a verbal promise to allow the seller to repurchase at a higher price within a limited time (rarely over a month). Curiously enough the same differentiation of pawnbroking into three classes according to the size of the loan, the charges and the maximum maturity applies even to a country like China, where pledge lending has existed for many centuries and no doubt still serves as a very important form of credit. The law eventually gave explicit recognition to the facts. In 1856 an attempt was made in the United Kingdom to bring "dolly shops" and "wee pawns" within the scope of the pawnbroking statute, whose requirements were somewhat relaxed for their benefit, allowing a halfpenny ticket charge also for loans under 5 shillings (Halfpenny Act of 1860); and the codificatory act of 1872 raised interest for loans not exceeding £2 to 25 percent, virtually exempted loans above that amount from interest limitation by allowing "special contracts" and provided for a certificate of character from a local magistrate as a condition preliminary to the granting of an excise license. In Germany, where the act of the North German Confederation in 1869 made the license requirements considerably less stringent than they were under the Prussian laws and left interest regulation to individual states, the laws of 1876 and 1879 assimilated *Rückkaufgeschäfte* to pawnbroking and provided in effect for certificates of character as well as of necessity.

Where the private business was handicapped by the competition of official pawnshops, a condition of its survival was a better adaptation to the needs of the poor: private establishments were located in working class neighborhoods, were accessible at more convenient hours, were more liberal in granting loans and less inquisitive as to the identity of the pledger; if their rates appeared to be higher than those of public pawnshops, this made little difference to those who pledged for a week or even a fortnight, for the public agencies generally enforced a minimum charge calculated on a for-

nightly or monthly maturity basis. Public pawnshops did of course take some steps to put their facilities at the ready disposal of the poor—they opened branch offices, engaged agents operating under the control of the central office and in Holland went so far as to set up special institutions for very small loans of short maturity in which red tape was virtually eliminated. Generally, however, the use of agents proved a makeshift which was not very satisfactory: they were allowed to charge a commission in addition to the regular fee, which raised considerably the total cost to borrower; they were not permitted to appraise pledges more liberally than the central office, nor to keep the pledges in their possession for any length of time so that redemption became rather cumbersome. Although the excesses of private pawnbroking were curbed, the practise was not entirely eliminated except in the smaller towns; this holds true even of countries, like France and Belgium, in which the public offices ostensibly enjoy monopolistic status, since lending on pawn tickets is still possible even if not strictly legal. For the extremely low valuation put upon pledges is the major grievance against the public pawnshop, an evil difficult to eradicate where, as in most instances, the appraisers are held personally responsible for losses incurred in selling forfeited pledges. Much more than the private shop, the public office therefore attracted the substantial pledges; in fact it could not otherwise enforce low charges and continue on a self-supporting basis, since the smaller loans of short maturity involved losses even where the funds were obtained at low cost by borrowing in the money market or accepting savings deposits. In some countries, as in France, the pawn offices were deliberately utilized as an agency of credit for other classes besides the poor. From the establishment of the public monopoly in 1805 there was a movement to emancipate the *monts-de-piété* from the onus of charity and subordination to the welfare administration. This was achieved in part in 1851, when these institutions were put under the supervision of municipal councils, which were also authorized to initiate the establishment of new *monts* subject to the approval of the central government; in the same year they were allowed to lend on new merchandise and to sell pledges, if so requested by borrower, after three months; in the twentieth century many of them were renamed *caisses du crédit municipal*. In 1891 the Paris institution was

authorized to accept in pawn high grade securities and after the war automobiles. In other countries too the public pawn office was drawn upon heavily by the middle classes in periods of severe economic dislocation, such as the post-war decade of inflation and deflation.

Because of the peculiarities of its political evolution the United States had no place for governmental or municipal pawnshops; instead there developed semiphilanthropic remedial loan societies founded by charitable organizations or public spirited citizens. The first pawnshop of this type was the Pawners' Bank of Boston (later renamed the Collateral Loan Company), which was granted a charter by the Massachusetts legislature in 1859. With a capital assembled by private subscription among the wealthy, on the promise of dividends not to exceed 8 percent, it began by making pledge loans redeemable within a year at 1 percent per month, a rate which it was later forced to raise, the maximum at one time being as high as 3 percent monthly on loans below \$50. At first it proved a disappointment to the founders, for its volume of business was small and it did not succeed in driving the private pawnbrokers out of business; it was only after 1873 that its operations began to expand and its average loan to decline. The largest of the limited dividend pawnshops is the Provident Loan Society of New York, established on the initiative of the Charity Organization Society by a group of wealthy bankers in 1894. It began with a modest capital of \$100,000, but its subsequent expansion, financed largely by accumulated earnings, was truly phenomenal. In 1929, when the volume of loans reached a high peak, its numerous branches throughout the city lent about \$44,000,000 on nearly 500,000 pledges; while the average loan was high, 53 percent of the total loans were below \$50 and 20 percent below \$15. Its loan charge of 12 percent is computed on a daily basis, although a minimum charge of $\frac{1}{2}$ percent is enforced. Despite its demonstrated success and its recognized leadership in the National Federation of Remedial Loan Associations, the example of the New York society has not been widely followed; other remedials lend for the most part on chattel mortgages, and even these have declined since their philanthropic promoters have turned their efforts toward fostering adequate state regulation of private loan offices.

Except in a few cities therefore the remedial pawnshop offers no serious competition to pri-

vate pawnbroking. The inception of this business in the United States probably antedates the nineteenth century, for it received legislative recognition as early as 1803, when the New York legislature passed an act (amended in 1813) authorizing the city to license pawnshops. Public attention was first focused upon them in the years following 1815, when the country experienced a period of acute economic distress caused by a flood of British imports. In 1817 the Pennsylvania Society for the Promotion of Public Economy asserted that the great number of pawnbrokers in Philadelphia was "a most serious and growing evil," because they were instrumental in reducing many persons to want, apparently by allowing extremely low valuations on pledges and charging as much as 5 to 18 percent per month; many of these were old clothes stores lending on the "repurchase" plan. While in 1819 the New York Society for the Prevention of Pauperism found only 10 licensed pawnbrokers in the city, who kept within the law as long as they did not exceed the charge of 25 percent for loans below \$25, ten years later the annual number of pledges and secondhand sales for the city was reported as over 150,000, with loans amounting to \$500,000. Pawnbroking developed more rapidly with increasing urbanization in the following century. Thus in 1859 the Boston Society for the Prevention of Pauperism found over 50 pawnshops, "most of them favorably located and exhibiting indications of thrift," but the facilities they furnished the needy were adjudged unworthy of the age and the community. A survey of pawnbroking at the end of the century showed that shops were established in many large cities scattered from coast to coast; there was considerable variation in the type of business, the average loan ranging from \$2.40 in Boston to \$7.92 in Washington, D. C., as well as in the terms on which it was transacted.

That such differences exist is not surprising since no national regulation was ever attempted. Regulatory power has been vested in the states, which in most cases delegate it to municipal or county authorities. A review of pawnbroking statutes undertaken by the Russell Sage Foundation after the war shows that there was state wide supervision in only six instances; two thirds of the states, however, exempted pawnbroking from the usury laws, permitting charges on a sliding scale, which raised some rates to 10 percent a month, or on a pro rata basis, from 1 to 5 percent monthly.

Local authorities have been concerned primarily with such questions as licensing, bonding and the form of record keeping; in large cities frequent reports to police on certain types of pledges are required. The foundation drafted also a uniform pawnbroking law, which provides for state licensing, bonding, annual examination and report, optional repayment in instalments, a 3 percent monthly charge on the outstanding balance, the expiration of at least a year before forfeiture and the sale of forfeits at public auction. The draft was approved by the National Federation of Provident Loan Associations in 1922 but has not been pushed vigorously since.

The total volume of pawnshop loans in the United States has recently been estimated at over \$500,000,000, which indicates that pawnbroking is still the largest of the legitimate consumer loan agencies. Competition from other lenders, such as chattel mortgage companies, salary loan concerns, industrial banks and credit unions, has, however, become increasingly severe. Except for credit unions these agencies are not at present as highly developed in Europe, but there is no reason to suppose that in the future pawnshops will not be equally handicapped in continental countries. For pawnbroking, which for several centuries held undisputed sway in the field of consumer lending, is not well adapted to modern conditions. The habit of hoarding is rapidly disappearing even among the poor; the surplus above current expenditure, if not deposited with a savings institution, is more likely to be invested in a radio set, an automobile, house furniture and fixtures than in articles which might conveniently be pledged. Where borrowing is repeated from week to week, a somewhat larger loan secured by a wage assignment and repayable in small weekly instalments might be preferable; the only advantage of pledging in such cases is that it is somewhat cheaper and involves less danger of abuse by both lender and borrower. The small business man too finds in many instances that it is more convenient to borrow on a chattel mortgage or an endorsed note than on the pledge of his wife's jewelry. Even though the occasional well to do borrowers and persons whose earning capacity is uncertain are as dependent upon the pawnshop as ever before, it is likely that pawnbroking may be entering upon a relative decline. And while there is still much room for improvement in pawnbroking practises, public attention has increasingly turned to other

small loan agencies, which stand for the present in much greater need of effective regulation and carry the promise of more extensive development in the future.

PEABODY, ELIZABETH PALMER (1804-94), American author and educator. As a family the Peabodys were closely identified with the literary, philosophical, educational and humanitarian movements which distinguished Boston at this period. One of the sisters married Nathaniel Hawthorne, another Horace Mann and the third, Elizabeth, gave her life to the establishment of the kindergarten in American education. She was admirably prepared for this service through her former experience as a leader in the Concord School of Philosophy and her interest in transcendentalism and the Brook

Farm experiment. When Mrs. Carl Schurz introduced her to Fröbel's *Die Menschengestaltung* (Keilhau 1826, tr. as *Education of Man*, New York 1885), she became an immediate convert to the philosophy of Fröbel and the kindergarten movement. Her friends urged her to devote herself to writing a book of literary reminiscences growing out of her experience in conducting a unique bookshop, which drew a wide circle of literary men and women, but she refused to comply with their request. Instead she threw herself into the movement for educational reform and in 1860 opened one of the pioneer kindergartens in America. Feeling that her comprehension of Fröbel's methods was inadequate she visited Germany in 1867, hoping to perfect herself in the knowledge and technique of teaching young children. While studying with trained leaders abroad she induced German kindergartners to come to America to carry forward the work during her absence. Upon her return she was largely responsible for the establishment of the first public kindergarten in Boston in 1870 and the founding of the *Kindergarten Messenger*, a monthly magazine which she edited for four years.

A prodigious reader, a tireless lecturer, a prolific writer, Miss Peabody gave herself with exhaustless enthusiasm to the dissemination of her convictions on all subjects, whether in a protest against slavery and American injustice to the Indians or for the protection and education of children, their mothers and teachers.

PEACE CONFERENCES. See TREATIES; WAR; WORLD WAR.

PEACE MOVEMENTS. Although organized peace societies did not develop until early in the nineteenth century, the aspirations and programs of these societies had found previous expression in religious and political literature. Utterances of the Hebrew prophets and the Sermon on the Mount had inspired the pacifist doctrine and behavior of religious sects. The Truce of God which grew out of the *Pax Dei* and was first put forward at the Synod of Elne in 1027 had prohibited all acts of private warfare for certain specified periods. In the fourteenth century Dante had proposed a world empire for ending war, and Pierre Dubois a permanent tribunal of arbitration. Projects such as the *Grand dessein* of Henry IV (1603), the *Nouveau cynée* of Émeric Crucé (1623), William Penn's *An Essay towards the Present and Future Peace of Europe* (1694) and Saint-Pierre's *Le projet pour rendre la paix perpétuelle* (3 vols., 1713-17), whatever their motivation, their feasibility and their ulterior political intent, were all schemes to establish international federations between certain independent sovereignties for the elimination of war. Grotius, Vattel and others had laid the foundations for international law codes; the *encyclopédistes* and physiocrats in France, the utilitarians and rationalists in England and the United States and Kant in Germany had voiced hopes for international peace. Internationalist sentiments had begun to influence not only statesmen but financiers; Necker, for example, inquired whether those who favored war had considered its injury to trade, the increase in the rate of interest through the multiplication of government loans and the burdens on industry resulting from higher taxation. Finally, the flourishing humanitarian trend gave the peace movement its psychological and institutional setting and its idealistic impulse.

The organized peace movement began in 1815 with the founding in the United States of three peace societies, the first in New York by David Low Dodge, followed independently by a Massachusetts society formed by Noah Worcester and one in Ohio by two Quakers. The tenets of Dodge's society are expressed in his pamphlet *War Inconsistent with the Religion of Jesus Christ* (New York 1812; ed. by E. D. Mead, Boston 1905), which opposed all wars, declaring that it was impossible to distinguish between offensive and defensive wars. Worcester's *A Solemn Review of the Custom of War* (Boston 1814, reprinted 1904), the first specifically to advocate joint action against war through

peace societies, urged a confederacy of nations with a high court of equity for the settlement of national controversies. In contrast to Dodge and the Quakers, Worcester merely denounced war in general terms and admitted the legality and justifiability of defensive wars, so that the former were only half hearted in their cooperation with him. In 1816 the British Society for the Promotion of Permanent and Universal Peace was founded in London; it was designed "to print and circulate tracts and to diffuse information showing that *War* is inconsistent with the spirit of Christianity and the true interests of mankind and to point out the means best calculated to maintain permanent and universal peace upon the basis of Christian principles." The society was extremely active; in the first year of its existence it distributed 32,000 tracts and its members delivered 4000 addresses throughout England. Under the influence of the American and British societies the Société des Amis de la Morale Chrétienne et de la Paix was founded in Paris in 1821 and in 1830 Count de Sellon formed the Société de la Paix de Genève.

In 1828 the local American societies were joined together by William Ladd, the most influential of the early American pacifists, into the American Peace Society on the broadest program of opposition to war not specifically condemning defensive wars. Because of the insistent pressure from peace workers who demanded an uncompromising stand, it revised its constitution in 1837 to express opposition to all wars, defensive as well as offensive. The issue remained a source of dissension and repeatedly threatened to disrupt the society. It was controversy over this matter which resulted in the formation of the radical New England Non-Resistance Society by Henry C. Wright and William Lloyd Garrison, which expressed opposition to participation in military service and declared unjustifiable any defense of property, liberty, life or religion. It led also to the founding in 1848 by Elihu Burritt of the League of Universal Brotherhood with branches in England, the United States, France and Holland; the members of the league pledged themselves individually "never to enlist or enter into any army or navy, or to yield any voluntary support or sanction to the preparation for or prosecution of any war, by whomsoever, or for whatsoever proposed, declared, or waged" and to employ all legitimate and moral means for the abolition of all wars. The American Peace Society sponsored Ladd's proposal for a congress of nations, and

through its agitation this plan was endorsed in 1837 and 1838 by both houses of the Massachusetts legislature, which recommended that the president of the United States open negotiations with foreign governments to this end. Although the London Peace Society reprinted Ladd's plan and petitioned Parliament in 1839 to take steps toward its establishment, British pacifists did not actively respond to the idea but confined themselves largely to the promulgation of the general principles and philosophy of pacifist agitation.

The American Peace Society expressed its opposition to current wars and when war was threatened urged arbitration; but under the conservative control of George C. Beckwith it carried out his conception of its function, which he declared was not to meet political emergencies involving war but merely to disseminate Christian principles which would obviate them. Encouraged by Charles Sumner's vigorous advocacy of peace in 1845, the society registered consistent opposition to the Mexican War; in Burritt's influential peace organ, *Christian Citizen*, men were urged to choose prison rather than service if they were drafted. During the Oregon dispute which threatened war between England and the United States in 1846 the "friendly address" movement, which was initiated by the peace address of the Birmingham pacifists to the "friends of peace" in the United States and popularized by Burritt through his fortnightly press circulars called *Olive Leaves*, reached wide proportions. Among the addresses was one from the National Association for Promoting the Political and Social Improvement of the People in England which urged the workers of the United States not to be "seduced" into a war to enrich the aristocracy, "our enemies and yours." The English pacifists passed many resolutions against the opium and Afghan wars and sought to discourage enlistments. In France, while organized pacifism, ignoring the masses, made apathetic efforts to convert kings to pacifism, French socialists, independently of the official peace movement, stressed the economic aspects of war and urged peace in the interests of the workers. Bastiat, Say and other French free traders along with Cobden, who was actively identified with the English peace movement after 1848, and Bright and Burritt as well pointed out the relation between restrictive tariffs and war. In 1850 Burritt urged working men "to unite and refuse to fight" and in his later pamphlet, *The World's Working-Men's*

Strike against War (New Britain 1855; reprinted in his *Ten-Minute Talks*, Boston 1873), he advocated "a parliament of the working-men of Christendom" and an "organized strike of the working-men of Christendom against war" as the only alternative to a congress of nations for "immediate, simultaneous, and propo tionate disarmament."

International peace congresses helped to direct public attention to the early peace movement. The first of these congresses, held at London in 1843 under the direction of the conservative elements in the peace movement, adopted resolutions seeking peace by effective propaganda against war and by the control of the manufacture and sale of munitions and advocated a congress and court of nations and arbitration clauses in international treaties. The international congress at Brussels in 1848 called by Burritt "to effect the entire abolishment of war" favored general and simultaneous reduction of armaments, arbitration, a congress of nations, international communication, postal reform, standard weights, measures and coinage and education toward the eradication of political and national prejudices. Prior to the next congress Cobden made his motion in the House of Commons urging that the British government enter into communication with foreign governments for the establishment of a system of arbitration throughout the world; although it met defeat, Cobden's speech served to arouse wide popular interest in the cause of peace. The Paris congress (1849), following upon the huge demonstrations in London, Manchester and Birmingham and the extensive world wide propaganda of Burritt and Henry Richard, secretary of the London Peace Society, marked the high point of the peace movement of this period; Great Britain alone sent 670 delegates, while the other countries were represented by 170. Victor Hugo in his inaugural address urged a United States of Europe; greater prominence was given to a discussion of the economic arguments against war than at Brussels and a resolution condemned loans and imposts for wars of aggression. After a vigorous peace campaign in the United States and Germany the congress of 1850 was held at Frankfort and was followed by the organization in Königsberg of the first peace society in Prussia, which was, however, soon suppressed by the government on the ground that it had unlawful correspondence with the London Peace Society. The congress refused to take official action when a delegate

from Schleswig-Holstein requested that a commission be appointed to inquire into its dispute with Denmark, but a committee from the congress did go in a voluntary capacity to urge arbitration. The last of this series of peace congresses was held in London during the Crystal Palace exhibition in 1851. Eleven countries were represented. In addition to the usual declarations an anti-imperialist note was introduced in a resolution declaring that nations making war on weak tribes should be designated "strong, but not civilized."

The popular passions aroused during preparation for the Crimean War then checked the growth of the peace movement. The London Peace Society sought to stem the tide; it urged resistance to military service, held protest meetings and sent petitions to Parliament criticizing war preparations. When war was declared, peace groups continued to function as an End-the-War League in the face of a hostile public opinion; the friends of peace were urged to refrain from any support of the war including even relief work, which was held to prolong the conflict. At the peace negotiations in Paris following the war the peace advocates, who urged a compulsory mediation and arbitration clause in the treaty, were instrumental in obtaining the inclusion of protocol 23, expressing the wish that nations before resorting to arms should have recourse to the good offices of a friendly power, which served as a precedent for later arbitration provisions. The work of the Peace Society then suffered a marked decline; its activities in the face of British wars in the Far East were negligible.

Peace work in the United States also waned after 1853. The American Peace Society had failed to expand into the south and west or to enlist new forces in the east. At first it evaded the impending Civil War by stating that its concern was only with international conflicts; when the war broke out the society declared it to be a rebellion against the Union which could not be countenanced by loyal citizens. The American Quakers, who had not actively supported the organized peace movement, refused to fight while William Lloyd Garrison held peace to be a secondary consideration when the abolition of slavery was involved. Protest against the support of the war by the American Peace Society led to the formation of the Universal Peace Union in Boston in 1866; in the same year the American Friends founded a peace association in Baltimore. The American Peace Society remained practically defunct until 1873, when

it began widespread propaganda for arbitration.

The second phase of the peace movement began in 1867 with arbitration and later a more systematic discussion of international law as its central aspects. During this period there was wider support among the masses, and the threat of a general strike, favored by the International Working Men's Association at its congress at Brussels in 1868, gained an important place in peace agitation. In 1867 Frédéric Passy founded the *Ligue de la Paix*, which in 1872 became the *Société Française des Amis de la Paix* and in 1883 part of the *Société Française de l'Arbitrage entre Nations*. In 1867 Ferdinand Santallier established a *Union de la Paix* at Le Havre. Charles Lemonnier sought to organize an international peace congress in Paris in the summer of that year but was refused permission by the French government. At a meeting in Geneva he then organized the *Ligue Internationale de la Paix et de la Liberté*, to which Passy and Richard refused to accord full support because it regarded as fundamental bases of permanent peace the world wide substitution of democracy for monarchy, the separation of church and state in all countries and the formation of a United States of Europe, while they wished to confine the agitation solely to an attack on war. In London William Randal Cremer founded in 1867 a branch of the league which cooperated closely with the branches of the Reform League. In 1870 he founded the Workmen's Peace Committee, which he enlarged in 1871 to become the Workmen's Peace Association. At the beginning of the Franco-Prussian War the International Working Men's Association appealed to international working class solidarity to stop the war; in a manifesto signed by Marx, Odger and others hostilities were denounced and attention was called to the fact that while the two national armies were fighting, the workmen of both countries were exchanging friendly addresses.

There was intensive agitation through press publicity, mass meetings and petitions for Richard's bill in the House of Commons in 1871 requesting that Great Britain take the initiative in the improvement of international law and the establishment of a permanent system of international arbitration. The parliamentary debate aroused greater interest than Cobden's similar attempt in 1849 and the bill was passed. If the early protagonists of peace revealed at times an unfounded optimism, the opponents of arbitration during this period sometimes displayed an

equally unfounded pessimism. A characteristic official opinion was that of Lord Salisbury, who ventured to prophesy that arbitration would "like competitive examinations and sewage irrigation . . . have its day and will pass away, and future ages will look with pity and contempt on those who could have believed in such an expedient for bridling the ferocity of human passions." He later modified his views, however, and his son, Lord Cecil of Chelwood, became one of the outstanding protagonists in Europe of arbitration, disarmament and the League of Nations.

Side by side with the movement for arbitration proceeded efforts for the improvement of international law. Two academic juridical societies were founded in Europe at the end of 1873, the *Institut de Droit International* at Ghent, devoted to the study of arbitration and private international law, and the *Association for the Reform and Codification of the Law of Nations*, known after 1895 as the *International Law Association*, formed at Brussels to promulgate a code. In 1877 at the Zurich meeting of the latter society Mancini and Bluntschli carried a resolution that in future all treaties should contain a clause making arbitration obligatory in certain classes of disputes. Sir Robert Phillimore, who was later to play so great a role in the shaping of the ideas which were to constitute the foundations of the Covenant of the League of Nations, was a member of this society. The year 1874 marked an important step in the creation of a real international administration in the formation of the postal union, whose members are pledged to submit to arbitration all disputes arising from its working.

With the aid of Auguste Desmoulins, Cremer organized the vast peace congress in Paris in 1878, with spokesmen from thirteen countries, which went on record for a court of arbitration and for an international commission to estimate the armaments of each nation; it demanded that a plebiscite be held before the annexation of any territory and urged liberty of conscience in all countries. Emphasis was placed on the costs to working men of wars and on the need for strike action to prevent war. The proposal that the peace societies in various countries be federated marked a step toward more effective organization. A conference of representatives from workmen's organizations from England, France and Italy to discuss peace proposals was held in Paris the following year, and upon his return Cremer carried a disarmament proposal through

the annual meeting of the British Trades Union Congress.

Peace societies were increasing in number and activity during this period. Van Eck established the Netherland Peace Society in 1870 and in 1874 Edward Lowenthal formed a peace committee in Berlin; in 1875 the latter advocated a universal parliamentary peace union, which was not realized until some years later. The first Italian peace society was established by E. T. Moneta in 1878. The Italian peace congress held at Milan the following year, attended by 4000 peace delegates from workmen's associations, passed resolutions in favor of arbitration and disarmament and asserted that the right to declare war was the exclusive prerogative of representative bodies elected by popular suffrage. The first Scandinavian peace society (the Dansk Fredsforeningen) was founded in Denmark in 1882. An anticonscription campaign in Belgium was led in 1881 by two pacifists. In 1880 Hodgson Pratt, maintaining that the London Peace Society would remain handicapped so long as its standpoint was primarily spiritual and Christian, formed the International Arbitration and Peace Association, which set up branches in nine European countries. A few years later Pratt emphasized the difference between pacifism and internationalism by declaring that his society was not a pacifist society at all, in that he stood for armaments adequate to insure justice from foreign governments. In 1887, however, when the campaign began for an Anglo-American arbitration treaty, the new and the older bodies and the American peace organizations worked together. A meeting in London between Cremor, Andrew Carnegie and Thomas Burt led to the drafting of a memorial to President Cleveland signed by 232 members of Parliament.

In the whole course of the history of the negotiations for Anglo-American arbitration there prevailed the same oscillation which has marked all efforts to establish a machinery of peace. There is general agreement of all parties concerning the desirability of settling differences other than by the old method of war and complete unanimity on the abstract desirability of arbitration; yet finally the reservations, in this instance inserted by the United States Senate, render the resultant treaty almost meaningless. The reservation of the first draft treaty was that "any difference which, in the judgment of either Power materially affects its honor or the integrity of its territory, shall not be referred to

arbitration under this treaty except by special agreement." But even so emasculated, in a form which committed neither party to anything, the Senate rejected it, bringing the work of the peace advocates to naught. In this decade also the American peace movement was prominent in the revival of the idea of Pan-American collaboration, first mooted in the abortive Pan-American Conference of 1847 (see PAN-MOVEMENTS).

During these crowded years of peace activity the entire peace movement of the world was being brought into closer touch with parliaments and governments and had increasing influence upon governmental policy. This development was facilitated by interparliamentary conferences on peace first held in 1889 and by the Inter-Parliamentary Union organized in 1892, composed of peace advocates in the parliaments of Europe and designed to discuss the most practical means of organizing world peace by simultaneous concerted agitation within parliaments of all countries. The Universal Peace Congress, held in 1889 on the initiative of Lemonnier and Pratt, at which organizations reflecting all currents of pacifist and internationalist thought were represented, went on record for compulsory arbitration clauses in treaties. These congresses were held annually thereafter. At the Berne congress in 1892 there was a sharp debate on the resolution for a "confederation of the European states," some delegates being apprehensive that the proposal postulated absorptions and annexations. There was disagreement also as to the resolution on sanctions, Darby, secretary of the British Peace Society, denouncing the approval of the use of force in holding governments to their pledges. The congress in Chicago in 1893 discussed a plan for an international court of arbitration drawn up by Philip Stanhope, which formed the basis of the official plan put forward at the Hague conference (*q.v.*) in 1899. The International Peace Bureau was established at Berne in 1892 as an international federation of peace organizations.

Each year saw some addition to the general power of the peace movements. Bertha von Suttner, whose peace novel *Die Waffen nieder* had a stupendous circulation, organized the Österreichische Friedensgesellschaft in 1891 and in 1892 Alfred Fried founded the Deutsche Friedensgesellschaft. The first Women's Peace League was established in 1895. The Nobel peace prize set up in 1897 stimulated wide

interest. The century closed with 425 peace organizations in existence throughout the world. But it closed also with the outbreak of the Boer War, the resurgence of an aggressive imperialism that shook the British peace societies, which had heretofore constituted the main element of the European peace movement. The French and American societies gained relatively in strength. Federation was attempted and in a measure achieved, although the peace society of Britain stood outside a formal federation, since it refused to work with bodies which in any way acquiesced in sanctions. An Anglo-French arbitration treaty was passed in 1903 and 162 arbitration treaties, which reserved questions involving "the vital interests, the independence, or the honour of the two contracting parties," were concluded during the next ten years. The organized peace movement in the United States grew in spite of the setback involved in the refusal of the United States Senate to consent to thirteen arbitration treaties negotiated by the Roosevelt administration. In 1910 Edwin Ginn established the World Peace Foundation with a large endowment and Andrew Carnegie founded the Carnegie Endowment for International Peace. In this year also was formed the World Alliance for Promoting International Friendship through the Churches, which had originated largely in the efforts of J. Allen Baker, a Canadian Quaker. In 1911 the National Peace Congress at Baltimore developed into the National Peace Council. In that year also President Taft gave an impetus to the whole peace sentiment of the country by declaring that matters of national honor should be referred to arbitration as much as those of property or national proprietorship; this prompted declarations in the same spirit in Great Britain. The Knox-Bryce Treaty, which provided that the types of question to be arbitrated should be specified and all others left to commissions of inquiry, which should also settle the question of whether the dispute was justiciable or not, was killed by the Senate on the ground that such a commission was an invasion of its own prerogative. In 1912 a new element was introduced into the peace movement by the creation of a British organization, the Garton Foundation, whose function it was to explore the commercial and sociological results of war, particularly the question of how far the modern banking and financial system had rendered illusory many of the old militarist assumptions concerning the benefits to be derived from conquest. With

Arthur Balfour, Lord Esher and Norman Angell as directors, the foundation was active, particularly among college students in Great Britain, Germany, France and the United States.

A resolution passed at the nineteenth Universal Peace Congress held at Geneva in 1912 declared that "Every pacifist ought to regard it as his sacred duty to oppose any war of conquest undertaken by the Government of his country" and must seek to demonstrate the injustice of such a war even "at the peril of his life." But such sentiments were dispelled quickly at the outbreak of the World War. The vast majority of members of peace societies soon succumbed to the patriotic propaganda of their respective governments and became ardent supporters of the war; the few who remained faithful to their peace principles were either jailed or otherwise repressed. Peace congresses ceased; the Inter-Parliamentary Union disintegrated; peace societies were completely disorganized; and only small isolated groups of peace advocates remained. The majority of the leaders of European parties of the Second (Socialist) International, which had resolved in the Stuttgart congress of 1907 to do all in their power to prevent war by means "which naturally vary according to the sharpness of the class struggle and the general political situation" and if the war broke out "to cooperate to bring it promptly to a close and to utilize with all their power the economic and political crisis created by the war to arouse the deepest strata of the people and to precipitate the downfall of capitalist domination," capitulated and endorsed actively the war activities of their governments. The small minority of anti-war socialists who met at Zimmerwald in 1915 pledged themselves to continue the struggle for peace and issued a statement urging workers to unite against war across frontiers and battle-fields.

The pre-war official peace movement had developed from an aspiration of religious mystics, based almost exclusively on the principle of the wickedness of all wars, into a movement favoring the creation of actual political machinery cooperating with the legal profession for the reform and administration of international law and had become respectable by the support given it by Andrew Carnegie, Nicholas Murray Butler and, finally, by the churches, even the state churches of the world. Although it is difficult to estimate the extent of their influence, the peace societies, through their work

in familiarizing the public with the idea of international cooperation, must in some measure have prepared the way for the League of Nations and the Kellogg Pact for the outlawry of war. Since the World War a large part of the work done by the pre-war peace societies has been pursued in Europe by the League of Nations societies established in each country. In Great Britain, for instance, the League of Nations Union, founded to carry on advocacy of the League of Nations, and which conducts an active campaign in favor of disarmament, is necessarily compelled to defend the ideal of peace. The membership of the union, which had about 3000 branches in 1933, was in the neighborhood of 1,000,000; the main effect of its missionary work has been to bring to the support of one aspect of the peace movement conservatively inclined people who before the war would almost certainly have declined membership in a peace organization.

The non-resistance movement has since the World War developed into the War Resisters' International, with affiliated societies in many countries, whose membership is drawn largely from middle class intellectuals. The British branch founded in 1921 as the No More War Movement is based upon an individual pledge not to participate in any future wars, comparable to the pledge taken by the members of Burritt's League of Universal Brotherhood in 1846. Pacifism has recently been manifested among students, as illustrated by the motion passed by the Students' Union of Oxford University and later by students of nearly every university in the British Isles that "this House will in no circumstances fight for King or Country." Peace sentiments of American students have been articulated by recent polls which have received wide publicity in the press. Groups of clergymen have likewise recently expressed themselves against war.

A development of the antiwar movements since the World War has resulted from the congress against war held at Amsterdam in 1932 which was called by Henri Barbusse and Romain Rolland, who invited the participation of all peace groups, workers' organizations and intellectuals opposed to war, regardless of political affiliations. Although conservative peace societies, certain pacifist groups and the leaders of the Second International refused to participate in the congress, charging that it was a "Communist manoeuvre," and although the organizers had difficulty in finding a city which would

permit its sessions, the congress nevertheless attracted more than 2100 delegates from twenty-seven countries, most of them representing workers' organizations. It went on record against imperialist wars, which were held to be an inevitable outgrowth of capitalism, and urged workers to organize to combat such wars. It was not pacifist in tone; it supported wars of colonial peoples and oppressed national minorities seeking independence. Committees were established to carry on the work after the congress, and public mass meetings and national congresses ensued. The intensive antiwar propaganda of the Third (Communist) International and of the trade unions affiliated with the Red International of Labor Unions has been linked up with efforts to prevent aggression against the Soviet Union and with the struggle against capitalism, the overthrow of which they regard as essential before permanent peace is possible

PEARSON, CHARLES HENRY (1830-94), English historian, educationalist and colonial statesman. Educated at Oxford, and for some time fellow of Oriel College, Pearson first held the chair of history at King's College, London, where he came under the influence of Frederic Denison Maurice; afterwards from 1867 to 1871 he was lecturer in modern history at Trinity College, Cambridge. His main historical works were a *History of England during the Early and Middle Ages* (down to the end of the reign of Edward I, 2 vols., London 1867), which is still a work of literary power and interest, although it has long been superseded in point of scholarship; and a volume of *Historical Maps of England during the First Thirteen Centuries* (London 1870), which did good service to students of history in its day.

Ill health forced him in 1871 to emigrate to Australia, where he became a power in the politics of the state of Victoria. He sat in the state parliament from 1878 to 1892, and from 1886 to 1890 he was minister of education. He had written a comprehensive report on public education in Victoria in 1878; and when he was minister he did a great deal to shape the educational system of the state, organizing both primary and secondary education, promoting the foundation of technical schools and anticipating generally many of the educational reforms which were to be achieved in England itself not until the twentieth century. Returning to London in 1892, he published his most famous work, *National Life and Character* (London 1893, 2nd ed. 1894), a survey, deeply influenced by his Australian experiences, of the growth of state socialism, the decay of the family, the waning of original genius and the menace arising from the growth of population in Asia and Africa.

ERNEST BARKER

PEASANTRY. The term peasantry has undergone many changes in meaning in the past and is still subject to various interpretations. Common to all the shifting meanings, however, is a view of the peasant as a tiller of the soil to whom the land which he and his family work offers both a home and a living. Peasant economy in this broad sense is already found in the earliest stages of history of all non-nomadic societies. In this period the peasant household is dependent almost solely upon the product of its own labor, a self-sufficiency which in some remote regions it has preserved to the present time. Its core is the family, whose size and structure have varied considerably in the course of the succeeding centuries. Some characteristic differences between peasant family types, such as those deriving ultimately from the matriarchal order, have finally become extinct. Others are still significant. Thus the large family, prevalent among Slavic peoples, unites in one household as many married couples as is economically feasible; while the small family, characteristic of the Germanic peoples, admits into the household only the mate of one of the children, generally that of the oldest son, who is to succeed to the management of its economic affairs. As is indicated by the origin of the word family (from the Oscan *famēl*, meaning servant), almost from the very outset the peasant economy drew occasionally upon the labor of persons who would not now be regarded as family members. In earlier periods these were prisoners of war or other unfree persons; later they were wageworkers, who were then customarily assimilated into the household.

While in many regions some independent peasant households survived through the centuries, the freedom of action of the peasant was early limited by territorial associations of a cooperative character; subsequently peasants fell under the rule of a landlord or other type of overlord. It is not yet clear whether and to what extent the earlier restrictions originated in the land commune. The theory, so generally accepted until recently, that agrarian communism involving periodic redistribution of farm land, as typified in the Russian mir, was an initial stage in the development of all peoples has been definitely disproved. The mir itself as well as a number of similar formations is clearly of rather recent origin; the type developed in German countries in the central period of the Middle Ages and in Russia in

the sixteenth and seventeenth centuries, partly under the influence of certain measures taken by landlords.

The appearance of manorial organization is universally of a later date than that of the peasant economy. In Rome it dominated the agrarian structure only after the Punic Wars and in the kingdoms of the Germanic tribes generally from the Carolingian period. Its introduction implied a social division of labor. An upper layer, living on the tribute paid by the peasantry, was liberated from agricultural labor or economic activity in general and released for political and military tasks; the peasants, on the other hand, whose services and dues furnished the economic base, were constituted into a clearly defined class with fixed obligations and privileges. The old division of labor was retained when contractual tenancy displaced serfdom. In many cases the new system grew out of an earlier tenure of the feudal type, as in northwest Germany in the late Middle Ages and in England shortly thereafter; the colonate of the late Roman villa had similar antecedents. Sometimes the transformation occurred, even while the general framework of the manorial system was retained. More often, however, the lease system arose independently of any pre-existing manorial relations. In the provinces of imperial Rome, in the old Asiatic states of China and Japan and in large portions of India land was cultivated as a rule not by the owner but by a tenant. In England the land lease with fixed money payments has become so common that the terms agriculturist and farmer (from *firmus*, which in the mediaeval Latin *firma* meant fixed payments) were considered interchangeable.

It would be unwise to generalize about the lot of the peasant under manorial rule, for it varied materially both geographically and in time. Where peasants voluntarily placed themselves in a position of dependence upon a lay or ecclesiastical lord in order to escape oppressive military obligations, their economic situation for the time being might have been even improved thereby. Again, the position of the peasant in the area of German settlement was distinctly bettered in the late Middle Ages as migration to the east became feasible. The services exacted from the peasantry must have been heaviest where the overlord managed his estate with a view to the commercial sale of its produce. Such was the situation in German

regions east of the Elbe beginning with the sixteenth century; here, with the development of the *Gutsherrschaft*, descendants of the German colonists, who once enjoyed a particularly favorable legal and economic status, fell into hereditary subjection with the result that their material situation became much worse than that of the peasants in older German territories. By recourse to Roman law concepts hereditary tenure with a moderate service burden was transformed into term leases; and after the Thirty Years' War the devastated peasant holdings were resettled under less favorable legal conditions than those which had previously obtained. A form of *Gutsherrschaft*, which drew heavily upon the labor power of the peasants and their teams, developed in the seventeenth century also in Poland and Russia; the serfdom of the peasants was here so complete that they could be sold separately from the land which they worked.

From the Carolingian epoch down to the eighteenth century the peasant populations in most European countries were personally unfree, economically hamstrung by heavy obligations and politically without influence; the peasant was represented neither in the English Parliament nor in estate assemblies of the continent. Peasant emancipation did away with the lack of personal freedom and reduced or abolished economic obligations and burdens; in most states also civil liberties and political rights were conceded in the course of the liberal political reforms of the nineteenth century, but increasing industrialization rendered them of little benefit to the peasantry. Emancipation, however, did not necessarily involve vesting the ownership of land in the peasant. It is curious to observe that, while the French Revolution stopped short of this, a tenure similar to ownership had been granted by the absolute monarchs of Prussia and Austria to peasants on crownlands; consequently almost half the land in the Romance countries—France, Italy and Spain—is still worked by tenants and share croppers. In many German states and in the Scandinavian kingdoms the peasant obtained hereditary use rights rather early and in the course of emancipation became almost universally the owner of land; as a result leaseholds cover only a quarter of all agricultural land in Sweden, an eighth in Germany and slightly over a twentieth in Denmark. The peasantry was completely dispossessed in England as well as in some regions of the Baltic sea-

coast (Mecklenburg, Holstein and Swedish Pomerania), where natural conditions favored the extension of the pasture and field grass system and where the distribution of political power prevented the territorial ruler from protecting the peasantry.

Emancipation of the serfs in Russia and Rumania, which was not carried through until after 1860, was intended to transfer some land to peasant ownership; yet, since the reforms were extended also to holdings of teamless peasants (excluded from its benefits in other countries, as in Prussia), the old system of labor exploitation founded upon semifeudal relations was maintained under newly evolved forms of combined tenancy and wage labor. A considerable portion of the peasantry was forced to rent land from neighboring estates in order to supplement its own insufficient holdings and to undertake in return onerous obligations including labor services; the mutual interdependence of peasant farming and large scale agricultural enterprise was thus continued under the new regime. Stolypin's agrarian reforms, inaugurated in 1906 in Russia, were designed to create an energetic and ambitious peasantry independent both of the landlord and of the village commune, but their execution was suspended at the outbreak of the World War. The agrarian revolutions of 1917-19 in eastern Europe were therefore carried out by the peasants themselves; the peasant's primitive fury was directed in the first place against the large estates, which seemed to him to block his own advancement. In this respect the uprisings were quite different from earlier revolts, such as the Peasants' War of 1524-25 in south and central Germany or the peasant movements in the early years of the French Revolution, which aimed primarily at reducing or abolishing the oppressive services and dues exacted by the landlords.

European peasant economy has not been entirely self-sufficient for some centuries. Where money payments to the lord of the manor or to some other overlord displaced payments in kind, money income had to be found through the sale of produce; by the late Middle Ages the peasant was already a frequent visitor to the city markets of central and western Europe. Production for the market has been of growing importance for the peasant particularly since the beginning of the eighteenth century. For the present studies of peasant budgets show that the value of market sales per unit of land area is at least as great for medium sized and family

farms as for large estates. Although the share of his own produce consumed by the peasant is still considerable, it is far from sufficient for his needs as a consumer, aside from his demand for productive equipment and supplies. Peasant economy has thus been forced into the mold of a business economy, but the peasant has not thereby become transformed into a typical capitalist entrepreneur. Peasant traditions have yielded at many points to the forces of the new age, and regions of old peasant culture have been impoverished by the competition of young countries overseas; yet by and large the peasant has held his ground. In areas close to markets he has displayed remarkable aptitude in accommodating himself to changing conditions; becoming an entrepreneur, he has nevertheless kept his old ties with family and soil. With this transformation have come changes in the connotation of the word "peasant." He is no longer a rustic of inferior status too ignorant and dull to take advantage of commercial opportunities; it is increasingly recognized that the really important characteristics peculiar to the peasant are his sentiments and attitudes, the intense attachment to his native soil and family tradition, which, even in the economic sphere, take precedence over the desire for individual advancement and gain. This peasant ethos is common throughout continental Europe. It is particularly strong in regions where homestead and agricultural lands appertaining thereto are transmitted undivided from generation to generation; this usage is widespread in Scandinavian countries, in the major portion of German speaking lands and among Poles and Czechs, who have for centuries lived in close contact with Germanic culture. Also in England and in oversea countries settled by English speaking peoples the farm unit is not generally disturbed by the passing of generations, although the individual farmer may have but a superficial attachment to his own soil. Lured by prospects of greater profit he is often willing to dispose of his old farm and move elsewhere; family ownership of the same homestead and farm through many generations, which is the rule on the continent, is a rare exception in areas of Anglo-Saxon culture. Again, it is the ethos of the peasant community which distinguishes the modern peasant from the farmer. The "American" notion that farmers are superior to peasants as production and business managers or as purchasers of industrial products lacks foundation in fact. That many peasant

groups, especially in eastern countries, live in poverty does not mean that peasantry and prosperity are incompatible. As the practise of Danish, Dutch and many German peasants shows, the peasant can employ modern production techniques, manage his business by principles of costing and plan in advance his marketing and financing.

The spiritual qualities of the peasantry have long been recognized and acclaimed by thinkers of an anticapitalist and antiliberal stripe. The Russian Slavophiles regarded the peasant as the living embodiment of the Slav *Volksgeist* antithetic to the liberal culture of the West, and the east European populists saw in peasant institutions survivals of an older communism and prototypes of a future collectivism. In the continental countries of western Europe measures to protect the peasantry from exploitation by the trader and the lender and even more far reaching programs to prevent the parceling of peasant holdings and complete proletarianization were pushed by conservative and social Catholic groups. In the period following the World War the newer conception of the peasantry was strongly emphasized in German National Socialism; it was given practical expression in the imperial law of September 29, 1933, which is intended to perpetuate the free peasantry as a valuable ethnic strain by protecting its land-holdings from the menace of burdensome indebtedness and parcellation.

Such protective measures and the honorific connotations which are being applied to the peasant calling are founded upon a belief in the outstanding importance of the peasantry from the point of view of national survival. Their sturdiness and fecundity; their ethos, which subordinates individual self-seeking to family and communal welfare; their reverence for tradition, which shields them from the extremes of intellectualism—these characteristic peasant qualities seem to offer special protection against the disintegration and degeneration which threaten as a result of excessive urbanization and industrialization. Recognition of the peculiar value of the peasantry does not necessarily imply an agrarian bias; it is freely accorded also by the leading elements of the non-agricultural population. An appreciation of the changing social role of the peasantry is apparent even among Social Democratic parties, many of which early in the post-war period modified the traditional Marxian position on this subject. While the Erfurt Program in 1891 character-

ized the peasantry as a declining middle class group, the Austrian Social Democratic program in 1925 stated that the peasant antedated feudal society, lived through feudalism, lives on under capitalism and will continue to live under socialism as the free holder of his land. Fundamentally the same attitude was expressed in the agrarian program of the German Social Democratic party adopted in Kiel in 1927.

The popular esteem which the peasantry is gaining even in such highly industrialized countries as Germany must be related also to recent economic trends, which discourage further industrialization. While industry offered employment at rising wages to an ever increasing number of people, migration into industry was highly attractive. Peasant youth could scarcely be kept on the land; and daughters preferred to marry teachers, petty officials and in many cases even industrial workers rather than to submit to the hard drudgery of a peasant housewife. With the decline of important branches of industry and the reduction of foreign trade to a minimum the situation has been radically altered; now even from a purely economic point of view farm life is preferable to the insecurity of industrial employment.

In the strongholds of European peasantry—the states formed in the western provinces of the former Russian Empire, the Danube basin and the Balkans—the peasants won a leading position after the World War when the great landed proprietors were compelled to surrender both their land and their dominant political status. Although in many instances the urban intelligentsia exercised a preponderant influence in the shaping of policies, the enormous weight of the peasant base was everywhere clearly discernible. The need for concerted defense of their achievements led the peasant parties to organize the International Agrarian Bureau in Prague in 1921; although it now includes parties of central and western Europe, it is still dominated by the east European group, a fact which suggests that mass interest in politics is not inherent in the peasantry but is the product of peculiar conditions in certain countries.

In Soviet Russia the peasantry came to the fore after the inauguration of the New Economic Policy. The Land Code of 1922 recognized the hereditary right of peasants to the use of the land which they cultivated by their own labor; the prohibition in principle of wage labor and of private land renting was peculiar to Russia,

although in a much weakened form it was an undercurrent also in the agrarian policies of other east European countries. Since 1928, however, the Soviet regime has, in its program of collectivization, pursued a policy frankly unfriendly to the peasantry as such; and the merciless persecution of the kulaks indicates that peasant aspirations and initiative will continue to be repressed. The peculiar energies and abilities indigenous to the peasantry have been denied free scope at a cost which cannot be offset by the few technical advances possible on large collective farms; as a result Russia, once by far the most important grain exporting country of the world, has in the past year or two experienced serious difficulties in feeding its own population.

The lessons afforded by the Soviet experience have contributed in great measure to the spread in other countries of an increased respect for the peasantry. And the distress caused by the extraordinary economic crisis which began in 1929 has revealed once more the value of a tenacious and productive peasantry as a guaranty against innumerable dangers. As a result there have been enacted certain radical measures for the protection of domestic agriculture, which in turn have multiplied the difficulties of the farmer overseas. The outcome of these developments is as yet impossible to foresee. Conceivably, the narrowing of economic opportunities in the new countries may create conditions favoring the development of a peasant psychology wherever agriculture is based upon the family farm. In any case neglect of or outright contempt for the peasant is a thing of the past. His economic, social and political importance has increased to a surprising extent and seems still to be on the upgrade.

Although the peasantry is an extremely important economic phenomenon (even in the twentieth century the bulk of agricultural produce throughout the world originates on peasant farms) no entirely satisfactory theory of peasant economy has as yet been devised. The theories current at present are for the most part a product of Russian scholarship based chiefly on statistical data for pre-war Russia. The most noteworthy is that expounded by Chayanov, who holds that the peasant economy is a family unit explicable in terms of the consumption requirements of its members rather than a capitalist enterprise bent upon profit making. This theory can scarcely claim validity for peasantry as a whole; and for Russia it has al-

ready been repudiated by Prokopovich. Its fundamental assumptions do not hold where the farm offspring emigrates into non-agrarian vocations, where outside wage labor is employed on the farm and where the peasant household is not of the Slavic large family type. It is true, however, that economic generalizations based on the assumption that human activity is motivated exclusively by economic considerations, and applicable to the capitalist enterprise do not altogether fit peasant conditions. Attempts at concrete analysis of peasant income into the accepted categories of general economic theory—wages, interest and rent—encounter insuperable difficulties; nor is the concept of profitableness applicable to the peasant's enterprise. Even within a single country such as Germany local differences—physiographic, economic, historical—make for a very considerable variation among peasant groups. The differences between German peasants on the one hand and Chinese or French or even Danish peasants on the other are of course still more glaring. Under such conditions it is difficult even to define the term, while the construction of a comprehensive theory of peasantry is well nigh impossible.

PECQUEUR, CONSTANTIN (1801-87), French economist, social philosopher and reformer. Forged in the environment of democratic and socialist agitation prevailing in France under the July Monarchy, Pecqueur's system constitutes an original synthesis of elements derived, according to his own statement, from such varied sources as Saint-Simonianism, Fourierism, French revolutionary ideology, particularly Rousseauism, and the Bible. A protagonist of collectivism, he rested his case not on grounds of abstract justice but on historical necessity. Although he never lost sight of the independent importance of ethical and religious ideas in historical development, the emphasis of his first important work, *Économie sociale: des intérêts du commerce, de l'industrie et de l'agriculture, et de la civilisation en général, sous l'influence des applications de la vapeur* (2 vols., Paris 1839), was upon the determining significance of economic conditions for all institutional relations and cultural systems. This thesis he elaborated with a completeness and wealth of historical illustration which have led modern commentators to regard the *Économie sociale* and his later *Des améliorations matérielles* (Paris 1839) as among the first expositions of historical materialism. His clarification of the concepts of class, class consciousness and class struggle, his interpretation of contemporary civilization as the reflection of bourgeois interests and his more technical analysis of the process of economic change and of the concentration of capital had an unmistakable influence upon the authors of the *Communist Manifesto*. His criticism of classical economic theory, with which he possessed a familiarity unique among the French socialists of the period, is also suggestive of Marx, although Pecqueur, unlike Marx, repudiated the whole framework of classical thought: his labor-time theory must be interpreted as an essentially ethical norm to be understood only in the context of the future collectivistic society.

The principles and organization of the collectivistic society are expounded in Pecqueur's *Théorie nouvelle d'économie sociale et politique* (Paris 1842). In this comprehensive synthesis the ethical and Christian elements of his thought

become unmistakably apparent; but while he borrows the phraseology of the Christian moral law to epitomize the collectivist principle, his actual description of the coming society is completely free from mysticism or abstraction. By collectivism he meant essentially state ownership and administration of all the instruments of production and the conversion of every citizen into an employee of the one national association. In his repudiation of the Saint-Simonian conception of the state as an aristocracy of genius and his insistence upon a democratic form of government Pecqueur betrays a vestigial devotion to libertarian ideology and a profound faith in the moral value of free will. Authoritarianism, even in the socialized state, he never accepted as more than a *pis aller* and in one essay, *De la république de Dieu* (Paris 1844), he tried to evade the dilemma by speculating as to the possibility of voluntary communistic associations.

As a practical reformer Pecqueur exerted little immediate influence. His collaboration with his most famous disciple, François Vidal, in the drafting of the report of the Luxembourg Commission during the Revolution of 1848 was an abortive experiment in the planning of co-operative production. An assiduous journalist, he shared in the popularization of socialist doctrines; but after 1848 he gradually receded into obscurity, for reasons among which must undoubtedly be included the moralistic tinge of his positive theory and the deep rooted aversion to violence which crops up everywhere in his writings, in his pacifism and sponsorship of a league of nations as well as in his treatment of the class struggle. As a theorist his influence upon better known writers is still not completely investigated, although it seems probable that his works provided leads not only for Marx and Engels but also for Louis Blanc in the formulation of his plan for state controlled workmen's associations and for Proudhon in the development of his philosophy of history. He was also a precursor of the idea of an upper chamber based on professional representation.

PEDRO I (1798-1834) and **PEDRO II** (1825-91), Brazilian emperors. Pedro I was the son of João VI, king of Portugal. In 1807 when the French were invading the country he fled with his father to Brazil, the status of which was changed from a colony to a kingdom, a part of the "United Kingdom of Portugal, Brazil and Algarves." In 1821 João returned to Portugal and Pedro became prince regent of Brazil. At that time secessionist influence was very strong and the animosity against Portugal was increased by the ill advised tactics of the Parliament at Lisbon, which demanded the prince's return and the reestablishment of the hated colonial regime. Pedro, disobeying the Cortes, placed himself at the head of the Brazilian revolution and in 1822 was proclaimed emperor of Brazil.

His reign was beset by many difficulties: the Portuguese garrisons offered resistance; there was a struggle for diplomatic recognition, although in this matter Brazil enjoyed Canning's effective aid; in addition there were internal dissension and outside wars. After his father's death in 1826 Pedro was acknowledged king of Portugal. But since the Brazilian constitution prohibited the union of the two crowns, he granted Portugal a constitution, abdicated the Portuguese throne in favor of his daughter Maria da Gloria and appointed his brother, Miguel, regent. The latter, however, declared himself king. A Brazilian revolutionary movement, which developed partly because of Pedro's Portuguese affiliations, led him to abdicate in 1831 in favor of his son, Pedro II. Pedro I went to Portugal, where he led the liberal forces to victory, thus assuring his daughter's throne and establishing a constitutional regime. In Brazil his name is linked indissolubly with national independence. João VI had prepared the way: he had opened Brazil to international commerce and established its principal economic, juridical, administrative and cultural institutions. Pedro gave independent Brazil a monarchical form of government and thus assured the unity of the country. His constitution of 1824 remained the fundamental law until the republic. Although essentially liberal,

it gave much power to the emperor and most of Pedro's reign was marked by absolutism in government, induced partly by party strife and partly by his desire to conciliate Portugal and to retain his personal connection with that country.

Brazil was governed by regents from 1831 to 1840, when Pedro II was declared of age and began that long period of rule which left such a definite imprint upon the national life of the country. From 1840 to 1849 factional revolts had to be suppressed, but for the next forty years there was almost no internal disturbance and Brazil made rapid technical and cultural progress. Over six thousand miles of railways were built and a telegraphic system was installed. Immigration was encouraged and foreign trade increased. Education was fostered and the arts and learning flourished. The reign of Pedro II was liberal like that of his father; he refused to have the Masons expelled from the religious orders and gradually abolished slavery. In 1850 the slave trade was prohibited; the Rio Branco act of 1871 declared that thereafter children born to slaves would be free; the law of 1885 held that slaves were to be freed on attaining sixty years of age; and finally in 1888 slavery was completely abolished. This liberal program, however, alienated the clergy and the slave owning landholders; they swelled the republican ranks and in 1889 Pedro was deposed.

PEEL, SIR ROBERT (1788-1850), British statesman. Entering the House of Commons in 1809 Peel was appointed almost immediately undersecretary for war and the colonies. As chief secretary for Ireland from 1812 to 1818 he continued to reveal unusual administrative ability and won new laurels by his attacks on O'Connell and the forces of disorder in Ireland. Returning to London, he served with distinction on a

parliamentary committee on the currency and received the major credit for the resumption of specie payments by the Bank of England. When in 1822 Peel took his seat in the cabinet as home secretary, he was known as a liberal Tory, dedicated to a policy of moderate reform. He established the London police force in its modern set up, sponsored 8 acts which made over the criminal code, repealed more than 250 archaic statutes and reorganized the judiciary. Upon the death of Canning he succeeded in bringing into one fold the Canningites and the anti-Canningites. As a reward he was made leader of the House of Commons when Wellington became prime minister in 1828.

Peel now made the first of his two historic reversals of policy by coming out in favor of Catholic emancipation. The Tory diehards found it difficult to condone this apostasy; but Peel, believing that it was a choice between emancipation and civil war, stanchly defended his change of front. After the passage of the First Reform Act, which he opposed, Peel served as head of the Tory party until the schism of 1846. During the first decade of the reform era he was in continuous opposition except for a few months in 1834 and 1835 when he was prime minister. Thanks to his growing prestige he was able to rebuild the Tory party on the ruins of 1832, and in 1841 he became prime minister with a comfortable majority. Confronted by serious financial problems, Peel led his party in the direction of free trade by lowering many customs duties and by abolishing others. He was persuaded by Cobden that the repeal of the corn laws was inevitable and he did not hesitate to reverse himself a second time on a major issue. Although the Tory diehards were up in arms once again, they were powerless to prevent Peel with Whig assistance from abolishing the corn laws. They were, however, able to deprive him of his command. The Tories split into two camps: the majority, following Disraeli, denounced their chief; the minority, among whom was Gladstone, rallied to his defense. Peel never recovered from the bitterness of the attack.

To many of his contemporaries Peel seemed the wonder of his age. Gladstone, to whom Peel was a mentor and a guide, regarded him as the most capable man he ever knew; Cobden, a political opponent, paid rare tribute to his memory; and Carlyle, believing that Sir Robert was destined by the Eternal to be England's coming hero, was rendered desolate by his death. In the larger perspective of history, however, Peel has

taken his place among the great opportunists. He was essentially a business man in politics and his major gifts were along administrative lines. Although he was a Tory, his political philosophy was impregnated with Benthamism and laissez faire doctrines.

PEERS, HOUSE OF. *See* LEGISLATIVE ASSEMBLIES.

PÉGUY, CHARLES (1873-1914), French publicist and nationalist. In 1897 Péguy became editor of a socialist library; three years later he founded the *Cahiers de la quinzaine*, a publication which he edited until his death. It presented to the public in addition to Péguy's own work the early writings of Romain Rolland, Jérôme and Jean Tharaud and Daniel Halévy as well as Jaurès' *Armée nouvelle* and carried on a strong pro-Dreyfus campaign. The *Cahiers* represented an entire epoch in the development of French intellectual life; it was the organ of all writers of left tendencies, whose only bond frequently was merely a discontent with the existing order; but especially it reflected Péguy's evolution toward an all inclusive nationalism. At first a socialist, he turned to Catholicism and then to nationalism, which became the enduring basis of his philosophy, combating any movement or idea which he thought might diminish the spiritual stature of France. He entered the army as a lieutenant on August 2, 1914, eager to fight Germany; on September 5 he was killed in battle. His enthusiasm for the war was but one aspect of his militant nationalism. This nationalism Péguy identified with the traditions of the people, their struggle and labor. He saw the flower of these traditions in Joan of Arc, a French peasant girl of his own blood and of whom he wrote often and movingly. He was never able to separate religion from the people, from France, and this was the basic cause of his difficulties with the Catholic church. He rejected the international church in favor of a French church; he was a true national Catholic and more than Maurras he merits pontifical condemna-

tion, for he wrote that "the French saints are the greatest of all saints." Indeed he felt closer to a non-Catholic Frenchman than to a non-French Catholic. Thus both his socialism and his Catholicism merged into a mystic nationalism, powerfully influenced by Bergson's philosophy of intuition, which had made a deep impression upon Péguy as a student. All social problems, all ideas, were given a national cast; international socialism and international Catholicism were both denied in favor of a transcendent national and class solidarity. In many respects Péguy anticipated the philosophy of fascism.

PELAGIĆ, VASA (1838-99), Serbian nationalist and socialist. Pelagić attended a theological seminary in Belgrade and later taught school in Brčko. Because of his nationalist activities, however, he was forced to flee and went to Russia, where he familiarized himself with current Russian socialist thought. In 1866 he returned to Bosnia and became head of a newly created theological seminary in Banjaluka, using his position to further the ideas of the Omladina, the Serbian youth movement. In 1872, having renounced his clerical vows, he proclaimed his allegiance to the socialist doctrines of Svetozar Marković. Later he was active in the preparation of the Bosnian insurrection of 1875. Although he suffered arrest and exile a number of times he never ceased agitating for his political, social and cultural ideals; and through his numerous newspaper articles and a host of books and pamphlets, most of which are now forgotten, he profoundly influenced his generation.

By temperament Pelagić was more of an agitator than a leader. He worked for the national liberation of the southern Slavs and was not satisfied merely with the ideal of a greater Serbia. In 1871 he began advocating a political and religious union of Serbs, Croats and Slovenes, not, however, in a centralized South Slav empire but rather in a federation of small autonomous

groups. Later he developed this ideal into a plan for a Balkan federation within the framework of a European confederation of states. His nationalism was from the start tinged with an awareness of social problems; the struggle against the Turks was a struggle for the emancipation of the peasants.

For a time Pelagić dominated socialist thought in Serbia. His socialism, however, was entirely emotional and utopian in character. He envisaged a future society consisting of small communities, each having from 40,000 to 60,000 inhabitants, who were to own communally the land upon which they were settled.

HERMANN WENDEL

Consult: Čubrilović, Vaso, in *Kalendar almanah prosveta* (Sarajevo 1925) p. 91-95; Lapčević, Dragiša, *Istorija socijalizma u Srbiji* (Belgrade 1922) p. 114-18; Wendel, Hermann, *Aus der Welt der Südslawen* (Berlin 1926) p. 203.

PELLOUTIER, FERNAND-LÉONCE-ÉMILE (1867-1901), French labor leader. Pelloutier, who was of bourgeois origin and received a Catholic education, entered radical journalism in 1885 as collaborator first on the *Démocratie de l'Ouest* and later on the *Ouest républicain*, the latter founded to support the Socialist candidacy of Aristide Briand. He joined the Guesdist *Parti ouvrier français*, but when as representative of the *bourses du travail* of Saint-Nazaire and Nantes in the Congress of Tours in 1892 he eloquently supported the general strike, he broke with this party and thereafter became a most vigorous opponent of parliamentary action. In 1893 he went to Paris and became secretary of the Fédération des Bourses du Travail, a post which he held until his death. In 1897 he founded the review *Les ouvriers des deux mondes* and was made investigator at the Office du Travail. He was dismissed from this post shortly before his death.

One of the founders and most able propagandists of revolutionary syndicalism in France, Pelloutier sought to embody in the *bourses du travail* those functions which would enable them to carry out the syndicalist program. The struggle of the workers must be waged on the economic plane through the autonomous grouping of the forces of the proletariat. The *bourses du travail*, uniting the trade syndicates in each city, must improve material conditions by fighting for reduced hours, increased pay and unemployment aid. They must go further, however, and by providing vocational training, teaching the workers organization and administration and

by concentrating all economic functions within themselves must prepare for the transition from capitalistic to collective ownership. The workers must be taught that the bourgeoisie will yield only under compulsion, must shun conciliation between the classes and must prepare themselves, through organization and the cultivation of their intelligence, for the general strike, which is tantamount to an attack, necessarily victorious, upon the existing order. In contrast to the socialists Pelloutier held that the program of political action involving the seizure of the state was worse than useless; the state must be destroyed.

Pelloutier was perhaps the ablest labor organizer of his time. Under his direction the federation became the largest and most powerful labor body in France, claiming over 200,000 workers. Its influence extended to the Confédération Générale du Travail, which was able to absorb the federation after Pelloutier's death by modifying its program and permitting a broad scope to the local *bourses du travail*. The doctrine of revolutionary syndicalism so ably set forth by Pelloutier remains deeply rooted in the labor movement of France.

PENAL COLONIES. *See* PENAL INSTITUTIONS; TRANSPORTATION OF CRIMINALS.

PENAL INSTITUTIONS are places where persons whose liberty has been curtailed by law are confined to assure the successful administration of justice or the application of penal treatment. Three epochs may be distinguished in their history. During the first, which lasted until the middle of the sixteenth century, penal institutions were chiefly dungeons or detention rooms in secure parts of castles or city towers, used to detain prisoners awaiting trial or execution of sentence. The second epoch was one of experimentation with imprisonment as a form of punishment for certain types of offenders, mostly for juveniles, "sturdy beggars," vagabonds and prostitutes. The London Bridewell,

the Amsterdam Rasphuis and Spinhuis, founded respectively in 1557, 1595 and 1597; Francis' Florentine Hospice, established about 1677; the reformatories for boys and women in St. Michael's Hospice in Rome, founded in 1704 and in 1735; and the Ghent workhouse, first established in 1775, were the most important of the institutions of this period. Most of the elements of penal administration, originating in these institutions, were brought into more or less general use toward the end of the eighteenth century, when the third epoch was inaugurated, that of universal adoption of imprisonment as a substitute for virtually all corporal or capital penalties. In contemporary society the prisons have replaced the scaffold, the stocks, the pillory and the whipping post as the most conspicuous if not the most commonly used instrument of penal treatment.

Penal institutions reflect in their construction and architecture the attitude of society toward prisoners. The demand for custodial security has been met generally by unscalable walls, stone or steel cells and complicated locking devices and is further symbolized in the fortresslike architecture of the buildings. The penal philosophy expressed in the construction of the Eastern Penitentiary of Philadelphia and the Auburn Prison of New York a century ago gave wide vogue to constant isolation in cells or to such isolation at night only. The hub and wheel spoke architecture of the former institution with its fairly large and light outside cells may be seen in a vast number of foreign prisons, while the Auburn interior cell block with its small and dark inside cells is a characteristic feature of the prisons of the United States. The strict isolation system still found in some of the prisons of Holland, Belgium, Scandinavia and France has been carried over into their prison schools, chapels and recreation grounds. The anachronistic panopticon prison with its circular cell houses and peripheral cells, sponsored by Jeremy Bentham as a means of facilitating direct and constant observation of prisoners and adopted in Holland and Switzerland a century ago, has recently been unsuccessfully revived in Cuba and in Illinois. Changes in theories of penal treatment have initiated revolutionary modifications in the architecture of prisons. Cottage construction has been used increasingly especially for juvenile training schools and for institutions for women and petty offenders. Many institutions for less serious offenders have never had cell construction but have utilized large dormi-

tory rooms for all but special classes of inmates. Contemporary authorities advocate penal institutions holding no more than 500 to 1000 prisoners. Yet prisons have been recently constructed in the United States and elsewhere to house as many as 6000 inmates.

From the point of view of the role they play in the process of judicial administration, four classes of institutions can be distinguished: those for temporary confinement of persons arrested; those for persons awaiting trial or execution of sentence; those in which sentences of penal treatment are liquidated; and those for the internment of socially dangerous offenders. Institutions of the first class (lockups, *dépôts de sûreté*, *carceri mandamentali*) are very small, usually consisting of a few cells in city police stations or rural jails. Their number is estimated at about 11,000 in the United States, of which there are 384 in New York state and 58 in New York City; France has 3585, Czechoslovakia 379, Italy 831 and Scotland 30. Institutions for prisoners held for trial (jails, *carceri circondariali*, *maisons d'arrêt*, *Gerichts-* or *Untersuchungsgefängnisse*), usually located conveniently to the courts, are less numerous. In many states they are used also to incarcerate short term prisoners and those whose fines have been converted to imprisonment. In the United States the estimated number is 3500; England and Wales have 31, Canada has 128, Finland 8, Sweden 197, France 160, Germany 134, Belgium 27, Austria 226, Italy 116 and Czechoslovakia 37. In many countries these institutions are built with cells, but in others they frequently lack proper segregation facilities. Large detention houses exist in metropolitan centers; the Naples prison has accommodations for 3280 inmates, the Berlin prison for 1460, the Paris Santé has 1042 cells and the New York Tombs accommodates 556 prisoners. Institutions for those undergoing penal treatment subsequent to conviction have gradually evolved out of local jails or workhouses with a heterogeneous population into highly complex and diversified penal systems. The nature of the crime is still the basis for the primary classification of these institutions into those receiving serious criminals on long sentences (state prisons, convict prisons, *Zuchthäuser*, *maisons centrales*, *case penali*); those receiving less serious criminals on moderate sentences (jails, houses of correction, *Gefängnisse*, *maisons de correction*); and those receiving petty offenders on sentences of a few days (police jails). The growing demand for individualized treatment of prisoners has

caused the first two types to split into administratively distinct units or to provide within their walls for the separation of groups of prisoners for special care. The bases for such further classifications have been found in factors like sex, race, age, the length of sentence, the character and conduct of the prisoner and the institution's labor program. Larger states have special institutions or sections of institutions for one or more but never for all of the following classes: military prisoners, civil prisoners, political prisoners, adult first offenders, adult incorrigibles, youthful first offenders, juveniles, the insane, vagabonds and beggars, mental defectives, drug addicts, inebriates, tuberculars, epileptics, chronic invalids and incurables, the aged and infirm and the best behaved prisoners. In the group of institutions for the internment of socially dangerous offenders may be placed institutions for the criminal insane and mental defective as well as certain European institutions for incorrigible recidivists, such as the one at Camp Hill, England. Most of these have developed during the last decade and are designed to carry out provisions of the measures of security which have been incorporated in recent European code revisions. Institutions may of course also be classified according to the type of construction (cellular, non-cellular, mixed) or according to the form of labor (industrial or farm prisons, road camps).

The magnitude of the task of penal institutions may be ascertained in part from the fact that in the United States in 1930 courts committed 66,013 prisoners to 104 state and federal adult prisons and reformatories which reported to the United States Bureau of the Census. It is estimated that about 2,700,000 persons are committed annually to lockups in the United States. In the fiscal year 1930-31, 144,231 persons were committed to penal institutions in New York state alone, of which 3790 were received by state institutions, 11,895 by county penitentiaries, 55,309 by county jails and 73,237 by institutions in New York City. In the same year Massachusetts state institutions received 3192 persons from the courts, while 32,269 were committed to county jails and houses of correction. The Canadian institutions in the same year recorded 75,591 new admissions, of which 63,672 entered county jails. England and Wales in 1930 committed a total of 59,936 persons to institutions, consisting of 7504 on remand or for trial not followed by imprisonment, 13,276 for civil debts, 12,497 in default of fine payments, 25,349

to serve mandatory sentences, 536 to penal servitude and 774 to Borstal detention. France in 1928 sent 139,305 persons to lockups, 142,856 to jails and workhouses, 1101 to public correctional schools, 3580 to central prisons and 447 to the deportation depot. Italian prisons in 1927 received 76,152 persons held at the disposition of the police, 152,569 at the disposition of the courts and 36,194 to serve sentences; in addition 1045 juveniles were admitted to correctional schools, making a total of 265,960 persons.

Penal institutions are heavy financial burdens to all states. Detention jails and institutions for women and children are particularly costly; but even institutions for men are rarely self-supporting, because of the improper or impracticable organization of prison industries or because the educational or correctional functions of these institutions preclude such organization. No adequate cost figures exist for the United States. The National Commission on Law Observance and Enforcement estimated in 1928 that the cost of maintaining state institutions alone amounted to \$51,000,000. Federal prisons and reformatories cost over \$4,500,000 in 1930-31. The net cost of operation of the state and county institutions of Massachusetts in 1931 was \$3,379,492, which figure does not include the cost of maintaining juvenile training schools. During the same year Canada expended \$1,873,040, the net cost of her dominion penitentiaries alone, and England spent £675,419 on all its penal institutions.

There is wide divergence among the various states with regard to the system of administration, control and supervision of penal institutions. In the United States there exist several federal and 48 state systems in addition to the local county and municipal systems. The office of the judge advocate general of the Navy Department administers navy prisons and receiving ships, stations and barracks; and the War Department has military prisons and military post prisons. The attorney general administers through a bureau a few civil penitentiaries, reformatories, detention houses and prison camps scattered from coast to coast. The penal institutions of Porto Rico and the Philippine Islands are administered by bureaus of prisons in the departments of justice of those dependencies; in Hawaii the administration of the territorial prison was in 1931 removed from the attorney general's office and placed under the authority of a board of prison directors, while other institutions are under local control. The Department

of the Interior is in charge of the prisons of the Virgin Islands. and the State Department, through its diplomatic representatives, administers certain consular prisons in a number of non-Christian countries.

In the United States the federal practise of administration through the Department of Justice is not followed by the states, where local jails, houses of correction or juvenile correctional schools are owned and administered by the county or municipal authorities; the state government possesses no powers of supervision or control over these local institutions in 16 states and supervisory but no compulsive power in 23. In the remaining states the central government has either secured complete administrative control of all local institutions, as in Rhode Island, or of some of them, as in North Carolina, or can establish mandatory regulations to govern some or all important features of their management. County institutions are administered either by the sheriff or by commissioners. The administration of municipal institutions presents a picture as diverse as that of the state institutions. State penal institutions are administered by prison boards of varied size and authority, usually appointed but occasionally elected, in some states unpaid and in others salaried. In a number of states the boards deal with penal institutions only; elsewhere the administration of all state penal, charitable and sometimes also educational and public welfare activities is brought under the jurisdiction of one administrative board. The boards usually appoint the executives and other employees and are virtually in complete control of the institution, although they are at times dependent upon some state agency or upon the approval of the chief executive in matters of rules and regulations, construction plans, sanitary arrangements and salary schedules. Sometimes penal institutions are administered by state departments, headed by directors or commissioners who are members of governors' cabinets. State juvenile correctional schools are frequently managed either by individual boards, by a special division of the central state board or by some state department, commission or board distinct from that administering institutions for adults. Private or quasi-public schools for juvenile delinquents, found in considerable numbers in the United States, are usually subjected to some form of inspection by local or state government departments. In some states the function of releasing prisoners on parole has been divorced from the prison adminis-

tration and placed in the hands of special agencies.

From an administrative point of view foreign penal systems are almost as varied as those of the United States, although a greater degree of centralization generally exists and the highest authority is usually the minister of justice. The situation in some federated states is in many respects similar to that in the United States. In Canada, for instance, the penitentiaries which receive all prisoners on sentences of over two years are administered by the dominion Department of Justice. Most jails and all juvenile correction schools are locally administered, however, while the provincial governments maintain industrial farms, administered through provincial departments, such as the department of public works, by the provincial secretary or by the attorney general. The federal Department of Justice of Mexico and that of Argentina administer the prisons of the federal capitals and territories, while the constituent states maintain their own penal systems. Germany and Switzerland possess no federal institutions; penal treatment in these countries is administered entirely by the constituent states or cantons.

In unitary states the degree of centralization also varies. England, for instance, through its prison commissioners, who are responsible to the secretary of state for home affairs, administers all penal institutions, including the local ones; but juvenile institutions are privately managed under the supervision of the Home Office. The secretary of state for prisons of Scotland administers all institutions except juvenile correctional schools, which are under the Education Department, as are those of the Irish Free State, where the minister of justice controls the adult institutions. Norway has centralized administration of all institutions through a directorate in the Ministry of Justice. Denmark has the same supreme authority, but local government agencies administer jails. In Sweden a director in chief appointed by the king administers all state institutions except workhouses, which are administered by the Department of Social Welfare, and a juvenile training school administered by the Department of Justice. Detention jails are locally owned and administered, but under rules made by the director in chief. In Finland, Italy and Japan a director in the Ministry of Justice has complete control over all institutions, while in Austria all but workhouses and juvenile institutions are under the Ministry of Justice. All the German states have centralized administration

through ministries of justice, except a few small states like Hamburg, for instance, where a member of the senate performs the task through a director. In Belgium different departments in the Ministry of Justice administer the institutions for adults and those for juveniles, while in Holland the juvenile schools and the institutions for adults are under different ministries. The French and Prussian systems are decentralized. In France the director of prison administration under the Department of Justice operates all institutions—except police jails, which are under local control—through subdirectors in each of the sixteen prison districts into which the country is divided. The prisons of the Seine and the juvenile institutions each have a director, however, immediately responsible to the director of prison administration. In Prussia thirteen district administrations, under the superior control of a state administration in the Ministry of Justice, administer all but police jails. In the Soviet Union the Commissariat of Justice, through a prison director, is in supreme charge of all institutions and operates through inspection departments attached to the administrative section of the People's Executive Committee in each of the provinces and territories. Each institution is supervised by a vigilance committee with the institution's director as chairman and the justice of the People's Court of the district and a representative of the trade union office as assessors. Many European states have made use of boards or committees, wholly or partly composed of private citizens, for either administrative, supervisory or advisory work. The French prison directorate has advisory councils for different phases of its work and each institution theoretically has a surveillance committee of private citizens, which rarely functions. In Holland all but one institution is administered by an unpaid Board of Regents, the directors of the institution, like the boards, being appointed by royal decree and other employees by the Ministry of Justice. Belgium has a large state advisory council for prisons and also decreasingly effective administrative boards which manage all but the fiscal affairs of their respective institutions, while fiscal control is centralized in the Ministry of Justice. Some German states, such as Prussia and Saxony, also have advisory boards; in Prussia these are chosen by municipal or county authorities.

The extent to which the judiciary has been used in Europe in the administration of prisons goes far beyond practise in the United States,

where, at the most, local jails are subject to inspection by judges of county or municipal courts or, in a few states, by boards of trustees of such institutions appointed by the judiciary. Provision is made by law that the membership of many of the European advisory boards should include judges or prosecutors. The visiting committees of justices in England have greater disciplinary powers than the prison wardens. In Austria committees of the judiciary supervise the work of the institutions. The judiciary in Saxony appoints not only the clerks but the guards, while in Italy, since 1931, a justice, known as the surveillance judge (*giudice di sorveglianza*), decides on all measures affecting the treatment of prisoners, including transfers, conditional releases, disciplinary punishments and promotions. In many states the law imposes upon the district courts the duty to supervise the work of the institutions in order to prevent illegal administrative methods.

The staff of a penal institution renders administrative, custodial and technical services. Numerically and functionally the staffs vary from the single keeper of the small jail to the large and complex personnel of the greatest prisons. The typical penal institution has a chief executive, guards, a clerk, a chaplain, a physician and perhaps an industrial supervisor. The disciplinary and custodial features of imprisonment have caused many foreign states to draw their executives and custodians from the ranks of the army. Medico-penal institutions are, however, usually administered by trained psychiatrists, while in the management of institutions for juveniles everywhere, and for women in the United States, teachers or social workers are being employed. Political considerations still play an important role in the appointment of the staffs of penal institutions in many states, while in others civil systems of selection and promotion by merit are common. The increasing emphasis on the correctional and educational functions of penal institutions has led to a demand, by no means universal, for training schools or courses for prison guards. Since 1791, when Wagnitz suggested such schools, many experiments in their use have been made; these have been encouraged by the endorsement of the international prison congresses. The best known schools have been those of Lüneburg (founded in 1859), Rome (1873), Paris (1893), Tokyo (1898) and Madrid (1903). Since the World War a large number of states have established schools with varying success, among them Eng-

land, Sweden, Finland, Peru, Prussia, Greece, Belgium and Poland. In the United States a lecture course to prison officers given in Massachusetts in 1921 was followed by the establishment of schools by the New York City Department of Correction in 1927, by the Federal Bureau of Prisons in 1930 and by the State of New Jersey in 1931. Only a few states, including Prussia and France, have schools for the higher administrative or custodial personnel; no such official training schools for superior officers exist in the United States. In several states university institutes and schools for social work now offer courses in correctional work.

It is in the composition and functions of the technical staff that the changing penal philosophy of recent decades has had its greatest influence. The United States Penitentiary at Atlanta, for instance, now has warden's assistants who are trained social workers, charged with aiding the prisoner in dealing with his family problems, and with the study and coordination of all the institution's efforts to individualize treatment; it has also a supervisor of education and two assistants, a staff of academic and vocational teachers, a trained librarian, medical officers, dental officers, a psychiatrist, a psychologist, a pharmacist, women nurses and a number of part time medical consultants. While psychiatrists have become important members of the staffs of penal institutions in many states of the United States and in certain European countries, such as England, Belgium, Bavaria and the Soviet Union, psychologists are rarely found in correctional administration outside of the United States and the Soviet Union. Professional social workers are commonly members of the staffs of the juvenile and women's institutions of the United States and in certain German states, particularly Saxony (the *Fürsorger*); while sociologists are found only in certain institutions in Illinois, Massachusetts and in the Soviet Union. On the whole penal institutions are still administered by an untrained and inadequate personnel.

The assumption that a penal institution is chiefly custodial has led to the belief that order, discipline, rigid rules and strict obedience are the corner stones of penal treatment. Offenses which interfere with the placid administration of the institution are regarded as the worst a prisoner can commit. Infractions are penalized by such punishments as deprivation of privileges, reduced rations and loss of merit marks. Severe offenses are usually punished with the dark cell,

reduced rations and a hard bed, by the strait-jacket, by handcuffing to the cell door or by leg irons. Punitive labor is sometimes employed; or the *salle de discipline*, as in France; the inhuman "sweat box," as in Florida; the stocks, as in Georgia; or the lash. Barbarous punishments long since gone from the criminal codes are still found in the disciplinary codes of many prison systems.

Prisoners who obey all rules receive rewards for their conduct in so far as the nature of their sentences permits. These rewards are in most countries extended by promotion systems. The newly committed prisoner in foreign prisons must spend the initial period in strict cellular confinement ranging from a few weeks or months to five years, as in Holland, or to ten years, as in Belgium for certain types of prisoners. Each promotion to a higher class brings increased privileges in the form of more frequent visits, letters, library books, exercise periods, better rations, food purchase rights, better cells and even temporary furloughs in the case of prisoners in the most advanced classes in the Soviet Union, Bavaria and Thuringia. The number of classes varies but is usually three or four. Such "progressive," or "step," systems exist also in penal institutions in the United States, where the time spent in the entrance class is usually brief and where full privileges are quickly extended, while misbehavior results in demotion to a disciplinary class.

A large number of prisoners are physically diseased upon commitment and require medical care. Moreover prison confinement is frequently accompanied by physical and mental disorders, among which homosexuality is one of the most difficult problems. Few penal institutions are adequately equipped or staffed to deal with questions of health and sanitation, which are doubly complicated by antiquated buildings overcrowded with prisoners. Some institutions, however, possess good hospitals and operating rooms and dental and venereal clinics. Prison food, an important element in maintaining health, is notoriously monotonous and is frequently poorly prepared. The fact that most prison riots in recent years have been precipitated by dissatisfaction with the food served has led the penal administrators of some institutions to employ trained cooks and dieticians who are responsible for wholesome and well balanced rations. The recreational activities of the institutions also play an important role in health. Physical recreation is usually limited to short

daily periods of walking, which, especially in European institutions, frequently are confined to small individual enclosures. The prisoners must often maintain a circular file; relative freedom of movement during recreation hours is, however, granted in most American institutions. Organized gymnastics, military drill, open air football or baseball games, boxing matches and field sports are coming into increasing use. In a few most modern institutions mental relaxation is afforded by periodic moving or talking picture programs, musical and dramatic activities, by the radio and by lectures. Practically no recreation is afforded detention or short term prisoners and many other prisoners are largely dependent upon the daily walk, the meager literature, infrequently doled out by a poorly equipped library, the occasional inspirational lecture and the prison paper. In European prisons, with few exceptions, the prison papers are published by the central administration; while in the United States, in Soviet Russia and in some Belgian institutions they are written and printed by the prisoners. In Europe only highly privileged prisoners, such as members of the discharge class of the German prisons or political prisoners, may subscribe to journals published outside the prisons. In the Soviet Union this privilege is given freely, while in the United States as a rule relatively few restrictions are imposed.

It has been assumed by many that ignorance is a cause of crime and that the education of prisoners is a means of reforming them. In some states the schools of penal institutions are under the direct supervision of state educational departments. The instruction of prisoners has long been academic and vocational. Academic education has but rarely transcended the level of the elementary school, although here and there in the United States high school subjects are taught, particularly in institutions for juvenile delinquents; university extension or correspondence courses are available in a few institutions. The average adult prison school in the United States is improperly housed and is taught by untrained inmate teachers using textbooks designed for children; the schools of juvenile institutions, however, ordinarily reach adequate standards. Vocational training is at a higher level than academic instruction; in some institutions it is intimately bound up with industrial and agricultural activities. Prison libraries are frequently overloaded with inspirational and religious literature, and adequate library service is

still absent in most institutions. Practically no provisions for education exist in jails for short term prisoners and in workhouses.

The socialization of prisoners has come increasingly to be regarded as an educational task informal in nature and inherent in every aspect of institutional life. The development of initiative and a sense of social responsibility in the prisoner is a prime requisite of this task but difficult to achieve, given the traditional organization of penal administration. Participation of prisoners in their own regeneration has been effected in some American, Belgian, Bavarian and Soviet institutions under some form of self-government; but except where the institutional staffs have been of rare quality, such plans have failed.

In all countries, the Soviet Union excepted, religious instruction through sermons and tracts is considered essential in penal treatment. Larger institutions have sometimes one staff chaplain and several part time chaplains, who visit prisoners in their cells and conduct chapel exercises. In some states the custodial functions of the institutions, particularly for women or juvenile offenders, are entrusted to religious orders. The level of religious instruction is generally low. The permanent chaplains in many institutions, particularly in the United States, are entrusted not only with the care of the prisoners' religious welfare but with the censorship of their mail, the conduct of the library, the editing of the prison paper or the statistical reporting of the institution's work. Such identification with the administration, the prisoners' traditional enemy, renders the chaplain's ministrations largely ineffective.

The growth of criminological science in the last century brought a demand for individualized treatment based on a scientific study of the prisoner in order to uncover the roots of his criminal conduct and to lay the basis for correctional or preventive measures. The result has been the establishment in many states of prison clinics or laboratories, staffed by psychiatrists, psychologists and sociologists. The clinics of Ingenieros in Argentina and of Vervaeck in Belgium, both established in 1907, have found many imitators especially since the World War. The psychiatric field services to prisoners in Massachusetts, Wisconsin and Maryland, the classification clinic of Sing Sing Prison, the state criminological service of Illinois, the research divisions of other numerous individual institutions or state correctional departments in the

United States are the products of the last fifteen years and may as time passes prove invaluable adjuncts to the penal system. In Europe Vervaeck's original clinic has grown into a state service with nine branch clinics, and Bavaria, Austria and Italy in particular have established centers for the scientific study of the prisoner. The Soviet Union through the State Institute of Criminology, to which an experimental prison is attached, and through many branch institutes is making important contributions to this field.

When prisoners leave penal institutions, they receive the balance of their earnings from prison labor, which as a rule amounts to very little, usually free transportation to some point within the state, some clothing and perhaps a small discharge allowance. Whatever further assistance is rendered them in their attempts to solve their problems of social readjustment is in some states given by state agencies but in most instances by private or quasi-public aid societies.

Each generation has labored for the reform of its penal institutions. Organized groups, such as the Philadelphia Society for Alleviating the Miseries of Public Prisons established in 1787, the prison societies of Boston and New York, the Howard League of Penal Reform in England, the Société Générale des Prisons of Paris, the national prison organizations of various countries and the international prison congresses, which have met since 1872, have urged not only humanitarian but also efficient treatment of prisoners. Even the prisons of the western world have not yet generally reached the minimum demands for decent physical treatment. Actual brutality has not been eradicated and is perhaps more common than is generally known; overcrowding, unsanitary conditions and poor or unpalatable food are prevalent notwithstanding the existence here and there of model institutions. The worst feature of contemporary penal systems, particularly as they affect adults, is the lack of intelligent, sympathetic and understanding relationships between staffs and prisoners. No great improvement in this field can be recorded until correctional work has been professionalized and institutions are staffed with trained and well chosen educators. Penal institutions are now largely peopled by recidivists; from 55 to 67 percent of those committed to the institutions of the United States, England, Scotland and Italy, for instance, have already served institutional sentences, while a much larger proportion have had previous convictions. This striking rate of recidivism illus-

trates not only the difficulties with which institutions must contend but also the imperative need for intelligent treatment in place of that now generally prevailing. The way is being shown in the juvenile training schools and women's reformatories of the United States and in the correctional labor colonies of the Soviet Union. In the last analysis penal institutions reflect the citizen's attitude toward the prisoner. As long as the criminal is regarded as a social outcast to be punished instead of a person to be helped and corrected, in other words, until the same attitude is adopted toward the treatment of criminality as is now taken toward ill health, prison reform will be sporadic and unscientific.

PENAL TRANSPORTATION. See TRANSPORTATION OF CRIMINALS.

PENN, WILLIAM (1644-1718), English religious leader, political thinker and colonial administrator. In spite of his father's official position and his own conventional training at Oxford and Lincoln's Inn and later in France, Penn cast in his lot with the despised Quakers and became one of their most active leaders. He joined the sect in 1667 and thereafter suffered

imprisonment repeatedly; indeed some of his most effective tracts (e.g. *Great Case of Liberty of Conscience*, 1670) were written during these periodical incarcerations.

An uncompromising defender of the cause of religious toleration, Penn issued many pamphlets which exerted a deep influence on the course of the protracted controversy in seventeenth century England. His friendship with and influence upon James II, at a time when the king was suspected of Catholic designs because of his removal of religious tests and his dispensing with penal laws in this connection, caused Penn to be distrusted by all parties, even by some of his Quaker friends. In his pamphlets justifying the royal policy and his own position Penn, a consistent opponent, like his co-sectarian George Bishop, of the theory of state sovereignty, insisted that no person or institution possessed the right to make laws and that therefore James was within his constitutional prerogatives in dispensing with them if he so desired. Penn's repudiation of the rapidly spreading theory of parliamentary sovereignty adumbrates many of the pragmatic premises of modern political science. Law is to be measured by the allegiance it obtains; no person or institution possesses the right to make laws; good government is to be judged by its works, not a priori by its title.

These attitudes Penn carried over in his work in America in preparing a frame of government for the province of New Jersey and more particularly in writing the charter for and in administering the proprietary colony of Pennsylvania. In the latter, freedom of conscience for all subjects, a liberal penal code, government based on almost universal male suffrage and association with neighbors, colored as well as white, were to be the guiding principles of what Penn called his "holy experiment." While the colony itself flourished, Penn's own experiences with it were unhappy. Largely because of his inability to be present in Philadelphia in person (he visited the colony only twice and each time his stay was less than two years), he was involved in continual struggle with the settlers. Penn's inability to meet his financial obligations resulted in his being thrown into debtors' prison in 1708 and in his effort to sell Pennsylvania to the crown.

Penn sought to join the English provinces together for common action and his project in 1696 for a federal "union of the colonies in America" not merely for defense but for regula-

tion of debts, commerce and justice constitutes the earliest step toward colonial unification. His respect for individual conscience and his desire to lessen the claims of national sovereignty led him to project a plan for a league of nations (1693) in which there were provisions for compulsory arbitration.

PENSIONS. The basis for pension grants, the method and scope of selection of beneficiaries, the fixing of the terms of payment and of financing have developed from personal and arbitrary grants, made under monarchical regimes by the sovereign to favored individuals, to public pension systems established by state and local governments. Public pensions were first granted to military servants retired because of injury or disablement and later to superannuated or disabled civilian public employees; they were finally extended to superannuated or disabled wage earners in private industry and also to special dependent groups for whom the consideration is not previous service, the latter class of beneficiaries including dependent children, dependent mothers before and after childbirth, the blind and the handicapped. As pension systems have thus broadened their scope they have come to be based more and more on contributory payments by the beneficiaries rather than on allowances paid entirely out of the public treasury. In addition to public pensions there are pensions paid by private employers in the field of industry and by non-commercial institutions and organizations. In

all of these the pension is a stated allowance paid at regular intervals over a period of years or for the balance of life, but, in contrast to wages, it is not a compensation for current service.

Although the pension system is a development of comparatively recent times, the personal pension, in which each award is made on a special basis, is said to have been known even in the time of the Roman Empire, chiefly in the form of grants for military service. It reached its most extravagant development in France under the *ancien régime*. The number of these pensions formed so threatening a fiscal problem in the sixteenth century that Sully included as part of his program of economy their considerable reduction. The pensions were usually awarded to the loyal servants and favorites of the king. The recipients of this aid and honor were not only past ministers of state and other dignitaries—distinguished generals, officers invalided in war, impoverished nobles, members of the representative assembly who could be counted on to do the government's bidding, men of letters distinguished for their talent or more often for their libelous attacks on supposed enemies of the state—but also royal favorites and courtesans without any pretext of public service. The awards, which were often in huge sums, were the discretionary, arbitrary acts of a sovereign subject to no fixed rules. Pluralism of pensions was by no means infrequent and the system of hereditary rights in pensions often perpetuated their discriminatory and extravagant features. In addition to the official list of pensions an unpublished one (known as the *Livre rouge*) was kept for those which could not be exposed to the public gaze. The revolution swept away the burdensome pension list of the old regime, which by that time had reached the colossal sum of 36,000,000 livres, and the system of discretionary pensions based on class favoritism. In their place were promulgated new principles of pension awards, which became the foundation of all the French systems of public pensions, state and local, for the nineteenth century. These principles involved a recognition of the public obligation to assist by pension, on the basis of definite rules, any person irrespective of station who had been employed by the public authorities and had become incapacitated after long and faithful public service or in consequence of an injury sustained in it or any other citizen who had sustained sacrifices in the service of society. Later an obligation was recognized to pension also dependents of such per-

sons in case of their death. The obligation to pay pensions to other persons on account of other services or circumstances was denied. Of course it took time for these principles to take root and for new systems to be developed in accordance with them.

The principles which replaced the personal pension by a regulated pension system were gradually adopted by other European countries in the nineteenth century, although in England the struggle against hereditary pensions did not terminate until the last quarter of the nineteenth century. At that time, as a result of the fight carried on particularly by Charles Bradlaugh, arrangements were made to commute at a "fair" market value such hereditary pensions as still existed. At the outset public pensions were restricted very largely to the military service and even to compensation for injury, disablement or death. The extension of pension provision to public civilian employees proceeded more gradually, and even now the right of the public employee is not conceded to be as strong a claim as that of the soldier, who presumably risks his life and severs his family connection.

The extension of pension provision to civilian public employment resulted largely from the pressure of organizations of employees. Those services in which employees were the first to organize in strong protective organizations or in which they were otherwise particularly influential politically were generally the first to secure pension legislation. Eventually the entire service of a national government or of a given large city was covered either by several departmental pension systems established at different times or by one single system evolved gradually. In these systems the majority of employees received no pension, as only those were included who had remained in the service for a specified period of years or were specifically disabled. Length of qualifying service or type of incapacity was carefully prescribed, and the amount of the pension was generally fixed as a definite proportion of the salary earned by the employee during the year or five years before retirement, multiplied by the years of service rendered; in cases of disability sustained in the performance of duty it was fixed as one half of the salary regardless of the length of service. The pensions to dependents were likewise definitely fixed.

One of the most important innovations arising out of the nineteenth century recognition that pensions differed from other governmental payments and called for special methods of financ-

ing was the establishment of special pension funds and the introduction of compulsory contributions by employees. Very frequently these were the direct outgrowth of the private benevolent funds or associations established by the employees for the care of their aged and needy members and financed by means of small assessments voluntarily imposed. As these proved unable to meet growing demands upon them, the associations turned to the public authority for aid, using in support of their demands the reasons which prompted governments elsewhere to provide pensions for their employees. Legislation was secured giving the fund a public status, making membership in it compulsory for all employees in the particular service, vesting the employing authority with the duty of collecting these contributions by deducting them from salaries, increasing the rates, providing for some kind of annual appropriation or subsidy to the fund by the authority, broadening the scope of the benefits to be provided and definitely fixing their amounts and conditions of payment.

Sometimes the establishment of these funds for employee contributions was made necessary by the difficulties of financing the increasingly large annual appropriation requirements of a non-contributory system. Moreover public authority held that the employees should not be absolved altogether from the obligation to provide for their old age. In other cases pension funds were established on the contributory basis from the outset. Since contributory pension funds offered substantial practical advantages and seemed to harmonize better with the spirit of the times they soon became, in most countries, more general than the non-contributory systems.

The moneys allocated to a pension fund would generally be fixed at such amounts as to be in excess of its immediate requirements; the excess would be invested and the interest earned added to the income of the fund. It was hoped that the disbursements would continue to be below the income and that the fund would be fully able to meet all the demands which might be made upon it. As these expectations were not based, however, upon actuarial investigations, the pension funds often met with serious financial difficulties, which forced the gradual adoption of actuarially funded systems.

The conception of the nature of pensions was significantly influenced by the development of new social attitudes. The employee no longer considered the pension as a reward or gift but

rather as a "deferred wage," in consideration of which, as part of the wage contract, the employee often accepted a lower wage than was offered to him elsewhere and refused opportunities later available for a profitable change of employment. Consequently he regarded the promise of a pension as a definite contractual obligation on the part of his employer and the pension as a definitely earned pay, even without any direct financial contributions on his part. At the same time administrators and civic leaders interested in the improvement of governmental service formulated the idea of the pension as an efficiency device, necessary for the orderly and humane elimination of superannuated and disabled employees no longer able to function efficiently, for the proper operation of the system of promotions, for the attraction of a better type of employees and for the improvement of working morale. With the development of the pension as the product of the joint contributions of the employer and the employee it came to be regarded more in the nature of a mutually beneficial business arrangement for insurance, since it protected the government service against inefficiency and the employee against dependency resulting from superannuation or disability.

A doctrine recently advanced and more far reaching in its implications regards the public service as the logical pioneer in the meeting of the old age problem as it affects the wage earner in modern society. This doctrine considers a pension as a compensation paid to the employee for the gradual destruction of his wage earning capacity in the course of his work. Retirement being a proper charge against the employee's entire period of active service, the employer should make contributions toward the employee's eventual retirement during each year of service of the employee, in a manner similar to that in which he annually sets aside a reserve against depreciation and obsolescence of his plant and machinery. Pensions, according to this doctrine, are an absolutely indispensable complement of wages.

These several new ideas compete with each other and agree completely in only one point—that pensions should be treated as earned and contractual in nature and not, as in earlier times, as free gifts.

Concurrently the pension systems in public service are undergoing profound changes. In the newer systems greater emphasis is placed on incapacity due to old age and on retirement upon

the attainment of a certain age than on the completion of a certain period of service in the particular employment. The principles of savings and insurance are given increasing recognition. Provision is made for refunding contributions, with interest, to the employee who resigns or is dismissed before qualifying for retirement or to the dependents of one who dies under circumstances not entitling them to a pension. In a few systems the contributions made by the employer become actually the inalienable property of the employee: they are refunded to him at the time of his separation from the service, are transferred to his new employment, if that is covered by any system of pensions, or are otherwise reserved for his old age.

In the development of the newer systems actuarial assistance is secured at the outset. The costs of pensions are carefully estimated on the basis of mortality rates, compound interest tables and other such devices. In order to provide funds sufficient to finance the promised pensions on a permanent plan contributions are fixed generally in the neighborhood of 5 percent of the salaries for the employees and 5 or more percent for the employing body. The actuarial reserve plan of operation is introduced, under which the contributions of each member and of the employing body on his account are accumulated with interest and are used to pay him a pension at the time of his retirement. Not infrequently the employees' contributions are kept in separate accounts and are used to provide two distinct benefits—one an annuity, the other a pension—which are fixed on some basis other than the final salary. The pension funds are treated as trust funds and their reserves, aggregating sometimes many millions of dollars, serve to safeguard the accumulated pension rights of their members.

Older funds which have not been properly organized are either reorganized on an actuarial plan or else the public authority assumes the responsibility of covering their annual deficits from the budget. In the latter case they are funds merely in name, since they have no fixed assets. The deficits of some of these funds reach amounts as large as 20 percent or more of the pay roll.

The actuarial funds and non-actuarial systems thus evolved generally cover between them the entire personnel of the national government of the given country and the greater part of its local governmental personnel. Some of these pension systems cover a hundred thousand or

more employees each and take care of thousands of pensioners.

In the military service the pensions paid to professional soldiers and naval officers are now based upon fundamentally the same considerations as those upon which the pensions for civil servants are founded, but since they developed earlier they tend more strongly to adhere to the earlier ideas and forms. Thus the idea of the pension as a reward for long service persists particularly strongly in their case. This is also true of pensions awarded to public officials of high rank or to their survivors. Such innovations as contributions by the persons covered and the actuarial reserve system of operation are strongly resisted, undoubtedly because of the notion that duties in the military service are especially exacting and entitle the servant to special recompense from the nation. Pensions to citizens temporarily enlisted in the military service and to their dependents have generally been paid only in the cases in which their service has resulted in injury or death, and the amount of the pension has been based on military rank, type of injury and the nature of the dependents. Only in the United States have pensions been paid to citizens who have sustained no injuries in the service and to their dependents, simply as a mark of the nation's gratitude for the fact that the citizen had enlisted or was enrolled in the service at a time when the nation was in peril.

The development of the pension systems in the public service was followed by the establishment of like systems by some private employers. In Europe this development began in the middle of the nineteenth century, but with the spread of general public provisions for old age pensions and of compulsory contributory insurance for all wage earners these private systems have disappeared or else serve merely as additional benefits. In the latter case they have followed the development of public pensions and in many instances have been made contributory and even contractual. The establishment of private pension systems in the United States has been more recent and on a larger scale, although they have been adopted generally only by the larger industrial organizations, covering only a small minority of industrial workers. By the nature of their terms, which in contrast to public systems seldom provide any safeguards to pension rights of the employees, and because of the large turnover of labor in the establishments maintaining them, they actually pay benefits to only a small proportion of em-

ployees. They are motivated moreover not only by the desire for efficiency but also by the desire to avoid any form of collective bargaining or trade union affiliation by the employees. In spite of the introduction of actuarial systems (in some cases, under an arrangement by which an insurance company for a specified premium underwrites a plan) the majority of these funds have been found actuarially unsound. In the United States a few professions and many trade unions and some non-commercial organizations (churches and universities) have also introduced retirement systems.

A far more significant development has been the introduction, beginning in Germany in 1889, of governmental provision against old age dependency. The effects of the industrial system in increasing the insecurity of the wage earner began to receive public attention with the enfranchisement of the masses and the spread of the labor movement. It became apparent that the problem could not be met by the individual employer or by each local community or even by the well developed systems of trade union benefits which existed in some countries; national or state action, involving a very different treatment from that afforded by the traditional poor relief or institutional care, seemed to be necessary. One country after another has established national or state systems of old age and invalidity pensions or of contributory old age insurance participated in by employer, employee and the government. Under these systems workers or citizens who have attained a certain age or are prematurely disabled and are incapable of self-support are paid a specified pension and are thus afforded assistance on a dignified and systematic basis. In this field too the trend is toward the replacement of straight pension systems by contributory schemes. Dependency caused by a disability traceable to an industrial accident has likewise become the subject of national or state action. Employers are compelled by law to insure their workers against accident, and the government merely supervises or administers the operation of the system. The state has come to provide pensions also for dependency arising from blindness, orphanage and maternity.

Thus pensions have evolved from monarchical grants for an aristocracy to a system of social insurance for industrial workers and citizens generally. Because of the large public expenditures involved this program has given rise in many countries to controversy between those who are unwilling to countenance its further

extension under normal circumstances and demand its curtailment in times of economic adversity and those who press for a broadening of its scope and point out the dangers of curtailment during periods of economic depression.

PEONAGE. Although this term is frequently applied to various forms of forced labor, it should be used only to designate virtual involuntary servitude growing out of payment in work for debts incurred. The element of indebtedness is the chief attribute of peonage, while it is not necessarily a feature of slavery, serfdom or contract labor. The period of servitude moreover is undetermined; it exists as long as the debt remains, whereas in the case of indentured or contract labor there is, at least in theory, a

definite time limit. In ancient and in certain primitive societies non-payment of debt frequently resulted in the enslavement of the debtor, sometimes permanently, sometimes until the equivalent of the debt had been worked out. The status of the debtor under such circumstances, however, was one of slavery, whereas the peon is not legally a slave. Peonage is to be found exclusively in a capitalistic society where the law protects the creditor and where employer-employee or similar relationships prevail. Its development has been relatively recent and chiefly in regions where other types of forced labor are not permitted, not infrequently after other forms of servitude, such as slavery, have been abolished.

The word itself is derived from the Spanish *peón*, literally a foot soldier, but it has been applied for some centuries to Indian and mestizo laborers in Spanish America and the Philippine Islands. When Spain conquered these territories the natives were subjected to forced labor, under the institutions of *repartimientos* and *encomiendas*, whereby a number of Indians, with or without the land they occupied, were assigned to a Spaniard, who was entitled to exact services from them. Their purpose was to bring the native population under Spanish rule and to reward the individual conquerors. This system created a peculiar type of bondage for the Indian population. Upon the abolition of the *encomiendas* toward the end of the colonial period the whites contrived to hold the native laborers under some form of involuntary servitude. One of the most common methods was to involve the Indians in debt and to retain them in service until the obligation should be discharged. Such measures appear to have been fully sanctioned by the laws of the Indies. As the laborer was usually called a peon, the system became known as peonage. It served its purpose best where the laboring population was small or disinclined to engage in steady employment for wages, where the scene of the industry was remote from other settlements or where working conditions were unpleasant. In some heavily populated areas, as on the Mexican and Andean highlands, it was employed to retain laborers when the small wage offered by the farm owners did not suffice to hold the natives against the attraction of working for themselves in the numerous agrarian communities or against that of the cities with their greater liberty of contract. Peonage as it existed in the highland districts of the Andes, territory which now falls within the boundaries of Co-

lombia, Ecuador, Peru and Bolivia, is well described by Jorge Juan and Antonio de Ulloa in their *Noticias secretas de América* (London 1826), written after their expedition in 1735-45. The Spaniard paid the tribute imposed upon the Indian, supplying him each year with a few yards of coarse cloth and food to supplement that produced on the small piece of land allowed for the Indian's own use; he sold to the natives at exorbitant prices the carcasses of any cattle which might die on the farm; he advanced money to the Indians for the occasional expenditures required for funerals, marriage ceremonies and other social or religious celebrations. Thus the natives became obligated for an indebtedness so large that it was virtually impossible for them to pay it back. The peon had to work for the patron three hundred days each year, receiving a wage so small—from twelve to eighteen pesos per year—that it by no means covered the charges against him. Consequently the longer he worked for the Spaniard the deeper he sank in debt. It was virtually a system of perpetual debt bondage, for if the farm were sold the Indian became obligated to the new owner, while the indebtedness of the father was inherited by the son.

This system survived in many of the republics which evolved from the Spanish colonies, although slavery was declared abolished by most of the constitutions of the newly formed governments. Little attempt has been made, however, to put an end to peonage until relatively recent years. It attracted most attention in Mexico, where a large part of the rural laboring class was legally held in debt bondage. Here as elsewhere the company store, the *tienda de raya*, played an important part in involving the peon in debt. The system existed in connection with manufacturing enterprises as well as on the plantations. In 1910 Turner estimated that one third of the entire population of Mexico were living under conditions of peonage. It reached its worst form in the tropical lowlands, in the tobacco plantations of the Valle Nacional, south of Vera Cruz, and in the sisal plantations of Yucatan; to these regions Indians from far distant parts were brought and held for severe labor under climatic conditions to which they were unaccustomed and in unsanitary living quarters, which led to great suffering and excessively high mortality. In Central America, Peru, Ecuador, Colombia and Venezuela much the same circumstances prevailed as on the Mexican highlands. On the Peruvian plateau, where peonage

was less a legally established system than an institution firmly fixed in usage and upheld by officers of the law, nearly all the agricultural labor and most of the mining, transportation and domestic services, both in the rural and in the urban districts, were performed by Indians attached by debt to the great haciendas. In the trans-Andean rubber district at the headwaters of the Amazon peonage was the accepted system of labor; in fact it was the only method whereby a sufficient labor supply could be secured for gathering the rubber. In this region, the Putumayo, peonage and its attendant atrocities attained the greatest notoriety. The situation was seriously aggravated because dominion over this territory was in dispute between Peru, Ecuador and Colombia, so that no one of the contending countries was able to establish effective police control, while the heavy tropical forest covering the entire district made law enforcement doubly difficult. In highland Ecuador a system of peonage existed under the name *concertaje*. The peon was usually required to work four days per week for the patron, receiving a wage equivalent to about one shilling per day. The hacienda store sold him supplies on credit; indeed it was usually impossible for him to secure necessities elsewhere. This and other practices got him deeply into debt to the farm owner. The debt was not legal unless acknowledged by the Indian in the presence of an official, but such recognition was regularly demanded by the employer at least once a year; the peon was not free to leave until the debt was discharged, and if he escaped officers of the law would bring him back. As in former times the debt and the debtor might be transferred to another person, particularly if the property changed hands. A similar situation existed in the various countries mentioned and to a lesser degree in other Latin American countries.

Dean Worcester reported to the United States government in 1913 that in the Philippine Islands peonage lay "at the root of the industrial system." The most flagrant abuses seem to have occurred among the non-Christian tribes, but the institution existed in some form in nearly all of the islands and was one of the most common methods of securing labor. It was estimated in 1928 that probably 20 percent of the population were peons.

In the United States peonage apparently developed mainly as a result of the abolition of slavery. As a penalty for vagrancy or petty crimes, especially when committed by Negroes,

it became customary in many districts to impose a fine and to accept payment of this fine from some employer of labor, who in return secured the services of the culprit until the amount of the fine had been worked out. It was not difficult to bring about the accumulation of other debts by excessive charges for tools, food, lodgings and clothing advanced to the victim. Thus a system of long continued, if not permanent, involuntary servitude developed. In many states, particularly in the south, the practice of peonage was recognized and sanctioned by law. Persons sentenced to such service were frequently kept under armed guards and on some occasions were shot upon attempting to escape. Another source of widespread peonage in the south was the custom of making yearly contracts with Negro farm laborers or tenants. Advances were usually made to them so that they could be held for the contracted period and coerced into renewal; even if no advances had been made no planter would hire laborers who had broken contracts. In addition statutes provided that to draw advances on "false pretenses" was a criminal offense. The courts interpreted every attempt to leave the plantation as an offense under the statute. The penalty was frequently a fine, which the complaining employer paid, so that the Negro was again in his power. At other times the threat of imprisonment was sufficient to make the laborer docile. Often an employer did not resort to the courts but took the law in his own hands.

White workers have been enmeshed in the peonage system less commonly than Negroes, but the system has affected them particularly where they have been contracted in cities for service in distant parts of the country. In such cases there has usually been misrepresentation of working conditions, and too late the victims have found themselves bound by a debt for transportation and supplies which it was almost impossible for them to repay. One striking example occurred in connection with the Maine lumber companies, which found it difficult to obtain workmen for their remote forest camps. Under provisions of a state law enacted in 1907, clearly for the purpose of putting laborers into the power of such companies, it was made a crime for a person who had received advance payment for labor in a lumber camp to evade through fraud the service specified in the agreement. The courts were accustomed to consider any attempt to escape the terms of the contract as fraudulently intended, even where misrepresentation was an issue. Virtual peonage was the

result, under conditions in which escape was almost impossible. In other parts of the country, as in North Dakota, New Mexico and Michigan—in fact, according to the report of the United States Immigration Commission in 1910, in all states except Oklahoma and Connecticut—similar practises have been known to occur, although no general system has been established.

About the beginning of the twentieth century agitation against peonage became widespread. The Thirteenth and Fourteenth amendments to the Constitution of the United States had been intended to prevent all involuntary servitude except as punishment for crime, and special anti-peonage legislation had been enacted by Congress in 1875. It was not, however, until a decision of the Supreme Court in 1910 (*Bailey v. Alabama*, 219 U. S. 219) declared state laws under which peonage had been tolerated to be unconstitutional that the system lost its legal sanction in the United States. The fact that violations occasionally come to light in different parts of the country reveals that the practise is by no means entirely eradicated.

Measures enacted in 1902 by the Congress of the United States to establish civil government in the Philippine Islands repeated the terms of the Thirteenth Amendment. There were no enforcing laws, however, and the former system of labor continued to exist. Particular attention was attracted to the matter following the decision of the United States Supreme Court in 1911, and a year later a law was passed avowedly intended to curb peonage in the islands. The practical result of this measure (Act no. 2098), however, was to give a certain legal sanction to the system, which continued generally to be employed. In 1927 the act was finally repealed by the Philippine legislature, but no positive legislation was enacted to take its place. As late as 1930 peonage was thought to be common in most parts of the archipelago.

In Latin America sentiment against peonage was awakened by the Mexican Revolution. The new constitution adopted by that country in 1917 abolished all forms of involuntary servitude except for crime. In 1916 a Peruvian law declared that Indians living on a hacienda could not be held by indebtedness to the owner, and two years later Ecuador withdrew all legal sanction of the practise of peonage. In these and in other countries of Latin America, however, the system has been difficult to eradicate and still survives to some extent, particularly in remote districts. As late as 1932 a competent observer

reported that most of the Indians living along the upper Napo River on the eastern slope of the Andes are bound by debt to white landowners. In many such districts, isolated as they are from main centers of population, where labor is hard to secure and retain by a system of wages, peonage is still used to obtain a labor supply.

Since the formation of the League of Nations much has been done by the International Labor Conference to throw light on the various forms of involuntary servitude, including peonage, found in different parts of the world. These investigations have given rise to a wide recognition of the principles that forced labor for any private purposes should be completely prohibited and that even indirect compulsion, a category in which peonage frequently belongs, should be forbidden.

PÉREIRE, JACOB-ÉMILE (1800-75), French railroad builder and financier. With his brother Isaac, who was associated with him in almost all his undertakings, Péreire was one of the principal figures in the development of French industry and commerce during the second third of the nineteenth century. A native of Bordeaux, he went to Paris in 1822 and threw in his lot with the Saint-Simonians. While he did not take to the religious mysticism of Enfantin, who had transformed Saint-Simonianism into a religious cult, Péreire always remained faithful to the original social and economic doctrines of the group, particularly those which looked to the betterment of society through the development of industrial organization. He collaborated in the editing of the *Globe*, which succeeded the *Producteur* as the Saint-Simonian organ; and although he resigned from his editorial post in 1831, following differences with Enfantin, he continued to defend the ideas of Saint-Simon in the *National* (1832-35).

It was in the columns of these journals that Péreire became an active champion of the new method of transportation, the railroad. Then proceeding, as he said, "to inscribe his idea on the earth," he built the first French steam line, that from Paris to Saint-Germain; he participated in a syndicate which constructed the line from Paris to Versailles; and thereafter he was associated with almost every French railroad building project of the 1830's, 1840's and 1850's. In 1852, after having seen the necessity for a closer link between industry and finance, Péreire founded the *Crédit Mobilier*. This joint stock company, which depended upon public security issues for its funds, extended long term credits for industrial and commercial ventures. The nature of its organization was at that time unique in French banking practise, as was also the fact that it issued securities in excess of its capital shares. The *Crédit Mobilier* lasted until 1871, when it was converted into a commercial bank for deposit and discount; but in the twenty years that it functioned it was the most important single agency in France for the promotion and reorganization of great business enterprises. It launched the *Compagnie Générale Maritime*, which in 1861

became the *Compagnie Générale Transatlantique*, several French, Austrian, Swiss and Spanish railroad companies, a host of municipal public utility companies and other credit organizations in France and abroad; and it was largely responsible for the merging of the numerous short French railroad lines into a few great systems. In this way Péreire carried out what he and his fellow Saint-Simonians had understood to be a necessity, the union of bank and factory, of credit and industry.

PÉRIN, HENRY XAVIER CHARLES (1815-1905), Belgian economist. Périn studied at the University of Louvain under Charles de Coux and succeeded him in 1845 to the chair of political economy. His book *La richesse dans les sociétés chrétiennes* (2 vols., Paris 1861; 3rd ed., 3 vols., 1882) signalized a reaction against the purely liberal doctrine of Bastiat and Cobden. While admitting the existence of economic laws and while according to public authorities and to social legislation the very restricted function of preventing obvious economic abuses, Périn set himself completely apart from the liberal school in introducing into economics a moral factor which he called Christian renunciation. According to Périn the principle of renunciation is the main motivating force in economic activity: the productivity of labor as conditioned by the discipline of the worker, the accumulation of savings as involving abstinence from consumption, the organization of credit as based on confidence and moral integrity, the peaceful cooperation of various classes in society as dependent upon the self-imposed restraint by the employees and employers; in short, all economic phenomena are simply manifestations of the principle of renunciation. This principle does not conflict with that of self-interest but creates the atmosphere of freedom essential to economic and social progress. The solution of the so-called

social problem, which he discussed in *Les lois de la société chrétienne* (2 vols., Paris 1875; 2nd ed. 1876), lies according to Périn in the moral sphere; namely, in the universal application of Christian charity in the wider sense to denote the general helpfulness and generosity to be followed by employers in their relations with their employees. Périn consistently opposed all forms of systematic intervention and state socialism, including the corporative regime advocated by Comte de Mun. His doctrines provided a stimulus to the group of Catholic economists known as the School of Angers in opposition to the school of Social Catholics.

Périn rejected all attempts at distinction between the religious and the civic sphere of human activity; in opposition to the "Catholic Liberals," who, as a concession to the times, reserved to Catholic thought the right to share in the general freedom of thought, he urged the full application of Christian principles to the entire domain of social and political life. In his essay *L'ordre international; principes fondamentaux du droit des gens* (Paris 1888) he formulated the Christian laws of international society.

PERJURY in the more common and less technical sense of the term—covering false testimony and statements in general, when given in the course of law administration—is at present reckoned as a serious obstacle to certainty of justice. A large part of the criminal investigator's work consists in a battle against the lie, as Hans Gross has said, and the same of course is true of the task of the triers of fact in civil litigation. Kenny characterizes the English divorce court as a "playground of perjury" and finds the crime still more prevalent in collision cases in the Admiralty. In the United States perjury was assailed at a Baumes committee hearing in New York in 1927 as the "evasive measure of organized crime" and the "backbone of alibis" for the fence and other most troublesome offenders. Lying on the part of witnesses because of gang intimidation is not uncommon. Wholesale resort to perjury in vice squad frame ups was revealed in 1930-31 by an investigation of the magis-

trates' courts of New York City. Counsel for various citizens' and insurance companies' associations formed to combat fraudulent claims have maintained that perjury was employed wholesale in the metropolitan district by "criminal syndicates and their satellites." There are on record a variety of proved miscarriages of justice, as in Borchard's collection, shown to have been wrought by lies of witnesses.

While compelling proofs that perjury has either increased or abated with the passage of the centuries are not ready to hand, it may be surmised from legal history itself that the false witness has always been a source of considerable vexation. The very modes of proof employed at one time and another exhibit a variety of attitudes ranging from utter pessimism to a considerable optimism as to the practicability of relying upon human perception. The various forms of ordeal, at one extreme, solved the problem by appeal to a test of chance or magic or to some deity. Trial by battle was a resort to physical combat. The procedures employing oaths of parties and compurgators relied upon the sanctity of the oath and counted noses. The older use of witnesses involved no testing by cross examination, the important thing was the oath or the fact that the witness appeared rather than the probative value or apparent credibility of what was said. The older trial by jury in which the jurors based their verdicts on their own knowledge and surmises was an intermediate form: it did not contemplate bringing the evidential basis of verdicts into the light.

Yet even the modern procedures relying upon proof by witness have not been characterized by any thoroughgoing reliance upon the perception of judge or jury. The long survival of the disqualification for interest in the Anglo-American law of evidence is an example in point. In many jurisdictions the testimony of an interested survivor to transactions with a deceased is still excluded on the theory that any other rule would imperil the estates of the dead. Every effort to extend the scope of the remedy of discovery before trial in order to obtain knowledge of an adversary's case has been met by judicial opposition on the ground that it would encourage perjury. There remain in the law of evidence various precautionary quantitative requirements, as, for example, that confessions be corroborated and likewise the testimony of accomplices and of complainants of rape. These are but a few of many restrictions upon proof by testimony which, coupled with the surviving requirement

of a religious oath, bear witness that perjury is still a procedural bugaboo.

The history of criminal prosecution and punishment of perjury also shows it to be a constant problem. Ancient law, distinguishing between the sin of falsely invoking a deity and the injury to a fellow by false testimony, reflects considerable doubt as to the propriety of punishing the former. As observed by Tacitus, it was the business of the gods to punish those who despised them. When the Roman censors attended to perjurers their *nota* involved *ignominia* rather than *infamia*. The luckless one was deprived of citizenship in the tribe to which he belonged and degraded to the ranks of the *aerarii*. If he was a senator he lost his seat. But there were also provisions penalizing the false witness. In the Twelve Tables it was directed that false witnesses be thrown from the Tarpeian rock. The penalties in ancient law tended to bear a direct equivalence to the injury in question. Thus the Code of Hammurabi provided: "If in a lawsuit a man gives false evidence, and the word he has spoken is not justified; then if that case involves a life, that man shall be slain," and the Roman *Lex cornelia de sicariis et veneficis* provided death for one who by false testimony procured the conviction of another for a capital offense.

The Middle Ages brought a changed emphasis, for the church took a great interest in false oath. Attempts to extend the ecclesiastical jurisdiction to perjuries in general as *delicta mixta* involved a stressing of the blasphemous aspect of false swearing in judicial proceedings. Even false promissory oaths were included. Canonical penalties inflicted by the church courts, such as deprivation and excommunication, the wearing of papers in the market place and so on, savored more of penance than of punishment. Yet temporal penalties existed, and although no longer always directly gauged by the mundane injury they still suggested symbolically the *lex talionis*. A common temporal penalty provided in the mediaeval laws of Italy, of various free cities of the Holy Roman Empire and in the German *Carolina* of 1532 is the loss of the two fingers with which the perjurer swore.

In England, however, there was little of temporal punishment. Witnesses were not used, and false swearers—parties and oath helpers—were so notoriously immune that this procedure fell into widespread contempt. In the case of early trial by jury jurors were occasionally imprisoned or amerced when their verdicts in criminal cases irritated the judges. In civil cases

there was the remedy by attain, but this was restricted to the assize. Both remedies moreover involved a confusion of the two separate objectives of reversing wrong verdicts and punishing false swearers. Nor did the ecclesiastical courts compensate for this practical absence of temporal punishment. Rather did the jealousy between lay and spiritual authorities prevent either from doing anything effectual in this quarter. As Pollock and Maitland have observed: "And so our ancestors perjured themselves with impunity" (*The History of English Law before the Time of Edward I*, vol. ii, p. 543).

With the development of proof by witnesses in the modern sense the separate problems of controlling jury verdicts, of promoting the spiritual salvation of those who sinned by swearing falsely and of punishing those who obstructed justice by untrue testimony began to be disentangled. In England Parliament intervened in 1540 and 1562 to put an end to the immunity of witnesses, providing for the recovery of pecuniary penalties by penal action against suborners of perjury and perjurers. In 1613 the Star Chamber declared perjury a crime by common law, which came to embrace wilfully false evidence of a material character given on oath and in a judicial proceeding. These restrictions were somewhat relaxed as time went on by statutes specifying various occasions other than judicial wherein false testimony might amount to perjury, and the judges decided that in any matter in which the law required an oath the taking of it falsely might still be a common law misdemeanor if the proceeding were not of a character to fit the perjury requirements.

By the twentieth century penal provisions dealing with the false witness were common but differed among the various nations on certain salient points. Thus France and Belgium punished only false "procedural" testimony, i.e. that given on trial. Germany, like England and the United States, went further, punishing testimony given under various other conditions although not generally. The Netherlands and Norway punished all wilfully false testimony and declarations which might have legal consequences. Austria, Belgium, Italy and Norway punished both sworn and unsworn false testimony, while England, France, Germany, the Netherlands and the United States punished only that given under oath or affirmation. In Belgium, England, France, Italy and the United States, but not elsewhere, the false testimony to support a criminal prosecution was required

to be of a material character. Germany, Italy and Norway provided for milder punishment or complete exoneration in cases where the false testimony might injure the witness himself or a near relative. Belgium, France, Russia and the Netherlands did not punish the unsuccessful instigator, while the other countries did. Germany even provided penalties for negligently false testimony.

But convictions for perjury, however prevalent the offense, remain few. There are unusual obstacles to prosecution, at least in England and the United States, thanks to the requirements of materiality and corroboration. Besides, whether out of sympathy for the witness badgered by counsel, because of the severity of maximum sentences—often comparatively long terms of imprisonment—or from doubts as to the corrupt quality of any given false testimony, juries are none too likely to convict. The United States census revealed that on January 1, 1923, there were but 171 persons convicted of perjury in penal and reformatory institutions (*Prisoners, 1923, 1926*, p. 28). The annual report of the attorney general of the United States for the fiscal year ending June 30, 1932, lists only 28 convictions of perjury. In greater New York during the three-year period 1925-27 there were 103 arrests for perjury and only 15 convictions, 1 arrest for subornation but no conviction, and 4 arrests for intimidating witnesses with 1 conviction. The 1929 criminal statistics for England and Wales note 124 perjuries "known to the police," 70 convictions and 7 where the charge was proved but an order made without conviction.

Recent statutory changes have for the most part been slight. The English Perjury Act of 1911 which codified the law on the subject includes forensic perjuries as formerly, false swearing before any official required or authorized to administer an oath and various unsworn false statutory declarations and representations to officials. In some instances the penalties provided are light, and some of the offenses are made summarily triable. But the requirements of materiality, wilfulness and corroboration are maintained. A few jurisdictions in the United States had early eliminated the requirement of materiality and some have codified a lesser offense of "false swearing." Proposals for checking perjury and facilitating its conviction, however, often resemble an inventory of all audible creaks in the machinery of justice. It is suggested that oaths be more solemnly adminis-

tered, that the standards for admission to the bar be raised, that judges be empowered to comment on the weight of evidence and become more aggressive in summarily holding lying witnesses for the grand jury, that the privilege against self-incrimination be abolished and so on. A few statutes requiring the defense to supply the prosecution before trial with the details of alibis to be relied upon are of interest, as is likewise the growing practise of employing the contempt power summarily against witnesses who are obviously and fantastically lying to block investigation. Research is being carried on, notably at Chicago, into the possibilities of a scientific lie detecting apparatus—the "cardio-pneumo-psychograph." But the most persistent and specific legal measure addressed to the general problem today is the proposal for enactment in New York and various other states of a false swearing provision, dispensing with the requirement of materiality, carrying the much lighter penalties of misdemeanor and creating an offense which might be triable more summarily by a court without a jury.

PERMANENT COURT OF ARBITRATION.

The most significant single achievement of the Peace Conference at The Hague in 1899 was the creation of the Permanent Court of Arbitration. The Convention for the Pacific Settlement of International Disputes of July 29, 1899, provided that each of the contracting states was

to select "at most" four arbitrators, who should be inscribed as "members of the Court" and serve for six years. States desiring to employ the arbitration procedure set out in the convention were to select from this larger body an ad hoc tribunal to arbitrate their dispute. An international bureau at The Hague was to act as the registry of the court; it was to be organized and directed by a *conseil administratif*, composed of the Netherlands minister of foreign affairs and the diplomatic representatives of the parties to the convention accredited at The Hague.

The Conseil Administratif was organized on July 19, 1900, and on October 1 a secretary general of the Permanent Court of Arbitration took up his duties. In April of the following year the signatories were notified by the Conseil Administratif that the court was formally constituted. In 1913 the seat of the court was moved to the Carnegie Peace Palace, which now houses also the Permanent Court of International Justice. Only slight changes in the Permanent Court of Arbitration were made in the revised Convention for the Pacific Settlement of International Disputes of October 18, 1907, and it exists today under the two conventions. It is maintained by forty-five states, parties to one or the other or both of the conventions. On April 7, 1932, there were 156 members of the court. The annual budget is about 90,000 Dutch florins, and in order to meet the expenses states are divided into seven classes, which pay from one to twenty-five units.

The Permanent Court of Arbitration is a panel rather than a court; it is permanent only in the sense that a panel always exists from which arbitrators may be chosen, that its affairs are administered by a permanent Conseil Administratif, and that it has a permanent secretary general. The members of the court have never met as a body. Differences to be arbitrated are not referred to the court as such, but to tribunals created from its membership. In one instance a difference was referred to arbitration in accordance with the procedure of the Hague convention, but no one of the three members of the tribunal was a "member" of the court. In several instances the tribunal has consisted of only one arbitrator.

The first arbitration was the Pious Fund Case between the United States and Mexico, brought before a tribunal in 1902. Prior to the outbreak of war in 1914 fifteen cases were submitted, although strictly not all of them were submitted to tribunals of the court; there were arbitral

awards in fourteen cases, a fifteenth being settled by direct negotiations. The most important of these cases were the North Atlantic Coast Fisheries Arbitration between the United States and Great Britain, the Casablanca Deserters Arbitration between France and Germany and the Preferential Claims Arbitration between Germany, Great Britain, Italy and Venezuela. Since 1920 six cases have come before such tribunals; in two of these cases the *compromis*, or agreement to arbitrate, was signed before the World War, and three others involved the United States, which is one of the few states not participating in the maintenance of the Permanent Court of International Justice. It would seem therefore that since the creation of the Permanent Court of International Justice there has been little disposition to resort to tribunals of the Permanent Court of Arbitration, despite the fact that it allows states greater freedom in controlling the membership of a tribunal. The following states have been parties in arbitrations before tribunals of the Permanent Court of Arbitration: France, Germany, Great Britain, Italy, Japan, Mexico, the Netherlands, Norway, Peru, Portugal, Russia, Spain, Sweden, Turkey, the United States of America, Venezuela.

Most of the members of the Permanent Court of Arbitration have never been called upon to act as arbitrators; in thirty years only twenty-nine of the several hundred people who have composed its membership have acted in that capacity. In 1921 a new function was conferred upon the members of the Permanent Court of Arbitration by the Statute of the Permanent Court of International Justice. Acting in national groups they now nominate candidates whose names go before the Assembly and the Council of the League of Nations in the election of judges of the Permanent Court of International Justice.

Although the role of the Permanent Court of Arbitration has become less significant since 1914, it has nevertheless exerted a large influence and it must be said to have served a most useful purpose. There are but few traces in the awards of the building of a new body of case law, but in each of them a contribution has been made to peaceful settlement. The success in establishing the court stimulated the conclusion of arbitration treaties, the number of which increased greatly after 1900. It was early recognized, however, that the Permanent Court of Arbitration was not an adequate agency for dealing with international disputes, and at the Second Peace Conference at The Hague a de-

terminated although unsuccessful effort was made to supplement it by the creation of a permanent court of arbitral justice. The Permanent Court of Arbitration survived the World War, which it failed to prevent, and in 1921 its experience and its very existence facilitated the creation of the Permanent Court of International Justice.

Consult: The *Rapport du Conseil administratif de la Cour permanente d'Arbitrage* has been published annually at The Hague since 1901. Awards of tribunals of the Permanent Court of Arbitration are also published by the International Bureau; convenient collections of them have been edited in English by James Brown Scott as *The Hague Court Reports* (New York 1916), and *The Hague Court Reports*, second series (New York 1932). See also *The Hague Arbitration Cases*, ed. by George Crafon Wilson (Boston 1915). For a digest of the awards in German, French and English, see *Handbuch der Entscheidungen des ständigen Schiedshofs 1902-1928*, ed. by E. Schmitz and others, *Fontes juris gentium*, Ser. A, sect. i, vol. ii (Berlin 1931). The complete records of arbitral tribunals are not readily available. See also bibliography of ARBITRATION, INTERNATIONAL.

PERMANENT COURT OF INTERNATIONAL JUSTICE. In the course of the drafting of the Covenant of the League of Nations, a renewed effort was made to establish an international court to supplement the Permanent Court of Arbitration. The Second Peace Conference at The Hague had failed in a previous attempt, and in 1919 the task seemed too baffling to be undertaken before the completion of a treaty of peace. Those who drew up the Covenant therefore contented themselves with the provision in article 14 directing the Council of the League of Nations to "formulate and submit to the members of the League for adoption plans for the establishment of a Permanent Court of International Justice." In accordance with this mandate the Council on February 13, 1920, created a Committee of Jurists, composed of ten members, who met during the following summer at The Hague and prepared a "draft scheme" closely resembling the *projet* for a court of arbitral justice drawn up by the Hague Conference of 1907. The Council, having considered this draft, transmitted it to the governments of the members of the League and after formulating various amendments referred it to the Assembly. At its first session in 1920 the Assem-

bly made still further amendments and subsequently approved the amended draft unanimously. The resolution of the Assembly provided for a protocol of signature and the statute was to come into force when this protocol of December 16, 1920, had been ratified by a majority of the members of the League. The necessary ratifications were given, and the statute came into effect in 1921. By March 1, 1933, the Protocol of 1920 had been signed on behalf of fifty-five members of the League of Nations and ratified by forty-eight. Unfortunately, it is not open to signature and ratification by states which are not members of the League of Nations or named in the Annex to the Covenant of the League of Nations.

The problem of electing the judges had frustrated the attempt to create a court in 1907, and even after the statute became effective, it remained to be seen whether the scheme for election by the Assembly and the Council of the League of Nations would work. Nominations of candidates were made by national groups in the Permanent Court of Arbitration, and for members of the League not represented there by national groups similarly constituted. The first election in 1921 occupied three days and involved the setting up of a joint conference committee. Five subsequent elections have been held, including four elections to fill vacancies caused by death or resignation. The second general election, in 1930, at which all of the judgeships had to be filled, was facilitated by the increase in the number of judges from eleven to fifteen.

Only states or members of the League of Nations may be parties in cases before the court; the conditions under which it is open to states not members of the League and not named in the Annex to the Covenant were laid down by the Council of the League, acting under article 35 of the Court Statute, in a resolution of May 17, 1922. Article 14 of the Covenant provided that the court should be "competent to hear and determine any dispute of an international character which the parties thereto submit to it." The first draft of the statute would have given the court a general compulsory jurisdiction; this was thought to be in advance of the times and the final text of the statute provides (article 36) that the court's jurisdiction "comprises all cases which the parties refer to it and all matters specially provided for in Treaties and Conventions in force." There is attached to the statute, however, an "optional clause" by which states

may "recognize as compulsory *ipso facto* and without special agreement," in relation to any other state accepting the same obligation, the jurisdiction of the court in four defined types of cases. The signing and ratifying of this optional clause lagged for several years, but the acceptance of compulsory jurisdiction was greatly stimulated by efforts of the Assembly after 1924; and the optional clause is now in force for forty-one members of the League, although on varying bases of acceptance. Compulsory jurisdiction is also conferred upon the court by several hundred multipartite and bipartite treaties. The General Act for Conciliation, Judicial Settlement and Arbitration, adopted by the Assembly in 1928 and now in force for nineteen states, is perhaps the most important separate instrument conferring jurisdiction on the court.

Article 14 of the Covenant provides that "The Court may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly." The advisory function has been so safeguarded by the rules of the court that it has become very closely assimilated to the judicial function. No advisory opinion is rendered until all interested states have had opportunity to be heard, and the provisions of the statute for the participation of national judges ad hoc chosen by a party which has no national on the bench have been extended to allow a state which is a party to a dispute before the court for advisory opinion to select a national judge to act ad hoc. No secret opinions have been given. The advisory opinions are published promptly, since 1931, in the collection which also includes the judgments. Frequent requests have been made for advisory opinions, all emanating from the Council of the League of Nations. One request was withdrawn, and in one instance—the dispute concerning eastern Karelia in 1923—the court declined to give an opinion.

The sources of the law to be applied by the court, as determined by the statute (article 38), include international custom, general principles of law recognized by civilized nations, judicial decisions, teachings of publicists and, most important of all, international conventions. During the first ten years treaty provisions, sometimes very intricate, have largely governed the disposition of most of the cases. While "The decision of the Court has no binding force except between the parties and in respect of that particular case" (article 59), its own precedents have frequently been cited by the court; and it is fast

building a body of consistent international case law.

Procedure before the court is governed by the provisions of the statute (ch. 3) and by rules of procedure drawn up by the court itself. The original rules, promulgated in 1921, have undergone several revisions; the present rules were adopted on February 21, 1931. Recently there has been a tendency to distinguish between the rules and the practise. The languages of the court are English and French, and its publications appear in both languages.

The president and vice president of the court, elected by the judges themselves, serve for three years. Three chambers of the court are constituted from time to time: a chamber of summary procedure, a chamber for labor cases and a chamber for communication and transit cases. This feature of the organization seems in some respects artificial, as is evidenced by the fact that only one case has been referred to any of the chambers. The smooth functioning of the court during its early years is in large measure due to the efficient registry, which consists of some twenty-five persons. The expenses of the court are paid by the members of the League of Nations, whether or not they are parties to the protocol of December 16, 1920; each year the budget approved by the court is submitted to the Assembly of the League of Nations and made a part of the League budget. For 1932 a budget of 2,663,702 Swiss francs was approved by the Assembly. The annual salary of the judges is now 35,000 Dutch florins, with certain additional allowances.

One of the chief difficulties encountered by the court during its first decade related to the dates of its sessions and the attendance of judges. The statute provides (article 23) for an annual session to begin on June 15 "unless otherwise provided by Rules of Court," and for extraordinary sessions at the summons of the president. It is most important that the court should meet annually, whether or not there are cases before it; but as the judges were not forbidden to engage in other compatible activities, sessions during the summer months tended to promote the idea that they were to be occupied only during their summer vacations. It was therefore difficult at times to secure the attendance of judges at extraordinary sessions. The rules of February 21, 1931, fix February 1 as the date of the annual session and include the following provision (article 27): "Judges are bound to be present at the ordinary session of the Court and

at all sessions to which they are summoned by the President, unless they are on leave or are prevented by illness or other serious reasons duly explained to the President and communicated by him to the Court."

This was one of the problems which led to a resolution by the Assembly in 1928, calling for a study of the statute with a view to the introduction of amendments "which experience may show to be necessary." The study was entrusted to a Committee of Jurists, set up by the Council of the League of Nations; and on the basis of its report a conference of signatories, acting in accord with the Tenth Assembly, opened for signature the revision protocol of September 14, 1929, to which were annexed various amendments to the statute. This protocol was intended to become effective in September, 1930, before the second general election of judges, but that was prevented by the objection of Cuba. The protocol can now come into effect only when it is ratified by all the parties to the Protocol of Signature of December 16, 1920, and by the United States. Up to March, 1933, it had received only forty-two of the forty-seven necessary ratifications. Some of the purposes of the proposed revision have been accomplished under the existing statute. It is to be regretted, however, that neither the present statute nor the proposed revision provides for amendment by less than unanimous action.

The Committee of Jurists which conducted the examination of the statute with a view to its amendment addressed itself also to problems created by the proposed adhesion of the United States to the Protocol of Signature of December 16, 1920. Such a proposal, made by the United States in 1926, had been previously considered by a conference of signatories held in that year; but no acceptable basis for agreement to the reservations offered by the United States had been found. The second conference of signatories in 1929 opened for signature a protocol of September 14, 1929, relating to the adhesion of the United States, based upon a report by the Committee of Jurists. This protocol has been ratified by forty of the signatories of the Protocol of December 16, 1920; it has been signed but not ratified by the United States.

During its first ten years, from February 1, 1922, to February 1, 1932, the court held 24 sessions, in the course of which it handed down sixteen judgments and twenty-two advisory opinions; on June 15, 1932, four cases were pending for judgment, and one request for an

advisory opinion was pending. Several judgments have been given in some of the cases. The following states have been parties before the court in cases submitted for judgment: Belgium, Brazil, Bulgaria, China, Czechoslovakia, Denmark, France, Germany, Great Britain, Greece, Italy, Japan, Lithuania, Norway, Poland, Sweden, Switzerland, Turkey and Yugoslavia. In several cases the compulsory jurisdiction provided by the optional clause has been invoked. Such a case between Belgium and China, in which the court issued various orders, was finally withdrawn. In several instances, however, the court has exercised a compulsory jurisdiction under other instruments. The most important cases before the court for judgment have been the steamship *Wimbledon* case (1923), the *Lotus* case (1927), the case of the free zones of upper Savoy and the district of Gex (1932) and the case between Denmark and Norway concerning eastern Greenland (pending).

Some of the requests for advisory opinions have related to matters of greater significance than most of the cases submitted for judgment. These requests grew out of several kinds of situations. Five requests were made by the Council at the suggestion of the Governing Body of the International Labor Organization, and were concerned with difficulties to which its functioning had given rise. Two requests dealt with difficulties which developed in the work of other international institutions—the European Commission of the Danube, and the Mixed Greco-Bulgarian Emigration Commission. Five requests had reference to the special relations of Poland and Danzig. Three requests were prompted by boundary disputes. The advisory jurisdiction of the court serves various purposes. It enables the Council of the League of Nations to proceed in dealing with disputes which come before it; it contributes to the smooth functioning of various other international institutions; and it offers to disputing states a procedure which avoids the finality of a judgment. In giving its opinions the court has consistently held itself within the limitations of judicial action. Strictly, there are no parties before the court when it considers a request for an advisory opinion; but notice of the request is immediately sent to every state entitled to appear before the court, and special notice is sent to states and organizations which are in a position to furnish information. In no case has the court acted without a presentation of views by interested states; and in most cases a public hearing

has been held. While it has no binding force, an advisory opinion possesses great authority, and there is no instance of its having been openly controverted. The most important opinions of the court have been those relating to the Nationality Decrees in Tunis and Morocco (no. 4), the frontier between Turkey and Iraq (no. 12), the jurisdiction of the European Commission of the Danube (no. 14) and the proposed Austro-German Customs Union (no. 20).

The success of the Permanent Court of International Justice crowns a generation of effort. The system for the election of the judges has worked with general satisfaction; the administration and procedure of the court have involved fewer difficulties than was expected; its jurisdiction is far more extensive than was anticipated; and its prestige and authority, although its work has occasionally evoked criticism, are world wide. A new body of international jurisprudence is gradually being accumulated. So firmly fixed is the court's position in the world's treaty law that its permanence now seems assured.

P., *The Permanent Court of International Justice* (2nd ed. Oxford 1932).

PERPETUITIES. The term perpetuities as used in ordinary speech means property interests which are everlasting. The earliest legal usage of the term closely approximated this lay usage. The English law had developed a type of landownership known as the estate tail. This type of estate was designed to pass by inheritance from generation to generation of the first grantee's descendants. The courts had sanctioned a particular mode of conveyancing known as the recovery, by which a tenant in tail could break the entail and convey effectively an estate in fee simple absolute. Grantors still desiring to create estates certain to pass perpetually to the descendants of their grantees sought to prevent resort to the recovery by inserting a proviso in the deed creating the estate tail that, upon any attempt to suffer a recovery, the estate of the tenant in tail should end forthwith as if he then had died. In declaring such provisos invalid about the end of the sixteenth century the courts spoke of the everlasting interests sought to be created as perpetuities. The provisos were said to be inconsistent with the power of free alienation which should be present in the owner of an estate tail, and hence unlawful. The courts were consciously safeguarding the free circulation of property.

The most common present legal usage of the term perpetuities dates from about the end of the seventeenth century. Subsequent to the Statute of Uses [27 Henry VIII, c. 10 (1535-36)] executory interests limited out of estates for years and out of estates in fee simple became frequent. By decisions reached in 1609 (Manning's Case, 8 Co. Rep. 94 b) and in 1620 (Pellis v. Brown, Cro. Jac. 590) these varieties of interests limited to arise at some time in the future were held to be indestructible by act of the person having the prior possessory interest in the property. Thus unless the law evolved some rule that these varieties of future interests must be so created that the period of indestructibility would be reasonably short, freedom of alienation of property would be seriously curtailed. The judicial response to this challenge was the so-called rule against perpetuities. A series of decisions beginning with the duke of Norfolk's case [(1682) 3 Ch. Cas. 1] and ending with *Cadell v. Palmer* [(1833) 1 Cl. & F. 372] fixed the period of convenience. Under the English common law rule thus derived, a future interest which is not destructible by the owner of a prior interest cannot be valid unless it is certain to become a vested interest at a date not

more remote than twenty-one years after lives in being at the creation of such interest, a period which may be extended for a few months to allow for actual periods of gestation which occur relative to the persons whose lives are used to measure the postponement. Any future interest so limited that it may retain its indestructible and contingent character until a more remote time is "inconvenient"; it is invalid as a perpetuity. The inconvenience, or invalidity, rests upon the assumed social undesirability of permitting substantial curtailment in freedom of alienation. This curtailment may take the form of a suspension of the power of alienation or a suspension of the fact of alienability. The power of alienation is unduly suspended when it is not certain that at a time not later than the end of the permissible period there will be in existence persons who, by all joining in a transfer of the property, can convey complete ownership. The fact of alienability is unduly suspended when the possibility that the indestructible and contingent character of the future interest will continue for more than the permissible period makes it unlikely that the owners of the future and other interests will unite in a conveyance of complete ownership. While phrased frequently as a rule against remoteness of vesting, the common law rule against perpetuities is merely an extension of the judicial safeguards of alienability.

In the United States the common law rule against perpetuities generally prevails. The New York Revised Statutes of 1830, however, embodied quite radical departures from it. Among other things the permissible period was shortened by eliminating the twenty-one-year period in gross and by cutting down to two the number of lives which could be used as a measurement of the permissible period. Other statutory provisions made this shortened permissible period applicable not only to the creation of future interests but also to the duration of trusts created to manage property and to apply the proceeds for the benefit of designated persons. These New York innovations influenced other states through two channels; namely, the westward migration of large numbers of New York residents and the handy embodiment of the New York statutes in the so-called Field Code which was prepared between 1860 and 1865. The states which by statute adopted some or all of the New York peculiarities have tended to change their statutes back to approximate closely the common law rule. At present, however, there are still a good number of jurisdic-

tions in which the permissible period is determined otherwise than under the common law rule; it is usually shorter.

A trust may be so constituted that the trustee is required to retain the specific property originally given to him in trust. In such a case the alienability of the property constituting the trust res is curtailed, if not destroyed, for the duration of such trust. If, then, the duration of the trust can exceed the permissible period fixed by the rule against perpetuities, it would seem that the underlying policy of the rule would have been transgressed and that the indestructibility of the trust should result in its invalidity. Gifts in trust for charities, however, are regarded as having such a social desirability that all question of measuring their permissible duration is excluded. In trusts for the benefit of individuals the requirements of the rule as to shifts in the legal and equitable interests normally prevent litigation arising as to the legality of the duration of the trust. In the so-called honorary trusts, created for a non-charitable purpose, such as the maintenance of a beloved animal or of a graveyard, the duration of the trust has been held subject to the restrictions of the rule against perpetuities. In such cases a present trust is treated as a perpetuity. Some jurisdictions, acting under the influence of the New York statutes, have treated the duration of a trust as restricted to the permissible period of the rule even when the trustee had full power to change the form of investments of the trust res. This holding embodies a social policy hostile to the protracted existence of the economic security assured to the beneficiary of a trust rather than the social policy safeguarding the easy transmissibility of property. Consequently the term perpetuity cannot with propriety be applied to such a trust.

Although the period of twenty-one years after lives in being was fixed upon by the courts as a proper period to safeguard the social interests involved in limitations which affected alienability, the English courts used this same period as the utmost time for which an accumulation could be directed [*Thellusson v. Woodford*, (1805) 11 Ves. Jun. 112]. This holding assumes that the social interest in the duration of a directed accumulation is at least highly comparable to the social interest in the postponement of free alienability. A realization that the permissible period should be shorter in the case of a directed accumulation has led to statutory modifications of this rule both in

England and in about one fourth of the states of the United States. Elsewhere the perpetuity period applies to accumulations.

The underlying policy of the law as to perpetuities, which is the safeguarding of the alienability of property, is supplemented by other rules regulating the extent to which present interests, in fee or for life, legal or equitable, can be created without the characteristic of full alienability. These rules do not involve perpetuities in any sense.

In the countries of the civil law there are varying degrees of liberality in allowing what is called a substitution. A substitution involves the creation of a future interest in a person who is entitled, on the occurrence of a stipulated future event, to demand that he be substituted for the erstwhile owner of the affected property. By regulating the circumstances under which substitutions are permissible and the period within which an otherwise permitted substitution must take effect, results comparable to the common law rule as to perpetuities are attained.

FOR CONTINENTAL LAW: Bureau, P., *La jurisprudence française en matière de substitutions* (Lille 1906), especially p. 182-90, and Appendix to Gray, *Rule against Perpetuities*, above cited.

PERSECUTION may be described as intolerance, implemented and active. It exists wherever differences of any kind are treated as moral and legal offenses and are penalized with disabilities and punishments. Whereas oppression is the exploitation of the weak by the strong regardless of the nature of the weak, persecution considers this nature, and makes it the justification of its cruelties. The persecutor usually rationalizes his conduct with the claim that he is saving his victims from worse evils than those which he inflicts or that he is saving the state, or church, or "law and order" and the like, from corruption and death. His basic sentiment is a mixture of intolerance and fear. To these, familiarity and custom usually add greed and other passions. Together these determine a point of view to which St. Augustine gave the classic expression: "When error prevails it is right to invoke liberty of conscience, but when on the contrary truth predominates, it is proper to use coercion." Macaulay, in his essay on Sir James Mackintosh, gave this dictum of Augustine's the aptest recorded restatement. "I," he wrote, "am in the right, you are in the wrong. When you are stronger you ought to tolerate me for it is your duty to tolerate truth. But when I am the stronger, I shall persecute you for it is my duty to persecute error."

The sentiment underlying this formula is, as indicated, by no means simple. The persecution syndrome is a manifold in which sadism often figures largely. Sometimes a feeling of inferiority is to be discerned for which the persecution activity compensates. Frequently there are elements of psychopathic fear. In the course of time, economic greed, or the lust for power, or both, complicate the picture. When persecution is established as a social practise and has become a part of the mores, rationalization of the Augustinian type enters in, to still the uneasy consciousness of the persecutor that he may be wrong and wicked, by means of the idea that he is saving the soul of his victim, or defending the church, the state, the family, the moral law and so on.

The persecutor's activities may range from

the enforcement of invidious social distinctions, such as the exclusion of Jews from certain clubs or hotels; through the elaborately implemented organization of persecution embodied in the Holy Inquisition; to the collective extermination of sects, cults and classes such as have been carried out upon the Hussites, the Albigenses and other minority cults by orthodox religious majorities, or the persecution of the "bourgeoisie" by Russian Communists and of the Jews of Germany by the German National Socialist party since it took power. Occasionally persecution may appear as a simple defensive policy of the state, having no other than a police function. The persecution of Christians under Marcus Aurelius has often been cited as an instance. But for the most part the intent and significance of persecution are those expressed by the dictum of St. Augustine, and its premise and ultimate logic are to be found in the Levitical code.

The treatment of witchcraft provides a representative case of the persecution syndrome. So long as faith was universal that witches existed and could practise their black magic, fear of them led everywhere to the enactment of laws designed to protect society against their power. Such laws are to be found in the Old Testament, among the decrees of Constantine and Constantius, in the canon law of the Catholic church. The deliverances of Luther and other Protestant leaders showed the same fear of magic and magicians and the same anxiety for defense against them. These fears and anxieties are faced by the perverse will to power and by other forms of the *psychopathia sexualis* which have led women to claim for themselves the dangerous abilities of the witch. The zeal, especially of churchmen, in persecuting witches migrated with other items of European culture over continental Europe and America. Thousands were brutally tortured and killed for witchcraft.

This zeal usually died out, as most persecution manias do die out, because of a change in the social climate, of a displacement of old fears by new interests and passions. For persecution is effective, in the first instance, only by the force of its own blind momentum, such as was manifest in the German persecution of the Jews during the spring of 1933. This initial momentum is by its very nature self-limiting and soon spent. Unless its force is canalized by means of adequately implemented laws reinforced by sanctions, it passes, leaving hardly more than a

scar. When, however, it is institutionalized through legislation, it becomes subject to all the influences which usually modify the administration of law, and in course of a longer or shorter time is tempered to the level of the prevailing opinion of the community. Thus it is normally subject to the irruption of new moods at home, to the penetration of doctrines and attitudes from other parts of the world. Persecutors and beneficiaries of persecution recognize this and fear it. Often they endeavor by means of the censorship of the press, of speech and of other forms of communication, to prevent or to shut out such doctrines and sentiments. So the Hitler government of Germany rigidly controls the organs of public opinion at home, and cuts off the unwelcome ones from abroad. Russian Communists and Italian Fascists have maintained a similar censorship from the day their respective governments came to power. Churches have vigorously enforced such censorships when they have had power, and still endeavor to do so.

For on the record, neither the abolition of differences nor the imposition of conformity can be accomplished through persecution. So long as there exists an awareness of an excluded alternative, the mind will either boldly seek that alternative or pretend to conform to prescribed conduct or doctrine while secretly dealing with the forbidden. Galileo and Descartes are representative of whole populations where persecution was the penalty for free thought. The state of mind brought on by prohibition in the United States and by various enactments against "criminal syndicalism," anarchism and communism, coincides with this pattern. Persecution sets up hypocrisy in both the persecutor and his victim but does not shut out alternatives of doctrine and of discipline; only extermination could do that.

Hypocrisy is not, of course, the sole consequence of persecution among the persecuted. After the initial reaction of fear has been spent, there appears usually a compensating adjustment whereby the intensity of faith increases proportionately to the danger which it brings. The doctrine and discipline which were the occasion for the persecution become more and more precious because of the persecution. The latter forces the persecuted together and binds them to one another by means of the feelings of solidarity and intimacy which their common danger awakens. It intensifies their differences from their neighbors, which are exalted from

natural variations into salvational ways of the life that the persecutors are declared to envy and therefore to penalize. Suffering is made a measure of virtue, whose high point is martyrdom for the cause. The martyrs of the persecuted group become its heroes. Their lives are studied, their sacrifices and their conduct emulated. Their tragic fate is interpreted and rationalized by an unquestioning faith in the ultimate triumph of the persecuted cause. Its now hunted and driven champions are glorified as the heirs of the future; they are the poor, the meek, the humble, who shall inherit the earth, the chosen people for whose sake destiny unfolds itself, the City of God which shall finally triumph over the City of the World.

Such a view was the view of the Christians, suffering persecution in pagan antiquity; of the Jews, suffering persecution in the prescientific and prehumanitarian Christian world. It is not a view which can long withstand the relaxation of persecution or the presence of alternatives. Since the middle of the eighteenth century the feeling for the parity of alternatives has reached wider and wider ranges of the civilized peoples of the West and has found a footing, somewhat precarious but nevertheless genuine, in the common sense of the western mind. As a consequence, the passionate insurgences of persecuting movements do not receive the secure standing within the mores which used to accrue to them. Soviet Russia ostensibly permits religious freedom. The strong public sentiment against Communism in the United States is confronted by aggressive manifestations of the traditional passion for civil liberties. The mad Nazi assault upon the German Jews is confronted and modified by the public opinion of the world. Persecution is as "always with us" as poverty or disease, but the resources of society against it are, today, perhaps not less improved than society's resources against poverty and disease.

PERSONAL LOANS. *See* LOANS, PERSONAL.

PERSONALITY. The term personality is too variable in usage to be serviceable in scientific discussion unless its meaning is very carefully defined for a given context. Among the various understandings which attach to the term there are five definitions which stand out as usefully distinct from one another, corresponding to the philosophical, the physiological, the psychophysical, the sociological and the psychiatric approaches to personality. As a philosophical concept, personality may be defined as the subjective awareness of the self as distinct from other objects of observation. As a purely physiological concept, personality may be considered as the individual human organism with emphasis on those aspects of behavior which differentiate it from other human organisms. The term may be used in a descriptive psychophysical sense as referring to the human being conceived as a given totality, at any one time, of physiological and psychological reaction systems, no vain attempt being made to draw a line between the physiological and the psychological. The most useful sociological connotation which can be given to the term is an essentially symbolic one; namely, the totality of those aspects of behavior which give meaning to an individual in society and differentiate him from other members in the community, each of whom embodies countless cultural patterns in a unique configuration. The psychiatric definition of personality may be regarded as equivalent to the individual abstracted from the actual psychophysical whole and conceived as a comparatively stable system of reactivity. The philosophical concept treats personality as an invari-

ant point of experience; the physiological and psychophysical, as an indefinitely variable reactive system, the relation between the sequence of states being one of continuity, not identity; the sociological, as a gradually cumulative entity; and the psychiatric, as an essentially invariant reactive system.

The first four meanings add nothing new to such terms as self or ego, organism, individual and social role. It is the peculiarly psychiatric conception of personality as a reactive system which is in some sense stable or typologically defined for a long period of time, perhaps for life, which it is most difficult to assimilate but important to stress. The psychiatrist does not deny that the child who rebels against his father is in many significant ways different from the same individual as a middle aged adult who has a penchant for subversive theories, but he is interested primarily in noting that the same reactive ground plan, physical and psychic, can be isolated from the behavior totalities of child and adult. He establishes his invariance of personality by a complex system of concepts of behavior equivalences, such as sublimation, affective transfer, rationalization, libido and ego relations. The stage in the history of the human organism at which it is most convenient to consider the personality as an achieved system, from which all subsequent cross sections of individual psychophysical history may be measured as minor or even irrelevant variations, is still undetermined. There is no way of telling how far back in the life of the individual the concept of an essentially invariant reactive system may usefully be pushed without too disturbing a clash with the manifest and apparently unlimited variability of individual behavior. If this conception of personality is to hold its own, it must in some way contradict effectively the notion of that cumulative growth of personality to which our practical intelligence must chiefly be directed. The psychiatrist's concept of personality is to all intents and purposes the reactive system exhibited by the precultural child, a total configuration of reactive tendencies determined by heredity, and by prenatal and postnatal conditioning up to the point where cultural patterns are constantly modifying the child's behavior. The personality may be conceived of as a latent system of reaction patterns and tendencies to reaction patterns finished shortly after birth or well into the second or third year of the life of the individual. With all the uncertainty that now prevails with regard to the relative

permanence or modifiability of life patterns in the individual and in the race it is unwise, however, to force the notion of the fixation of personality in time.

The genesis of personality is in all probability determined largely by the anatomical and physiological make up of the individual but cannot be entirely so explained. Conditioning factors, which may roughly be lumped together as the social psychological determinants of childhood, must be considered as at least as important in the development of personality as innate biological factors. It is entirely vain in the present state of knowledge to argue as to the relative importance of these two sets of factors. No satisfactory technique has been developed for keeping them apart and it is perhaps safe to take for granted that there is no facet of personality, however minute, which is not from the genetic standpoint the result of the prolonged and subtle interplay of both.

It is unthinkable that the build and other physical characteristics of an individual should bear no relation to his personality. It is important to observe, however, that physical features may be of genetic significance in two distinct respects. They may be organically correlated with certain psychological features or tendencies or they may serve as consciously or unconsciously evaluated symbols of an individual's relation to others, belonging properly to the sphere of social determination. An example of the former class of physical determinants would be the association, according to Kretschmer, of the stocky, so-called pyknic, build, with the cyclothymic type of personality, which in its psychotic form shows as manic depressive insanity, the so-called asthenic and athletic builds being associated with the schizothymic type of personality, which, under the pressure of shock and conflict, may disintegrate into schizophrenia. An example of the latter type of determination, stressed by Alfred Adler and his school of individual psychology, would be the feeling of secret inferiority produced in a person who is of abnormally short stature, and the ceaseless effort to overcome this feeling of inferiority by developing such compensatory mechanisms as intelligent aggression or shrewdness, which would tend to give the individual a secondary ego satisfaction denied him by his sense of physical inferiority. It is highly probable that both of these genetic theories of personality have a substantial core of value although too much has doubtless been claimed for them.

The most elaborate and far reaching hypotheses on the development of personality which have yet been proposed are those of Freud and his school. The Freudian psychoanalysts analyze the personality topographically into a primary id, the sum of inherited impulses or cravings; the ego, which is thought of as being built upon the id through the progressive development of the sense of external reality; and the superego, the socially conditioned sum of forces which restrain the individual from the direct satisfaction of the id. The characteristic interplay of these personality zones, itself determined chiefly by the special pattern of family relationships into which the individual has had to fit himself in the earliest years of his life, is responsible for a variety of personality types. Freudians have not developed a systematic theory of personality types but have contented themselves with special hypotheses based on clinical evidence. There is no doubt that a large amount of valuable material and a number of powerfully suggestive mechanisms of personality formation have been advanced by the Freudian school. Even now it is abundantly clear that an unusual attachment to the mother or profound jealousy of the older or younger brother may give the personality a slant which remains relatively fixed throughout life.

Various classifications of personality types have been advanced, some of them based on innate factors, others on experiential ones. Among the typological pictures the one worthy of special note is perhaps that of Jung. To him may be attributed the popular contrast between introverts and extraverts, the former abstracting more readily from reality and finding their sense of values and personal identification within themselves, while the latter evaluate experience in terms of what is immediately given by the environment. This contrast, it is true, means something substantial, but it is unfortunate that a host of superficial psychologists have attempted to fix Jung's meaning with the aid of shallow criteria of all sorts. Jung further divides personality into four main functional types—thinking, feeling, sensational and intuitive—the two former being called rational, the two latter irrational. For these somewhat misleading terms, organized and unorganized may fitly be substituted. The classification according to functional types is believed by Jung to intercross with the introvert extravert dichotomy. The validity and exact delimitation of these terms present many difficult problems of analysis.

There is much that is suggestive in his classification of personality and it may be possible to integrate it with the dynamic theories of Freud and Adler. What is needed at the present time, however, is the ever more minute analysis and comparison of individual personality pictures.

There is an important relation between culture and personality. On the one hand, there can be little doubt that distinctive personality types may have a profound influence on the thought and action of the community as a whole. Furthermore, while cultural anthropologists and sociologists do not consider that the forms of social interaction are in themselves definitive of personality types, particular forms of behavior in society, however flexibly the individual may adapt himself to them, are preferentially adapted to specific personality types. Aggressive military patterns, for instance, cannot be equally congenial to all personalities; literary or scientific refinement can be developed only by individuals of highly differentiated personalities. The failure of social science as a whole to relate the patterns of culture to germinal personality patterns is intelligible in view of the complexity of social phenomena and the recency of serious speculation on the relation of the individual to society. But there is growing recognition of the fact that the intimate study of personality is of fundamental concern to the social scientist.

The socialization of personality traits may be expected to lead cumulatively to the development of specific psychological biases in the cultures of the world. Thus Eskimo culture, contrasted with most North American Indian cultures, is extraverted; Hindu culture on the whole corresponds to the world of the thinking introvert; the culture of the United States is definitely extraverted in character, with a greater emphasis on thinking and intuition than on feeling; and sensational evaluations are more clearly evident in the cultures of the Mediterranean area than in those of northern Europe. Social scientists have been hostile to such psychological characterizations of culture but in the long run they are inevitable and necessary.

PERSONNEL ADMINISTRATION may be defined as the planning, supervision, direction and coordination of those activities of an organization which contribute to realizing its defined purposes with a minimum of human effort and friction, with an animating spirit of cooperation and with proper regard for the genuine well being of all members of the organization. More specifically the scope of personnel administration includes the securing, selection and placement of workers, training them to qualify for particular jobs and organizations; corrective and preventive health work; safety work; adjustment of grievances and disciplinary problems; supervision of the conduct of negotiations for the determination of the terms of the labor or employment contract under which all workers are hired; the maintenance of services which will take into account the amenities of the employment relation and the surrounding conditions of work. The necessity for coordinating these activities arises in large scale undertakings with an intricate division of occupations and a numerous and diversified labor group, whose cooperation and good will are necessary both for efficiency and for their own economic welfare.

Thus defined personnel administration is ap-

licable to and necessary in every organization involving a large body of employees, including municipal, state and federal governmental bureaus; public and semipublic institutions, such as universities, hospitals and prisons; and even an entire national economy, as in the Soviet Union. The fact that as a recognized and special function of management it has been most fully developed in private industry and under the partial spur of the profit incentive by no means precludes the application of its basic principles to non-profit making institutions. Nor does the existence of such organizations for collective negotiation as labor unions obviate the need for effective personnel administration. Of course the interpretation of economic effectiveness and economic welfare will vary widely according to the purpose of the enterprise, as will also the organization of the work, the selection of the directing expert or specialist, the scope of decisions made and the process by which they are reached.

In the United States personnel work as a distinct and separately named function among the major executive divisions of an organization dates from about 1912, when at least a dozen corporations saw the advisability of grouping under one executive various activities which had been undertaken in order to increase labor output and cultivate the good will of employees. These ranged from experiments in scientific management in its more limited scope, such as time study and wage incentive methods, and in so-called welfare work to a variety of activities now included as part of the personnel function, which were based on recognition of the fact that maximum, continuous quality output involved the intelligent cooperation of the workers.

These several activities and procedures gradually came to be considered necessary with the disappearance of the personal relation between workers and management or ownership as a result of the growth of large scale corporate enterprise, and with the increasing division of labor and the necessity of lowering labor costs per unit of product. Other accelerating influences were the shortage of labor during the World War and the incentive given to proper work organization by wartime production. In connection with these and as a result also of the emphasis placed at that time on the advantages of collective over individual bargaining, personnel work was often accompanied by various schemes of employee representation.

At the present time personnel management

is well established in the United States. About one thousand companies, including a majority of those with more than fifteen hundred workers, have personnel executives and departments and many others carry on one or more personnel functions without specialized executive supervision. Personnel vice presidents or otherwise prominent executives, known by such titles as personnel managers, industrial relations managers and labor managers, are to be found not only in manufacturing and mercantile companies but in banks, insurance companies, public utilities and mines.

The authority and responsibility of the personnel executive are, in the vocabulary of administrative science, those of a "staff" rather than a "line department." This distinction carries over from army organization theory the segregation of the operating from the advisory or facilitating functions and duties. The personnel manager and his staff exercise no direct authority over dealings with workers in the operating or line departments of the organization. Hence in close cooperation with the various department heads who direct workers the personnel manager is typically authorized to hire new employees, supervise their training, participate in deliberations where terms of employment are settled, assist in the handling of difficult disciplinary problems and assume responsibility for the conduct of health, safety and service work of all sorts. Beyond these operating duties his major task is to work with the entire executive group in consultation, education and advice and to offer to employees personal aid and counsel on particular difficulties to which their own department heads cannot give adequate attention.

In order to exercise effective influence in such matters of policy and procedure as have just been outlined the executive charged with responsibility for the personnel function should be on an equal footing with the major, staff and line executives of an organization. In many companies he therefore occupies one of three or four vice presidencies. In others he is a staff assistant associated directly with the president of the company or has the same executive status as the sales manager, production manager or treasurer. In enterprises where there are fewer than five hundred employees the president himself may assume responsibility for the personnel function, supervising the work of the employment interviewer, the nurse and other members of the specialized personnel staff.

This remarkable growth of the organization of personnel work suggests that in undertakings where the criterion of profit making stands as the important test of social worth, the owners or managers must be satisfied that all staff services contribute more or less directly toward success in the usual business sense. It has been demonstrated that what only a few years ago would have been regarded as a very liberal industrial relations policy can in fact be justified as contributing to employee morale and effectiveness at work. The development of the personnel function has moreover brought with it great advances in the application of attendant specialized activities: in industrial psychology, vocational guidance and the elaboration of effective techniques for the most economical utilization of the efforts of the workers.

There has also been a growing recognition of personnel work in institutional management, where its scope broadly corresponds to that in private industry. In the educational world it has been highly developed more with regard to the relationship of the students to the institution than to that of the faculty and other employees to the institution.

In contrast to the development of personnel administration in private enterprise, progress in the field of American public services has been slow and piecemeal; for many of the terms of employment, such as salaries, hours, tenure, promotion and other conditions, are often specified in legislative enactments or administrative regulations, so that direct negotiations with regard to them are not likely to be entered into. Under the aegis of civil service provisions for municipal, county, state and federal employees, however, much attention has been centered on the procurement of competent and qualified workers for the available positions. With the acceptance of a broader concept of the personnel function much stress is also being laid on the value of proper classification of governmental workers in respect to positions, titles, duties, relative salary scales and the like.

The functional development of personnel administration in its characteristic form has been far more extensive in the United States than in Europe. It is true that individual corporations in Great Britain, Germany, Czechoslovakia and Holland may be cited as examples of an administrative structure similar to that in the United States and that such terms as labor manager, industrial welfare manager, industrial relations department, personnel director are employed

also in Europe. In England there is an Institute of Labor Management composed of executives of several scores of English companies where work parallels more or less closely that of personnel departments in the United States. In England, Germany and the Soviet Union industrial and vocational psychology has received more serious attention in specialized institutions, often fostered by educational interests. In some instances, as in the firm of Rowntree & Company, Ltd., a degree of expert specialization in the whole personnel field has been developed which compares favorably with the most marked advances in the United States. Yet as a movement of distinctive, coordinated, inclusive, managerial status the rise of specialized personnel administration in European industry is far less impressive than in the United States.

Any appraisal of the difference in development of industrial relations as between Europe and the United States must be conditioned by the social philosophy of the student. An examination of employer-employee relations in the overwhelming majority of corporations in the United States as contrasted with those in Europe or in the field of government employment shows that there is usually no instrumentality for collective negotiations with the workers. While in Europe only a few of the corporations with well developed personnel departments are run on a non-union basis, in the United States there are few instances of enterprises where personnel work is coordinated with a system of collective bargaining with unions in which the latter encourage and participate in the personnel function, and only a minority have any scheme of employee representation. While logically there is no conflict of function between the work of the personnel executive and that of the labor union, in practise it is claimed that improvements in employment conditions in many plants resulting from competent personnel work have lessened the interest of many workers in joining labor unions; and in some instances it is likely that this result has been intended by managements. On the other hand, account must be taken of the prior growth in Europe of a strong labor movement, the existence of a more elaborate code of protective labor legislation including social insurance, and the development of other kinds of industrial cooperation in the form of industrial relations councils. Another factor has been the relatively slow recognition abroad of the possibilities of a science of administration. The weakness of labor unionism and the ab-

sence of such social provisions in the United States have encouraged the development of personnel work in private industry, although it must not be assumed that all the interests of the workers in a company are in complete harmony with those of managers or owners. It is obvious that if the objective of the company is merely to obtain maximum profit for absentee stockholders, employee interest and loyalty can never be developed to the most significant degree. Such restraints on the rate of profit as participation by the workers in the net yield of business, combined with a genuine interest in performing an honest service to the public at a reasonable price, would perhaps yield more far reaching results in employee morale. But whatever modifications or transitions in the title to corporate ownership or in the nature of the employer-employee relationship may occur in the United States, the integral administrative value of the personnel function promises to stand as a permanent asset in the development of a science of administration.

PERTZ, GEORG HEINRICH (1795-1876), German historian. Pertz was born in Hanover and studied at the University of Göttingen. His chief importance lies in his connection with the founding and publication of the *Monumenta Germaniae historica* (vols. i-cxvii, Hanover 1826-30), that enormous collection of sources of German mediaeval history which has become the foundation of all research into German history. The project itself was started by Baron vom Stein, who in 1819 founded the *Gesellschaft für Deutschlands Ältere Geschichtskunde*, for the publication of these source materials. He aimed to supply for Germany what Muratori had done for Italy and the Maurists for France. Stein was impressed with the first published work of Pertz, *Die Geschichte der merowingischen Hausmeier* (Hanover 1819) and invited him to cooperate in the new enterprise. He was subsequently appointed director of the scientific work and editor of the *Archiv der Gesellschaft für ältere deutsche Geschichtskunde*, which was published in connection with the organization. Pertz traveled widely gathering archive materials and he himself prepared the editions of the first volumes on the Carolingian period.

The motives behind the publication of the *Monumenta* series were both patriotic and scientific. Stein, Pertz and Böhmer, who later became associated in the work, sought to foster the development of a historical sense and bring before the Germans the brilliant epoch of their Middle Ages when they had possessed a powerful empire and vigorous rulers. Out of the memory of the common national history was to come the spiritual unity of all the German people. Scientifically this work was of tremendous significance in setting a model for the critical editions of source materials. Pertz' editions were based on a critical comparison of the various manuscripts and were guided by the aim to reproduce the works of the authors with all their peculiarities. He continued to direct the *Monumenta* until 1873 and developed a whole school of *Monumenta* workers, drawn mainly from Ranke's seminar in Berlin. The most distinguished of these was Georg Waitz, who succeeded him as editor of the series.

FRANZ SCHNABEL

Consult: Waitz, G., "G. H. Pertz und die Monumenta Germaniae historica" in *Gesellschaft für ältere deutsche Geschichtskunde, Neues Archiv*, vol. ii (1876-77) 451-73; Bresslau, H., *Geschichte der Monumenta Germaniae historica*, *Gesellschaft für Ältere Deutsche Geschichtskunde, Neues Archiv*, vol. xlii (Hanover 1921).

PESCH, HEINRICH (1854-1926), German economist. Pesch studied law and social sciences in Bonn from 1872 to 1875 and in 1876 joined the Society of Jesus. He experienced his first contact with industrial and social problems while studying in Lancashire during the *Kulturkampf*. Later in Bohemia he became intimate with Rudolf Meyer, who was carrying on the traditions of Freiherr von Vogelsang. As spiritual in the Mainz theological seminary from 1892 to 1900 he became acquainted through Bishop Haffner with the social views of Bishop von Ketteler (*q.v.*). Here he published his *Liberalismus, Sozialismus und christliche Gesellschaftsordnung* (2 vols., Freiburg i. Br. 1893-1900; 2nd ed. 1901), a systematic and historical study of the relation of Catholic social thought to the two dominant currents of the nineteenth century. From 1901 to 1903 Pesch studied economics in Berlin, where he came under the influence of Schmoller, Sering and above all Adolf Wagner. Thereafter he resided in Marienfelde near Berlin, where he worked upon his *Lehrbuch der Nationalökonomie* (5 vols., Freiburg i. Br. 1905-23; vols. i-iii, 2nd-6th ed. 1924-26; vols. iv-v, 1st-2nd ed. 1923).

At a time when German economic discussion was gradually inclining toward the view that value judgments should be excluded from economic theory, Pesch firmly upheld the moral basis of economics. The function of the economist, he maintained, is not only to study economic activity but also to evaluate it in terms of human welfare—the ultimate criterion of all social and economic activity. Pesch rejected the principle of liberalism as an inadequate basis for social organization and dismissed Marxian socialism as a mere projection of the liberal doctrine. His own social system, which he called Christian solidarism, represented a moral and organic conception of society based on the principle that man rules the world by God's commandment and that he is the subject and supreme goal of all social activity. He held further that a strong bond of solidarity pervades the entire social organization; the welfare of one vocational group is closely dependent upon that of all other groups and the well being of future generations is conditioned by the performance of the past generation. *Volkswirtschaft* is thus the economics of the people as an integrated social unit bound by common interests which find their expression in the national state—the highest form of social organization. Pesch consequently rejected internationalism; he repudi-

ated narrow nationalism, however, in his emphasis upon the virtues of justice and love for all nations.

Fundamental to Pesch's system was his insistence that labor is the basic source of wealth and superior to the non-human factors of production and that private economic interests should be subordinated to the collective welfare of the people. 'This welfare does not arise from the automatism of free activity of the individual but is the product of an order in whose building individual, social and political factors share, an order which harmonizes the interests of labor and management, reconciles the freedom of the individual with the well being of the whole and preserves the greatest amount of freedom consistent with the common good. Pesch saw the best guaranty of such an order on the one hand in the reason and conscience of the individual, on the other in an economy organized into vocational groups and integrated in the state.

G. BRIEFS

Consult: Weinberger, Otto, in *Zeitschrift für die gesamte Staatswissenschaft*, vol. lxxxii (1927) 512-35; Reder, Franz, 'Die Grundlagen der Wirtschaftstheorie Heinrich Peschs' in *Jahrbücher für Nationalökonomie und Statistik*, 3rd ser., vol. lxxiv (1928) 747-60.

PESCHEL, OSKAR (1826-75), German geographer. Peschel, who was trained as a jurist, served as newspaper editor in Augsburg from 1848 to 1854 and as editor of the *Ausland* from 1854 to 1871. He was a brilliant publicist, contributing many political and economic essays distinguished by their clarity, their liberal viewpoint and their insight into historical processes. As a commentator on world events Peschel became increasingly absorbed in geographic studies, and in 1871 he relinquished his editorial chair to become professor of geography at the University of Leipsic. His first book, *Geschichte des Zeitalters der Entdeckungen* (Stuttgart 1858, 2nd ed. 1877), revealed his views on the interrelation of economic principles, geographic backgrounds and historical events, and expressed most of the ideas now current regarding the bearing of oriental trade on the progress of discovery. He was then commissioned by the king of Bavaria to write *Geschichte der Erdkunde* (Munich 1865, 2nd ed. 1877); in executing this task he formulated the definition of the objectives and methods of geography which later found expression in his principal work, *Neue Probleme der vergleichenden Erdkunde* (Leipsic 1870, 4th ed. 1883). During his academic career

Peschel wrote his well known *Völkerkunde* (Leipsic 1874, 6th ed. by A. Kirchhoff, 1885; tr. as *The Races of Man*, London 1876), which discusses general anthropology with emphasis on the geographic distribution of cultural forms. Posthumous publications, compiled from his notes, indicate the wide range of interests to which he was devoting his attention at the time of his premature death (*Abhandlungen zur Erd- und Völkerkunde*, 3 vols., Leipsic 1877-79).

Peschel initiated modern academic geography by disposing through vigorous polemic of the historical philosophic orientation of Ritter and by introducing the morphologic viewpoint. The half century of Ritter's dominance had resulted in many textbooks but in little productive scholarship. Peschel pointed out a field of investigation and blocked out many problems for study. By their originality, order and comprehensiveness his lectures and books became programs of inquiry which students still consult. In Germany there sprang up after him a generation of important investigators and teachers, all of whom were indebted to him as their master. The major tradition of modern geography runs in uninterrupted line from Peschel by way of Ferdinand von Richthofen to the currently dominant school of continental geographers.

CARL SAUER

PESHEKHONOV, ALEXEY VASILYEVICH (1867-1933), Russian statistician and publicist. Peshekhonov, the son of a poor village priest, turned from school teaching to zemstvo statistics. His memorable contribution was the study of 1113 peasant households of the Kozel district in the province of Kaluga (in *Statisticheskoe opisaniye kaluzhskoy guverni*, vol. i, Kaluga 1898). It was one of the first of its kind to approach the peasant household as a production unit rather than as an aggregation of consumers; and it avoided the misleading practice then common of lumping together all peasant households without regard to the employment of outside labor or the hiring out of family members. A methodological innovation, previously unknown even outside Russia, was the study of a sample sufficiently large to give the conclusions a statistical character and yet entailing much less effort and expense than an exhaustive study. Peshekhonov's formal connection with statistics was terminated by the government, which eventually forbade him zemstvo employment; but he maintained his interest in zemstvo statistics as a student of the

Russian agrarian problem, on which he published articles in the populist monthly *Russkoe bogatstvo* (Russian fortune), whose editorial board he joined in 1904. This collaboration gained for him not only wide popularity but also the status of spokesman for the moderate wing of the populists.

Peshekhonov held that the essential characteristic of the peasantry is a close connection between the family and the economic unit, and that therefore the typical peasant household tends to be of such a size as to allow for a balance between the labor power of the family and its consumption requirements on the one hand and production capacity on the other. From the available statistics he concluded that the maintenance of this balance was endangered by the existence of large landed estates, which interfered with the extension of peasant farming, and by the exploitation of the peasantry, which made impossible the accumulation of surpluses and the intensification of peasant agriculture. The peasant economy is in a state of decay and the peasant is essentially a proletarian rather than a proprietor-cultivator; thus he has common interests with the city worker, himself but a former peasant rooted in the village and the land. To improve the condition of the laboring masses a radical reform of existing class relations is necessary; the most important single measure should be land nationalization—acquisition of the land by the state for a moderate compensation and distribution on a lease basis for cultivation by family units.

This was the chief plank in the agrarian program of the People's Socialist party, formed in 1906 with Peshekhonov's active participation by a small group of intellectuals who split from the main body of populists in the Socialist Revolutionary party. The new party was more realistic in its approach to the land question and wished to avoid overt revolutionary action, such as terroristic attempts or peasant riots, in order to facilitate organization of the masses. Although it did not succeed in attracting a wide following, its influence was considerable partly because the Laborite group in the Second Duma adopted its agrarian platform. In 1917, when Kerensky headed the Provisional Government, Peshekhonov was appointed minister of food and supplies. He remained in Russia under the Soviet regime as a statistical expert until 1922, when with a number of other intellectuals he was exiled abroad. Among the émigrés he was one of the leading advocates of

repatriation, urging them to return to their native country. Although he was given the post of economic adviser to the Soviet trade agency in Riga, he was not allowed to resume residence in Russia.

S. PROCOPOVICZ

PESSIMISM. See PROGRESS.

PESSINA, ENRICO (1828–1916), Italian jurist and statesman. Pessina educated three generations of jurists, first as professor of constitutional law at the University of Bologna and then as professor of penal law and procedure at the University of Naples. As a patriot in the revolutionary period of 1848 he experienced exile and confinement. His subsequent political activities included prolonged service as deputy, as senator and as minister of agriculture, of justice and of state. He worked with Zanardelli on the Penal Code of 1889 and inspired legislative reforms which were of great importance in helping to guarantee the autonomy of the judicial function.

Together with Giovanni Carmignani and Francesco Carrara, Pessina carried the classical school of criminal law to its peak. But he did not look upon law as a purely formal and rigidly mechanical affair; rather it was intimately connected with a wide philosophical conception based on the idea of the absolute which is embodied in human conscience, and through which man transforms the physical world into a moral one and unites himself with God. It was in accordance with this wider philosophic view as well as with his religious belief in expiation as a means of redemption that Pessina advocated the theory of retributive justice. For he believed that this would make it possible for human society to achieve a legal order as an integral part of the moral life and to reaffirm the law even when it is denied in practise.

Nevertheless, his familiarity with the natural sciences led Pessina ultimately, if not to lose faith in the principle of free will, at least to recognize that human actions cannot be purely contingent, indeterminate and entirely unmotivated. He began to realize that human liberty is restricted by the influences of the past and the forces of environment. This realization signified a transition to the naturalistic conception of crime as maintained by the positivistic school. And it was this realistic view of justice that enabled him to advocate such reforms as probation and the abolition of the death penalty,

measures which seem to invalidate Carrara's mathematical construction of law.

PESTALOZZI, JOHANN HEINRICH (1746-1827), Swiss educational reformer. Pestalozzi was born in Zurich and educated in the local Latin schools and the university, where he pursued a course in theology. During his college days he came under the spell of the powerful liberal forces which were sweeping Europe at the time, and he very early manifested an interest in reforms directed at improving the lot of the common people. Although in his social philosophy he owed a great deal to the writings of Rousseau, other intellectual tendencies influenced him, notably Pietism and romanticism. His chief affiliation with the idealism of the late eighteenth century appears in his acceptance of a concept of individual development and self-realization as the core of the educative process.

His failure as a preacher led him to take up the practise of law as a means of furthering his interest in social reform. Finding the law and politics equally unsatisfactory he turned for a livelihood to farming on an estate near Zurich, which he called Neuhof. It was here during the winter of 1774-75 that he undertook his first educational experiment—the care and training of a small group of neglected and in some cases delinquent children of the neighborhood. He depended upon daily industry, plain but wholesome living and an affectionate home atmosphere to reclaim the waifs whom he had gathered together. Educationally the venture was a success, representing as it did the beginning of reform in the treatment of neglected

and delinquent children. Financially, however, the school failed and Pestalozzi was obliged to discontinue it in 1779.

For the next nineteen years he derived his extremely slender subsistence from literary work. His first effort was a series of aphorisms on life and education under the title "Abendstunde eines Einsiedlers," appearing in May, 1780, in *Ephemeriden der Menschheit*, edited by his friend Iselin (tr. in *Pestalozzi and Pestalozzianism*, ed. by H. Barnard, New York 1859, pt. ii, p. 155-65). Foremost in the output of this period, however, was his novel, *Lienhard und Gertrud* (4 vols., Berlin and Frankfurt 1781-87; abridged translation by E. Channing, Boston 1885), which reflects his deep sympathy with the working classes and unfolds his program for their ultimate regeneration. It was through this work that Pestalozzi became widely known for his advocacy of education as the means of social improvement.

Pestalozzi returned to the field of practical education in 1798-99, when for five months he conducted an orphanage at Stans. In 1799 he was offered a teaching post in Burgdorf where his efforts resulted in the founding of the Erziehungsanstalt, an educational institute for the children of the middle classes. In 1805 this educational experiment was transferred to Yverdon, and there Pestalozzi and his helpers worked for nearly twenty years. Both at Burgdorf and at Yverdon Pestalozzi's methods aroused great interest and attracted visitors from all parts of Europe and from America, among them Robert Owen, Madame de Staël, Karl Ritter, Herbart and Fröbel. The Prussian government sent official observers who were later instrumental in introducing Pestalozzian ideas into the German folk schools. In 1825 Pestalozzi retired to Neu Hof, where he devoted himself to writing. *Schwanengesang* (written 1811-15) was his last important work.

Unfortunately Pestalozzi failed to systematize his ideas or his method. *Wie Gertrud ihre Kinder lehrt* (Zurich 1801; tr. by L. E. Holland and F. C. Turner, 5th ed. London 1915) is a partial exposition of his educational doctrine, the salient feature of which was his insistence upon direct experiences for the child instead of verbal symbols. Things were to come before words. This procedure greatly changed methods of teaching language and arithmetic and led to the introduction of new subjects, such as drawing and geography, in the common school curriculum. Neither Pestalozzi's

performance nor that of his imitators, however, entirely fulfilled its promise and as a result formalism crept into the system, a tendency which was accentuated by Pestalozzi's effort to organize instruction in carefully graded steps, each preparing the way for the one logically following. Perhaps a more lasting effect of Pestalozzi's teaching was the elimination of repressive discipline and cruel and degrading forms of punishment from the common schools. Modern elementary education in the western world rests largely upon Pestalozzian principles; and in the formulation of these principles through the medium of his writing, rather than his services as teacher and organizer, lay his greatest contribution to educational reform.

PESTEL, PAVEL IVANOVICH (1793-1826), an outstanding figure in the group responsible for the Russian Decembrist insurrection of 1825. Pestel, the son of the governor general of Siberia, served in the Russian wars against Napoleon and was later attached to the headquarters of the second army in south Russia. In 1816 he joined the first secret Society of the True and Loyal Sons of the Fatherland (also known as the Union of Salvation) and soon became leader of its radical wing. He occupied the same position in the Union of Welfare, founded in 1818, which substituted peaceful propaganda and political education for revolutionary schemes; this society had a larger membership than its predecessor, but its majority consisted, as did that of the other secret societies, of high army officers and titled aristocrats. For the next three years Pestel tried personally to influence the moderates in St. Petersburg. This attempt, however, succeeded only in bringing about the formal dissolution of the

union, which Pestel did not recognize; he continued the southern branch as a separate Southern Society to counterbalance the conservative northerners. After attempting in vain to incite the Northern Society to revolutionary action in the following two years Pestel lost some of his zeal for immediate uprising. An unsuccessful military insurrection was launched in St. Petersburg on December 14 (26), 1825, on the occasion of the accession of Nicholas I; another insurrection led by the affiliated Society of United Slavs was begun in the south a fortnight later, but it also failed lamentably. Pestel was arrested on December 13; considered by the government as the arch-revolutionary, he was sentenced to death.

The clearest expression of Pestel's views is to be found in an unfinished pamphlet, *Russkaya pravda* (Russian justice), which was intended as a guide for the future provisional government. While Nikita Muraviev, spokesman for the northern moderates, urged for Russia a constitutional monarchy on a federal basis similar to the American, Pestel advocated a republic, strongly centralized and unified. For the transitional period he proposed a military dictatorship, while Muraviev looked to a regular constitutional regime to be introduced legally by a constituent assembly. Pestel, believing that perfect political equality must be the basis of democracy, sought to introduce universal suffrage. Muraviev, on the contrary, strove to preserve the landed aristocracy and to limit suffrage to the rich. While the latter reluctantly consented to the emancipation of peasants with a small land allotment, Pestel planned the transfer of half of the arable area to the peasantry and the other half to a state reserve, from which land could be leased by entrepreneur farmers. The memory of Pestel's imposing personality and of the Decembrist group as a whole has become part of the Russian oppositionist and revolutionary tradition and is now shared both by émigrés and the ruling group in the Soviet Union.

PETER I (Peter the Great) (1672-1725), emperor of Russia. Peter is known as the "great reformer" who Europeanized Russia by harsh and violent means. This policy split Russian opinion into two camps: the Westerners, who thought Peter's Europeanization performed a great service for Russian civilization; and the Slavophiles, who censured it as the greatest crime against Russian national individuality. More sober investigations, however, have led to the view that before his time the foundations had been laid for Peter's reforms, that they represented a logical step in Russia's development and that they were thus necessary and historically inevitable, regardless of the force of Peter's own personality. A better understanding of the distinctions between the personal and incidental elements in Peter's reforms and those which were deeply implanted in Russian historical development can be derived from a study of Peter's personal story. In his early youth, which he was compelled to pass in the country, he made a hobby of the study of military and naval science. This knowledge he perfected on his journey to the wharfs of Holland and Great Britain in 1697-98 and gave it practical application in a series of wars whose object was dictated by national aims. He failed to achieve satisfactory results in the wars against Turkey of 1700 and 1711; but as an outcome of the long Northern War (1700-21) he annexed the shores of the Baltic. Here in the midst of the Finnish moors was built his new capital, St. Petersburg (1703), and he succeeded in

opening Russia to Europe. This accomplishment was exceedingly costly as regards both men and financial resources. Ancient institutions were completely destroyed and the population was reduced, probably by about 20 percent. After his second journey to France (1717) Peter found it necessary to build an entirely new system of central and local institutions, borrowed from Sweden; these met with only partial success. He was compelled moreover to seek new sources of income; to this end he introduced foreign methods into industry and imposed new taxes on the population, whose number was fixed by the first census ("Revision" of 1720).

The Russian people reacted not so much to these institutional reforms, although there were some rebellions in the southeastern provinces, as to the external changes in Russian dress and social habits introduced immediately after Peter's return from his first travels abroad. The camp of "old believers," who looked upon the reforms as conflicting with old religion, was greatly strengthened by these developments. Peter's educational reforms consisted in the establishment of the very imperfect system of professional secondary and to some extent primary schools. Hampered by lack of teachers and by the opposition of the population, Peter's educational improvements were successful only in part although they paved the way for further advances by his successors. Peter introduced also a reform in the church administration in his substitution, on the Protestant pattern, of a synod for the patriarch. He never aimed at social reform; but the creation of a standing army helped to transform the ancient "men of service" into a nobility, while the peasants of the estates were debased to the state of serfdom. Peter completely disrupted the former social categories, replacing them by a new scale of "ranks" which were to correspond to the posts in the state service. He tried also to take over European forms of municipal institutions, an attempt which led to nothing more than changes in names.

PETER OF ANDLO. *See* ANDLO, PETER OF.

PETER LOMBARD (c. 1100–60/64), Italian teacher and theologian. Peter Lombard, a native of Novara, studied at Bologna, Reims and Paris. He was bishop of Paris from 1159 to 1160. He was the author of commentaries on the *Psalms* and the epistles of Paul and of some sermons, but is remembered chiefly for the *Libri IV sententiarum* (finished about 1150; best modern edition, 2 vols., Quarachi 1916), from which he was known as the “Master of the Sentences.” His importance lies not in any doctrine that may be attributed to him, but rather in his method and materials, which he used in common with the numerous canon lawyers and theologians of the twelfth century. Peter Abélard, Hugh of Saint-Victor and Gratian were among the earlier workers from whom Lombard borrowed information and solutions. The method, from which the so-called scholastic method evolved, consisted in collating a variety of Scriptural and patristic quotations (the Sentences) relevant to a succession of questions, and, when the citations were in apparent disagreement, in resolving the contradiction dialectically. The Sentences constitute a systematic organization of the whole field of theology, including the more general problems of canon law, as well as a comprehensive collection of the principal “texts” of the subject. During the thirteenth century the study of Lombard’s Sentences became the fundamental course in the faculties of theology. Most of the great medieval philosophers, among them Bonaventura, Aquinas, Duns Scotus and William of Ockham, left commentaries on the work, and in these commentaries are to be found the beginnings of many important ethical, political and economic doctrines; thus Aquinas in his commentary gives the first statement of his doctrines on perjury and the nature of law and the foundations of his theory of usury. When the humanists and reformers in the fifteenth and sixteenth centuries censured the methods of scholasticism, it was not unusual for them to direct their criticisms specifically against the dialectic of

the sententiaries, or commentators on the Sentences.

PETERS, CARL (1856–1918), German colonial administrator. Intellectually gifted and strong willed to the point of recklessness, Peters contributed a dynamic force to German colonial history. Deflected from an academic career by a long stay in England, where he became enthusiastically interested in imperialism, he returned to organize the Gesellschaft für Deutsche Colonisation in 1884 as a protest against the inaction of the Kolonialverein. He then explored independently the districts of Useghu, Ukami, Nguru and Usagara in east Africa. His energetic action helped precipitate the German colonial movement from an idea into a glorious reality and added about 60,000 square miles to the newborn colonial empire.

Peters’ subsequent expeditions into Uganda on his adventurous search for Emin Pasha, into Wituland and along the Nile materially increased German holdings and prestige; but they also brought his country into conflict with the aims and claims of other powers, especially Great Britain. The result influenced Bismarck to place the colonies under direct imperial control, which effected Germany’s entrance into international, imperialistic competition.

Appointed imperial commissioner, Peters was accused by political enemies, chiefly socialists, of atrocious cruelty toward natives. He was dismissed from service in 1894 and retired to England. He remained permanently withdrawn from German affairs but in 1906 he was reinvested with his title. The “Peters’ scandal,” illustrating the constant and significant connection between Germany’s expansion and its party politics, indicates that Peters left an indelible impress upon both the external and the internal history of the German colonial movement.

PETITION, RIGHT OF. The history of the right of petition in England is bound up with the development of the separate legislative, judicial and administrative organs and procedure of the state. From the right of petition have developed the procedure on public and private bills, the equity jurisdiction of the chancellor and the peculiarities of the procedure against the crown by petition of right. As the functions of the courts, the Chancery, the Council and Parliament were separated and defined, there was left a residual right of the subject to appeal to the king or to Parliament, which in the seventeenth century was recognized by the judges as the "birthright of the subject" and in the eighteenth century as inseparable from civilized government.

The right to petition the king as the source of justice was admitted at least as early as Magna Carta, when John promised that he would not deny or postpone justice to anyone. Barons and Commons in their earliest meetings asserted the right of initiative in the form of petitions. The ordinary mode of legislation was by statute made on petition of the Commons. The words petition and bill were used interchangeably in legal and common speech down to Tudor times (McIlwain, C. H., *High Court of Parliament*, p. 211). The procedure by petition was flexible enough to deal with the intermittent functions of mediaeval parliaments. The king summoned a parliament partly for advice but mainly for supply, and was petitioned for a redress of grievances in return for meeting his financial needs. But as parliaments grew in importance in the fifteenth century they were not satisfied to make grants after receiving a favorable reply to their petitions but claimed to dictate the form of reply themselves. By so doing they prevented the equivocation and evasion of the king in Council. In 1414 the Commons declared themselves to be "as well assentirs as petitioners." The king answered: "The King of his grace especial graunteth that fro hens forth no thyng be enacted to the Peticions of his Commune, that be contrarie of hir askyng, wharby they shuld be bounde withoute their assent." In the fourteenth century legislation was "at the request of the Commons"; in the fifteenth it was "by authority" of the same.

In the thirteenth and fourteenth centuries the distinction between the work of the king in Council and the king in Parliament was not clearly drawn. There was no sharp line between the petitions of the assembled Lords and Commons and the general mass of suitors. The latter wanted to get by peaceable means something not obtainable in the ordinary procedure of the law. They addressed their petitions not to Parliament but to the king in Council. For Parliament was then, as Maitland puts it, "rather an act than a body of persons. One cannot present a petition to a colloquy, to a debate." The petitions were of various kinds. They came from individuals and from communities. If they could be satisfied in the ordinary courts of law they were referred to the appropriate court. If they asked relief which no known writ could give, or a favor of the king or even new legislation, their petition was considered by the king in Council, in which was concentrated for the time all the powers of the state. The king was to devise remedies for new wrongs and to distribute justice according to each man's deserts. In the fourteenth century the House of Commons attempted to secure that all petitions involving a change of law should be determined by themselves. Receivers and triers of petitions were appointed by the king from among the Lords of Parliament—a practise which lingered until 1886 in the procedure of the House of Lords. Gradually, however, the High Court of Parliament ceased to be the resort of suitors who desired a remedy for individual grievances. Instead from the time of Henry IV they addressed themselves to the Commons, both houses of Parliament or the king in Council for *privilegium*, or change of law for their benefit; and from these proceedings modern private bill procedure has developed.

In the sixteenth and seventeenth centuries there appeared public petitions for a change in the general law. A Committee of Grievances, to which petitions were referred, was appointed by the House of Commons in 1571. In 1640 there is the entry in the Commons *Journal*: "These [members] are added to the Committee for sorting of Petitions, and are specially to consider of, and to sort such Petitions as concern the Publick" (House of Commons, *Journal, 1640-1642*, vol. ii, 1803, p. 61). In the seventeenth century the organization of petitions became a method of propaganda, and some of the most fundamental political ideas of the Commonwealth period are to be found in them. The

Petition of Right (1628) was a peculiar and special case. The Commons was determined to deal with illegal taxation, arbitrary imprisonment, billeting of soldiers on individuals and punishment by martial law. A simple confirmation of the existing law by the king would leave him free to continue his own interpretation; he would never agree to a change in the law. Therefore a Petition of Right was resorted to as being a declaratory act by the High Court of Parliament, which in the opinion of the Commons would be binding on the courts. Petitions of right from individuals were common but a petition for a judicial remedy drawn up by both houses of Parliament was very unusual. Technically the Petition of Right was not a statute but a judicial decision. The form of assent given by the king was that given to a private bill: "Soit droit fait come est desire." It secured a striking statement of the supremacy of the law, which, however, had yet to be implemented by civil war.

If the petition of right may be regarded as effective propaganda by learned and propertied lawyers in the language they best understood, wider demands were to be heard in simpler words in the period of revolution. Parliament approved the petitions of its supporters and snubbed or imprisoned petitioners of whom it disapproved. In 1641 a petition was signed by 15,000 Londoners and rolled into Westminster Hall by 1500 persons. In 1643 "a great multitude of the wives of substantial citizens came to the House of Commons with a petition for peace . . . a troop of horse . . . charged among the silly women and killed and wounded many of them, and easily dispersed the rest" (Clarendon). In 1647 a Lilburnian petition of the kind Clarendon found "horrible" was presented to the House of Commons; it addressed the House as the supreme authority of the nation, presenting a program which Gardiner says menaced the habits and interests of thousands who belonged to the influential classes. The lawyers, the clergy and the city were all opposed to it and it was burned by the common hangman.

As the habit of propaganda by petition spread, it was found necessary to restrict tumultuous petitioning on matters of public policy. This was done by statute (13 Car. 11, St. 1, c. 5), but its provisions were not seriously enforced. They stipulated that no petition to the king or either house of Parliament for an alteration in church or state should be signed by more than twenty

persons without the approval of three justices of the peace or the majority of a grand jury; nor should any petition be presented by more than ten persons at a time. In 1669 the House of Commons resolved: "That it is the inherent right of every commoner in England to prepare and present Petitions to the House of Commons in case of grievance, and the House of Commons to receive the same"; "That it is an undoubted right and privilege of the Commons to judge and determine concerning the nature and matter of such petitions, how far they are fit or unfit to be received." In 1680 the "Petitioners" to the king to summon Parliament and the "Abhorrrers" of such interference with the royal prerogative supplied the first party names in something of the modern vein.

The right of popular petition seemed a natural liberty to Clarendon, as it did to more than one of the judges in the Seven Bishops Case (State Trials XII, p. 183, 407). The Bill of Rights asserted that "it is the right of the subjects to petition the King, and all commitments and prosecutions for such petitioning are illegal." But king and Parliament did not hesitate to show their disapproval of petitions that touched their privileges. In 1701 the House of Commons voted that a petition of the grand jury of Kent that they should turn their loyal addresses into bills of supply was "scandalous, insolent, and seditious." Doubtless the petition and others modeled on it were part of an organized Whig propaganda. In 1769 Dr. Johnson remarked: "This petitioning is a new mode of distressing government, and a mighty easy one. I will undertake to get petitions either against quarter guineas or half guineas, with the help of a little hot wine." In the same year a petition to the king by the supporters of Wilkes was received in contemptuous silence. But in 1782 the first petition against the slave trade was helped by something more than hot wine. The habit of organized petitioning grew steadily. Petitions were a method by which the unfranchised could take part in politics. In 1795 when Pitt introduced his bill to repress seditious meetings he disclaimed expressly any intention of interfering with the right of petition. In 1812 Brougham secured the revocation of the Orders in Council by organizing petitions on a large scale. In the unreformed Parliament there were occasionally great debates on petitions. Petitions played their part in the passage of the Reform Bill itself. As in the eighteenth century they were organized and not spontaneous. Croker said that in 1821 nine-

teen petitions were presented for reform, in 1822 twelve, in 1823 twenty-nine, from 1824 to 1829 none and in 1830 only fourteen; "then came the dissolution; the Whigs organised a clamour in the country; 650 petitions have been the result of that appeal" (Butler, J. R. M., *The Passing of the Great Reform Bill*, p. 200).

With the passing of the Reform Bill petitions became a plague. Whereas in the five years ending in 1790 there had been 800, in the five years ending in 1847 there were over 80,000. Every petition had to be presented to the House of Commons by a member and the procedure permitted four regular motions for each separate petition with the possibility of debate on each motion. So severe were their inroads on the time of the House that in 1833 a Select Committee was appointed to which were referred all petitions except those relating to private bills, with instructions to classify, abstract and report. In 1839 debate was forbidden. In 1842 and 1853 the House by standing orders limited the procedure to a statement by the member presenting the petition as to the parties from which it came, the number of signatures, the material allegations and the prayer with which it concluded. The present procedure is substantially the same. (For details, see May, T. E., *Parliamentary Practise*, ch. xxii.)

The right of petition involves the right of private persons to meet for the joint preparation and signature of the statement of their grievances and their right to meet to decide the time of presentation. The right of petition merges thus into the right of assembly and the right of association for the protection of interests. The most picturesque exercise of this right in England was in the Chartist petitions of 1839, 1842 and 1848. The first was a document drawn up by R. K. Douglas and brought forward at Chartist meetings all over the country, until it became a "beautiful and majestic roll" (*Northern Star*, May 11, 1839) three miles long with 1,200,000 signatures. An alarmed House of Commons rejected it five to one. The petition of 1842 achieved six miles of length and had to be broken into lumps and bundles before it could enter the House. It too was rejected five to one. That of 1848—a poor thing of O'Connor's own—was a fiasco; its procession was abandoned and its alleged 6,000,000 signatures were found to be fewer than 2,000,000. For the rest of the century petition played some part in the political life of the country. Lost causes, strange faiths and new thoughts all used it for its publicity

value. In the period 1833–37 there were 5000 petitions for the better observance of the Lord's Day; in 1850 nearly 5000 against Sunday labor in the post office; in 1856, 5000 against the opening of the British Museum on Sundays. In 1848 there were 577 petitions for universal suffrage with 2,000,000 signatures. In the five years ending in 1872 there were 101,500, but after that the number declined steadily and in the five years ending in 1922 there were only 245. The extension of the suffrage, the development of the press, the increased use of questions in the House and the greater competence of the police in the management of processions has robbed petitions of their power to threaten or persuade.

The right of petition was regarded in the eighteenth century both in England and in America as a natural right which despotism itself could hardly stoop to withhold. It was a common law tradition in the colonies. The Declaration of Rights of the Stamp Act Congress of 1765 declared "That it is the right of the British subjects in these colonies, to petition the King or either house of parliament." "In every stage of these Oppressions," says the Declaration of Independence, "We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered by repeated injury." The right to assemble and petition is found in most of the longer bills of rights of the revolting colonies. It was included in the First Amendment to the federal constitution. Even when not specifically stated it was still thought to be implied in the very nature of republican government. Story expresses this view in his comments on the First Amendment, and in *United States v. Cruikshank et al* [92 U. S. 542 (1875)] the court handed down a similar interpretation. Nevertheless, at times of passion or of danger it has of course been denied in practise. In 1836 the defenders of slavery were irritated by a constant stream of petitions against it. A special committee recommended that since discussion of the topic was disquieting, all petitions regarding it should be laid on the table without publication, notice or action. This seemed to John Quincy Adams a gag on the constitutional rights of free men, and until it was withdrawn in 1845 he fought the recommendation, maintaining that not even "the most abject despotism" would "deprive the citizen of the right to supplicate for a boon, or to pray for mercy." In war time petitions for the repeal of the espionage and sedition laws or against

military measures for recruiting have resulted in imprisonment [United States v. Baltzer, *Report of the Attorney General* (1918) p. 48]. Processions for the presentation of petitions have often led in the United States to the same tragi-comic denouements as in Chartist England. In 1894 armies of unemployed were organized by General Coxey of Ohio to march on Washington and present a "petition in boots," only to see their leaders arrested for unlawfully walking on the grass of the capitol. A somewhat similar march on Washington by unemployed veterans in 1932 to dramatize their plight and apply pressure upon Congress for bonus legislation was also defended as an exercise of the right of petition. The Hoover administration, however, regarded it as a threat against the constitution and called out the army to expel the bonus marchers and burn their camps. Except as an actual prelude to revolution the attempt to overawe a legislature by physical force can have little use either for propaganda or persuasion.

On the continent the right of petition was in many states traditional. It received a new significance from the French Revolution. While not specifically mentioned in the Declaration of the Rights of Man it was implicit in the whole theory of republican government. At the beginning of the French Revolution petitions were presented in pompous terms in the name of Reason, Virtue, Liberty, Humanity. The French constitution of 1791 suffered severely from the pernicious influence of petitions presented by individuals, soldiers and localities, often with the assistance of armed mobs. But as twenty years before the French Revolution every enlightened Frenchman had read the text of American constitutions, so that part of the political vocabulary of the revolution in France was American (Aulard, A., *Histoire politique de la Révolution française*, Paris 1901; tr. by B. Miall, 4 vols., London 1910, vol. i, p. 113), it is not surprising that the specific right of petition appeared in the declaration prefixed to the constitution of 1793. It is to be found also in article 21 of the Belgian constitution of 1831. In the revolutionary movement of 1848 Dahlmann's address to the Prussian government was signed by nearly the whole professoriat of Bonn. There was almost a universal claim for freedom of the press, the right of free assembly and petition and a national parliament. Throughout the Revolution of 1848 the procedure was nearly always the same—mass meetings with "storm petitions" to

the sovereign or to the diet. The use of petitions as a preliminary to riots and revolution led to limitations of the right of petition, such as that of the law of July 22–23, 1879, in France (art. 7). The right of petition is found in the new post-war constitutions of Europe. The Weimar constitution (art. 126) made provision for it. But, as the subsequent downfall of parliamentary government in Germany has proved, such rights have little meaning save as incidental safeguards to an already healthy representative government.

PETRARCH, FRANCESCO (1304-74), Italian poet and humanist. Petrarch's name is associated in the history of literature chiefly with his *Canzoniere*, or collection of lyrics, in which he celebrated and idealized his love for Madonna Laura. But his rich and colorful personality left a lasting imprint also upon the wider field of social and cultural relations. He is one of the most outstanding representatives of that new type of man which began to emerge out of the mediaeval world under a decidedly modern banner. Discarding the attitude which treated classical antiquity as merely an accumulation of religious and philosophic dogmas, something to be appropriated by an impersonal study, Petrarch was one of the first to turn directly to the original sources, attempting to reconstruct them philologically and to appreciate the purity of a content freed from conventional interpretations.

The example of Petrarch was to yield rich fruit in the fifteenth century, inspiring scholars with an absorbing passion for the monuments of classical literature and giving rise to that historical movement which is usually designated as humanism. This interest in antiquity, however, transcended the confines of literature, for it was accompanied by a new sentiment for the secular elements in human life as expressed in a love of glory, a desire for self-affirmation and self-expression, a restless quest for originality and a curiosity about new things. The new tendencies did not of course exclude imitations of classical models, imitations which often bordered on servility. As a matter of fact the recent/ emerged personalities found a source of both moderation and strength in their contact with the individualities of the great classics, whose true significance had scarcely begun to be appreciated. Thus the work of Petrarch represents a mixture of imitations, motives and attitudes expressive of the life of his time and displaying original features under the cloak of Cicero and Livy. The new traits are conspicuous above all in Petrarch's rich correspondence, which reveals the variety of interests and intricacy of relationships so characteristic of the nascent humanistic culture. Like those of Cicero, Petrarch's letters were written with a view to publication and were intended for wide, educated audiences. In this way they contributed to the crystallization of a public literary opinion, determined no longer by the religious and the academic but by laymen, a development which went far in emancipating culture from the trammels of tradition. Likewise of great im-

portance as signs of a new realistic and secular attitude are the autobiographical references scattered throughout Petrarch's writings, particularly in the *Epistola ad posteros* and in the polemical *De sui ipsius et multorum ignorantia*.

Petrarch's philosophical writings too give evidence of a conscious detachment from the past, which to be sure does not go beyond a strong aversion to the confused learning of the schoolmen. Against the prevailing Averroistic interpretations of Aristotelianism, which were very popular among the scholars of the University of Padua, Petrarch vindicated the cause of Plato, thus preparing the ground for studies which in the fifteenth century culminated in the Florentine Academy of Marsilio Ficino. His meager knowledge of Greek prevented Petrarch from deriving proper benefit from the new cultural orientation. The Platonic philosophy was accessible to him only through the interpretation of St. Augustine, whom he admired both as a person and as an exponent of his own Christian sentiments. The philosophic dialogues—*De vita solitaria*, *De vera sapientia*, *De contemptu mundi*—betray Augustinian motives, stressing the separation of the sacred from the profane and evaluating the latter from a skeptic and pessimistic point of view. Certainly there is an obvious opposition between the skeptical tendencies of these writings and the new humanistic attitude. But Petrarch was not a systematic and rigorous thinker; hence his frequent oscillations between an admiration for the classics and a contempt for secular knowledge. It must be pointed out furthermore that his religious strictness became more intense in the last period of his life and that he even went so far as to regard as youthful lapses those products of his literary and humanistic activity upon which his most lasting fame rests.

The political ideas of Petrarch do not equal in precision and clarity those of his older contemporary, Dante Alighieri. They are interesting, however, as signs of the new age. The papacy and the mediaeval empire, which for Dante were the highest expression of political life, Petrarch held to be of but secondary importance as guiding forces of humanity. Great changes had occurred in Christianity during the few decades which separated the literary activity of Dante and Petrarch: the papacy, severely hit by the French monarchy, had moved to Avignon in the so-called Babylonish captivity, and the empire had proved its inability to govern an Italy split up into minute constellations of com-

munities and principalities. Petrarch was deeply sensitive to the decadence of the two great powers of Christianity. Although occasionally he entreated them passionately to restore Italy's peace and unity, he pinned his greatest hopes on an awakening of secular forces, which he imagined after the pattern of Brutus and Scipio, the founders of the republican grandeur of ancient Rome. He extolled the images of the ancient heroes in the Latin poem *Africa*, in which he described the Second Punic War, and in an incomplete work, *De viris illustribus*, which was intended as a sort of biographical history of Rome. The brief emergence in Rome of Cola di Rienzi, who was animated by the generous but visionary ideal of restoring the ancient glory of Italy, Petrarch hailed in the famous song, *Spirto gentil che quelle membra reggi*, as a reincarnation of the classic spirit.

Petrarch's political ideas exhibit in general a tendency to fuse the history of ancient Rome with that of modern Italy and to extol the political unity of the latter by appealing to the tradition of the past as well as to the affinities of race, language and customs. These motives have played an important part in the formation of an Italian national sentiment. They have led to the creation of what might be called "the cultural nation," which became the necessary condition for the existence of the political nation. But the fact that this ideal of a cultural nation assumed a merely literary and too often an academic character has at times given rise to disproportionate ambitions, fallacious illusions and bitter disappointments.

PETRAZHITSKY, LEV IOSIFOVICH (Petrążycki, Leon) (1867–1931), Russian jurist. Petrazhitzky was professor at St. Petersburg before the revolution and after 1918 at Warsaw. He was the greatest legal philosopher of both countries. In his first civilistic works, written in German and containing vigorous criticism of the project for a German civil code, he opposed to the individualism and egoism of the Roman law which inspired its authors "the gospel of love applied to the juridical sphere." His thesis of the impossibility of separating completely justice and charity led him ultimately to revise the traditional theories of the relation of law and morals but first to create a separate juridical discipline, "the politics of law," as a substitute for the old theory of natural law. Founded partly upon a positive knowledge of human psychology and partly upon idealism, the politics of law was to point the way to an everlasting reconciliation of law with the ideal of love.

In his fundamental works, written in Russian, Petrazhitzky developed a theory of law based upon an "emotional" psychology. Law can be understood only as a subjective psychological experience. It is an "emotion" which as a psychic phenomenon is distinct from cognition, feeling and will, for it is simultaneously active and passive. Not the pleasures or rational purposes but the moral and juridical emotions are the guides of human conduct. They are the reactions, directly appulsive and repulsive, which are provoked by ideas of certain patterns of actions. Thus in contradistinction to hedonistic or utilitarian motivations of conduct they are autonomous and truly normative. Moreover while the moral emotions and their immediate data have a "unilateral" and simple "imperative" character, the juridical emotions have a "bilateral," or "imperative-attributive," character; in other words, they not only impose duties but create corresponding claims. The law is in this way differentiated from morals without complete detachment from the latter, as in Kant. The moral emotion is immanent in the juridical emotion but in a more limited form. The possibility of compulsion, the tendency toward positivity, and "unification" or the resolution of social conflicts—all the characteristics of the legal order—are derived simply from the bilateral and imperative-attributive nature of the juridical emotions.

Petrzhitzky's theory was descriptive rather than explanatory and it was not entirely free

from contradiction, for it harbored positivistic as well as idealistic elements. In its "emotional intuitivism" it is related to the phenomenological philosophy of Max Scheler as well as to the psychology of the school of Franz Brentano. It helped, however, to establish the juridical pluralism which is characteristic of the present generation. In recognizing the existence of any authority as a sufficient basis for law Petrazhitzky contributed to the liberation of the notion of positive law from all necessary connection with the idea of the state. He held that there existed "unofficial," or extrastate law, which not only was frequently not derived from the state but was actually ignored by it. The sources of the positive law were indeed in principle infinite. Petrazhitzky distinguished between positive law and "intuitive" law, but the distinction was not based upon the official character of the former. Positive law was heteronomous, deriving its obligatory force from external elements, but intuitive law was autonomous. Unlike positive law it did not depend for its validity upon "normative facts." This intuitive law, which played an essential role in the life of the law, might prove to be a conservative as well as a progressive force.

PETTY, SIR WILLIAM (1623-87), English economist and statistician. Petty was the son of a poor clothier. As a lad he went to sea and through an accident was stranded in France, where by virtue of his precocity he gained admission to the Jesuit College at Caen. Subsequently he went to the Netherlands and studied at Utrecht, Amsterdam and Leyden. In Paris

he met Thomas Hobbes, from whom he learned the general principles of statecraft. Returning to England Petty occupied himself for some time with projects of mechanical inventions. His first publication was a pamphlet in which he proposed a general system of education for children over seven from which none was to be excluded because of the parents' lack of means. He was also anxious to provide for technical education and he threw out the suggestion of a learned society for the advancement of knowledge. In England Petty studied medicine at the University of Oxford and subsequently at the College of Physicians in London. When the successful parliamentary party undertook the reorganization of the University of Oxford he was elected fellow of Brasenose College and deputy and later successor to the professor of anatomy. In 1652 he was appointed physician general of the English army in Ireland, and after the Cromwellian conquest of Ireland he was charged with the task of making a survey of the forfeited estates of the Irish landowners. This survey, carried through on a large scale and in a scientific manner, will always remain one of his chief claims to fame. He was a member of the group of scientists which formed the nucleus of the Royal Society and was named a charter member of its council when it was incorporated in 1662. He was knighted in the same year.

Experience in Ireland had deepened Petty's interest in the study of society and after the Restoration he devoted much of his energy to the economic problems of government. His mind was dominated by a desire, as he puts it, to express facts "in terms of *Number, Weight and Measure*." So closely was he associated with John Graunt (*q.v.*), whose *Natural and Political Observations . . . made upon the Bills of Mortality* (London 1662) laid the foundations of the study of vital statistics, that the authorship of the work has frequently been ascribed to Petty himself. In his most important publication, *A Treatise of Taxes and Contributions* (London 1662), which established his reputation as the most significant English writer on taxation prior to Adam Smith, he discussed the principles of taxation, particularly the distribution of the tax burden. In *Verbum sapienti* (*The Political History of Ireland . . . to which is added Verbum sapienti*, London 1691) he attempted to show how national wealth may be computed. He had a clear understanding of what constitutes wealth and was almost free from the characteristic mercantilist misconcep-

tions. He recognized that there may be too much or too little money and that the demand for it will vary according to the velocity of circulation. In *Quantulumcunque* (London 1695) he dealt with the general problems of money, condemned restrictions on the export of the precious metals and suggested that limitations on the rate of interest were futile. In *Political Arithmetick* (London 1690) Petty made an interesting attempt to compare the relative economic position of various countries. Like most of his contemporaries he was deeply interested in the progress achieved by the Dutch and offered such rational explanations of their success as the factors of geographical position, density of population and economy of labor by mechanical devices. He was not much concerned with foreign trade and apparently was not acquainted with contemporary tracts on the balance of trade. Here and there in his writings he insisted that it was folly to interfere with the laws of nature and it is probable that he had little faith in the value of regulation.

While Petty's main purpose was usually practical, he frequently indulged in theoretical speculations. The most interesting was his effort to find a natural objective basis of value in which all prices may be expressed. He suggested that the source of this might be in land and labor, but he reached no very definite conclusion. The germs of many principles may be discerned in his essays: for instance, he was quite explicit on the importance of division of labor; he adumbrated the abstinence theory of interest; and while he characterized rent as a mystery, he grasped the fact that it is in part a differential charge due to relative situation. But intermittent illumination does not prove that he had a real appreciation of the connection between underlying principles.

PEUTINGER, KONRAD (1465-1547), German humanist. Peutinger was born in Augsburg. As a humanist, a friend of the arts and one familiar with the works of Roman and German antiquity this learned diplomat and political counselor of the Hapsburgs came to exercise a great influence on the artistic and literary commissions of Maximilian I, and it was in large part through him that the Renaissance penetrated into Augsburg. The spirit of the Italian Renaissance was apparent also in his important activities in connection with economic policy and social reform both in his native city and in the empire at large. Completely immersed in the world of the Roman law and its strong individualistic strain, Peutinger not only helped to formulate an economic policy for the city of Augsburg which should be cordial toward capitalism but also was influential in persuading the city to advocate such a policy at the Reichstag meetings during the sixteenth century. Descended from a merchant family and related intimately to the Welsers and Fuggers, he demanded that individual freedom in the pursuit of economic interests should become the fundamental principle for all state and municipal economic policies. It was through Peutinger's influence, second only to that of Jacob Fugger, that Augsburg espoused the most liberal economic policy of any city in Germany. Whereas other and larger cities of the empire demanded greater concessions to the middle classes and the artisans as opposed to the more powerful commercial houses, Augsburg alone supported the party of the great capitalists almost without reservation. The town council decreed that no restrictions should be placed on the expansion of the trading companies either within or without the city. No limit was to be imposed on their capital invested or on the number of their branch establishments. All the great merchants, especially Jacob Fugger, came to Peutinger for advice on the legal and canonical questions connected with their business and commercial affairs. Scarcely any other economic theoretician of the time stood out so determinedly for the freedom of the price process and for concessions to private capitalist monopolies and cartels. Peutinger's opposition to the economic ethics of the Middle Ages is clearly evident in his dictum on the question of price fixing: every merchant may sell his wares for as high a price as he desires and is able to secure. This new conception of economic policy Peutinger introduced into the laws of the empire through a series of

brilliant legal opinions and through his outlines for numerous progressive commercial laws of Charles v.

JAKOB STRIEDER

PFEIFFER, EDUARD VON (1835-1921), German cooperator. Equipped with a good theoretical training Pfeiffer traveled in England and France, studying their economic and social problems. The fruits of these studies were embodied in his *Über Genossenschaftswesen: Was ist der Arbeiterstand in der heutigen Gesellschaft? Und was kann er werden?* (Leipsic 1863). Opposed to both socialism and communism, he favored the retention of the institution of private property and maintained that the condition of the working classes could gradually be improved through cooperative self-help. Consumers' societies, he declared, would reduce the living costs of the masses and would at the same time bring about such other advantages as encouragement of cash payments. What was most important, they would train the masses in the accumulation of capital for cooperative large scale production. In accordance with these fundamental and, for his time, significant ideas he created in 1864 the Stuttgarter Konsumverein, which is still in existence. Pfeiffer prepared his handbook, *Die Consumvereine, ihr Wesen und Wirken* (Stuttgart 1865, 2nd ed. 1869), at the request of the German labor organizations. In 1867 he founded the Verband Deutscher Konsumvereine and became editor of its official organ. At the same time he began to organize cooperative large scale purchasing. The Allgemeiner Deutscher Genossenschaftsverband, founded and directed by Schulze-Delitzsch, at first assumed an unfriendly and critical attitude toward Pfeiffer's efforts, but in 1871 Pfeiffer was able to effect the fusion of his organization with the Allgemeiner Verband. Thereafter, although he continued in friendly contact with the Stuttgart society, he retired completely from the movement and devoted his attention to other social and political tasks. He was particularly active in connection with public housing projects. Pfeiffer was the clearest theoretician and

the most practical leader of the consumers' co-operative movement in Germany in its early period.

PFEIFFER, JOHANN FRIEDRICH VON (1718-87), German economist. Pfeiffer was one of the group of German economists, represented by Dohm and Sonnenfels, who opposed the physiocratic system, particularly the absolute and universal character of its principles. The rejection of this unhistorical theism, which attempted to solve all conflicts of epistemological, ethical and social nature by the concept of preordained harmony, found strong expression even in the writings of the German physiocrats, which tended to assert the organic nature of the state instead of the elements of natural rights. Pfeiffer likewise adhered to the principle of absolute government. In harmony with the ideal of enlightened absolutism which was characteristic of German cameralism, he saw in the state a positive force in the shaping and direction of the economic destinies of the country. He was, however, sufficiently influenced by Adam Smith to believe that the principle of individual self-interest should guide the state in drawing up its economic program. In the interests of a strong, unified state he advocated the abolition of internal customs duties.

Pfeiffer paid scant attention to the philosophical bases of the physiocratic system, treating it rather from the narrow viewpoint of economic and fiscal organization; and it was from this angle that he sought to refute it. He rejected the principle of the single tax, arguing that contrary to a tax on industry a tax on agricultural products is rarely shifted to the rest of society and would therefore burden agriculture unduly. Moreover a tax on agricultural products alone would not yield revenue sufficient to meet the fiscal requirements of the state. Pfeiffer's general views, the organization of his works and the technological slant of his writings link him definitely with the tradition of cameralism.

PHILANTHROPY. See CHARITY.

PHILIP II (1527-98), king of Spain. The wish of Charles V to leave all his dominions to Philip, his only legitimate son, was frustrated by the resistance of the German Hapsburgs. Nevertheless, when in 1556 Philip became ruler of Spain, the Netherlands, Naples, Sicily, Milan and the Spanish oversea possessions, he was the most powerful sovereign in the world. Moreover his marriage with Mary Tudor two years previously aroused hopes that England might be brought within the orbit of the Hapsburg interests. While Charles V was a Fleming, Philip was brought up as a Spaniard, although his political education was based in large part upon the advice and instructions of his father. It has been suggested that Philip's bureaucratic rule and his characteristic hesitation may have resulted from the nature of his father's precepts. Although he was an absolutist, Philip did not pursue a centralistic policy. When he annexed Portugal and its possessions in 1580 he displayed a scrupulous respect for its national institutions and peculiarities. As the leading partisan of the Counter-Reformation Philip made religion, dynastic considerations and the unification of the peninsula the primary factors in his policy. He did not tolerate heresy, either in Spain, where he provoked and put down a bloody rebellion of the Moriscos, or in the Netherlands. The Dutch provinces, as a result, were lost to Spain. Philip's ships battled the Turks and the English; his armies waged war against the French, who persisted in their fear of Hapsburg encroachment, and against the Protestants in the Netherlands and the Rhineland. But the destruction of the great armada near the English coast in 1588 marked a permanent setback for Spanish world domination. Nevertheless, the strongest factor in the Spanish decline lay not in military defeats but in economic causes which had their origin in part in the reign of Charles

The constant wars drained the man power as well as the wealth of the nation. The state enforced burdensome regulations upon industry and agriculture and assumed a monopoly over the American trade; the great landowners oppressed the peasantry; the shift of trade routes from the Mediterranean to the Atlantic involved a disorganization of commerce and industry in older centers, so that excessive trust was placed in the surplus of gold and silver from the colonies. Neither Philip nor his statesmen, however, were able to ward off the catastrophe.

PHILIP IV (The Fair) (1268-1314), king of France. Philip's reign of almost thirty years saw the triumph of the national state over the papacy, the first Estates General and the foundation of a permanent administrative centralization. His taxation of the clergy called forth the bull *Clericis laicos* (1296), in which Boniface VIII forbade such taxation under penalty of excommunication. Philip replied by striking at papal revenues through an embargo on the exportation of gold and silver, and Boniface was forced to yield. A few years later the quarrel broke out afresh, and Boniface announced a synod at Rome to discuss the affairs of France. French patriotic nationalism was roused by numerous pamphlets; Philip convoked the Estates General and succeeded in crystallizing public opinion in his favor. He was thereupon excommunicated. A desperate plan to kidnap Boniface and bring him to France failed. Philip made his peace with the next pope, Benedict XI, who was succeeded by the archbishop of Bordeaux as Clement V. With the latter began the Babylonish captivity of the papacy at Avignon.

Philip was heavily in debt to the Knights Templar and planned to have the order dissolved and its property entrusted to the crown. He brought pressure to bear on Clement by

accusing the deceased Boniface of heresy and insisting on a trial. To avoid this embarrassment Clement finally agreed to an investigation of the Templars. Philip and his advisers so manipulated this investigation that the order was formally suppressed; much of its property remained in the king's possession.

In the field of national administration Philip built upon the work of his predecessors. The powers and duties of bailiffs and seneschals were extended, and trained lawyers from the middle class were introduced into the royal court. An increasing number of cases were reserved for this court, and appeals from local courts were heard. The added functions of the court caused it to be separated into three divisions, the King's Council, the Chamber of Accounts and the Parlement of Paris. In financial affairs Philip showed little ability; he failed to establish an adequate system of taxation and even resorted to debasing the coinage.

PHILIP AUGUSTUS (1165-1223), member of the Capetian dynasty, king of France from 1180. The reign of Philip Augustus, a crucial period in the territorial consolidation of the French kingdom, is no less significant for the evolution of political ideas and of administrative and social institutions. The keynote of his entire program was the restoration of the royal power at the expense of feudalism. In extending his jurisdiction either as seignior or, according to the system of tenure *en pariage*, as coseignior over the territories of feudal lords, he based his claims upon the immunity of the king to the ordinary rules of feudal custom and insisted unequivocally that his position as sovereign rendered him superior to the status of vassalage. In 1209 he further strengthened his authority by introducing the rule that the division of a

fief among several heirs automatically converted those heirs into immediate vassals of the lord of the whole, who very frequently was the king himself. A different aspect of Philip's program to exalt the royal power was his destruction of the control formerly exercised by the lords over the high offices of state. Two of the most formidable offices he left vacant indefinitely, that of chancellor from 1185 and that of seneschal from 1191; the other posts of the Curia Regis he entrusted to compliant members of the bourgeoisie or clergy, thus inaugurating the reign of the "legists." In order to provide a check upon the provincial officials and to promote administrative centralization he created the office of *bailli*. At first merely representatives on mission or members of the Curia Regis serving as special emissaries and entrusted with control over the provosts, with appellate judicial functions and with the task of centralizing the revenues and of rendering periodical account of them by personal trips to Paris, the *baillis* were apparently a well established institution as early as 1190, when on the eve of his departure for the crusade Philip prepared his famous *Testament*. Among the bulwarks of monarchy which he was particularly solicitous to create were a systematic budget and a professional army. There is proof that the royal fiscal system acquired in his reign a large measure of regularity and precision and that with the aid of new levies, such as the famous *dîme saladin*, introduced as special emergency measures but gradually absorbed into the system of normal obligations, he managed to maintain a constant surplus of receipts over expenditures. The commutation of military service for a money payment became a general privilege and practise under Philip, who applied the money thus obtained to the construction of a dependable professional army. The protection and assistance which he offered the communes in their struggle for emancipation from the lords also foreshadow the policy of later unifying monarchs. In European politics, particularly in his controversies with Innocent III (*q.v.*) and in his interference in the affairs of the Holy Roman Empire, Philip played a role coordinate with his glamorous conception of kingship. It has frequently been asserted that the popular enthusiasm following the victorious consummation of the battle of Bouvines in 1214 represents the first clear manifestation of a dawning national sentiment in France.

PHILIPPINE PROBLEM. In the middle of the sixteenth century, when the Spanish undertook to establish sovereignty over the group of islands in the western Pacific discovered by Magellan, they found no organized state but a number of small semicivilized villages on the coasts and rivers, each governed by a chief, and a few wild tribes in the interior. The population, estimated at half a million, was predominantly Malay. Agriculture and some small industries were well developed and certain cultural influences were received through trade with the surrounding lands, particularly China. The majority of the people were pagan, but Moslemism had been introduced from Borneo a short time before.

In 1898, at the conclusion of the Spanish regime, there were evidences that real progress had been achieved. The great proportion of the population of nearly seven million had become in many respects a nation, bound together by the Christian religion; only 10 percent of the inhabitants, the Moros of the south and the pagan tribes of the interior, had withstood the missionary zeal of the Spanish friars. The state had joined the church in furthering education and more than 20 percent of the adults could read and write, while a native professional class had been built up. The export industries of Manila hemp, sugar, coconut products and tobacco had become well established under Filipino control; this was particularly so during the latter half of the nineteenth century, when restrictions on foreign commerce had been removed and new encouragement given to the trade with Spain. Most of the foreign trade was with Europe and the United States; the commerce with far eastern countries, less than 10 percent of the total, no longer held the position that it had had in the seventeenth century, when Manila had been the chief trading center in the Orient.

Strictly speaking there had never been a Spanish conquest of the islands. Credit can be given

to Miguel López de Legazpi, leader of the first colonizing expedition, and to the friendly attitude of the island tribes for the establishment of a spirit of cooperation that survived nearly three centuries. With the decline of Spain's world power, however, the quality of her overseas administration fell, here perhaps more than elsewhere, for the Philippines were considered the least desirable post in the Spanish colonial service. Unchecked by the state, the influence of the religious orders increased, becoming more pervasive in the economic, political and social realms. Although the demands of enlightened Filipinos for reform were supported by Spanish liberals, they brought no effective action and finally open rebellion broke out against Spanish rule.

When at this juncture the United States came to the assistance of the Cubans and declared war on Spain, exiled Filipino insurgent leaders joined gladly in the offensive against Spain in the Philippine Islands. Reassured verbally of the disinterested aims of the United States, they wrested most of the country from the Spanish troops, declared their independence and established a republican form of government. The leaders kept the American government fully informed and, although they were unable to secure formal recognition of their independence, they were not curbed and no American protest was registered.

Admiral Dewey and his colleagues, representing the United States in Manila Bay, were in a difficult position. They did not know what attitude to assume toward the islands and their peoples—for an official policy had not yet been formulated in Washington. In the absence of any intimation to the contrary they seem to have assumed that the Cuban policy would be extended to the Filipinos, and as late as June 27, 1898, Dewey cabled the secretary of the navy: "In my opinion, these people are far superior in their intelligence and more capable of self-government than the natives of Cuba, and I am familiar with both races."

But the United States' policy toward Cuba had been dictated more by the necessities of the international situation than by the sentiments of the government. The Philippines, however, were not under consideration at the time war was declared and no commitment respecting them had been made. Thus, following Dewey's victory at Manila Bay, President McKinley was left free to respond to the appeals for a nationalistic policy toward the archipelago.

The growing wealth and power of the United States, newly evidenced by the overwhelming victory of the national arms, encouraged American expansionists. Since isolation was at an end, they said, McKinley should boldly lead the country to take its rightful place in the world. At this critical juncture of far eastern affairs, when Russia and Germany had precipitated a raid of the powers on China's best seaports and a scramble for special rights in the interior, public men like Henry Cabot Lodge, Albert J. Beveridge, John Hay and Whitelaw Reid could speak of the "manifest destiny" that had dropped the Philippines into the lap of the United States. Strongly pro-English, they seconded the many appeals from English leaders urging the retention of the islands as a means of forming a strong Anglo-American front against the threatening partition of China. Further arguments touching the interests of special groups in the United States were not overlooked. The navy had long cherished a desire for a far eastern base. Expanding industry and agriculture demanded new markets for their surpluses; not only would the Philippine trade be theirs, but Manila would become the great entrepôt of the East, giving the United States access to "China's illimitable markets."

McKinley recognized the force of these considerations but he chose to base his own decision for retention on higher ground. Aware of the sentiment against imperialism in the country, and of the activities of his opponents in making political capital of that sentiment, he appealed for national unity in accepting the obligation placed upon the American people by an "all wise Providence." It was the task of the United States to uplift and civilize the Filipinos; honor and duty left no other choice.

In the Philippines the native leaders were not disillusioned as to the objectives of the United States until after the American forces had taken Manila and unceremoniously excluded Filipino troops from the city. In the following six months ill feeling grew, encouraged by sensational journalism on each side. No attempt was made to handle the situation constructively until Dewey cabled on January 7, 1899, to advise that a "civilian commission composed of men skilled in diplomacy and statesmanship should be sent to adjust differences." The commission was dispatched immediately, but it was too late. The inevitable conflict broke out spontaneously on February 4 and the most tragic war in which the United States has ever engaged was launched.

In the United States meanwhile the Democrats, joined by a few Republicans, appeared to have ratification of the peace treaty blocked as long as it transferred the Philippines to the United States. Through a tactical move by William Jennings Bryan the deadlock was finally broken on February 6 when the treaty was ratified with one vote to spare. The Democrats then demanded extension of the Cuban policy to the Philippines, and when this was rejected in Congress Bryan made the question the "paramount issue" of the 1900 presidential campaign.

The question of Philippine independence remained a party issue in the United States. It is essential that this fact be realized, for in no other way can the seeming inconsistencies of American policy toward the Philippines be understood. Proponents of the independence cause have repeatedly attempted to show that from the first the United States promised independence to the Philippines. But certainly the Republican party in 1899 defeated all attempts to enact such a commitment into law. McKinley himself studiously avoided every mention of the word independence. He did promise liberty and self-government; but these were to be attained and enjoyed under the American flag through a program of benevolent assimilation. Thus William Howard Taft, McKinley's appointee as first civil governor of the islands, introduced the notion of the "Philippines for the Filipinos"; this program, bitterly attacked by the dyed-in-the-wool imperialists, nevertheless succeeded not only in winning the gratitude of the Filipinos but also in securing their trust and cooperation, so that the separatist movement was seriously checked.

McKinley's Republican successors in the White House as well as those of Taft at Manila followed the lines of the original policy with little variation, although occasionally their true nature was somewhat obscured by the exigencies of political debate. As time went on and as independence agitation continued, however, it was considered wise to include as a part of America's benevolent policy a promise of freedom. But always to this promise, when uttered by responsible Republicans, have been attached two conditions; namely, independence was to be granted when the United States should deem the Filipinos capable of maintaining it; and it was to be granted if at that time the Filipinos were still convinced that they wanted it. There was never any wavering in the conviction of these Republican leaders that a permanent con-

nection between the two peoples was wise and desirable; and they believed firmly that the Filipinos would share this opinion when they had experienced more of the advantages and benefits of American rule.

The Democratic platforms, on the other hand, repeatedly declared for independence. The Jones Law (signed August 29, 1916) enacted the Democratic purpose into law, for it stated in the preamble that the independence of the Philippine Islands was to be recognized "as soon as a stable government can be established therein." But a Senate amendment to the Jones bill, providing definitely for independence within four years, was defeated in the House when a number of Democrats deserted the party standard for religious reasons. President Wilson's recommendation of immediate independence, in his annual message to Congress in 1920, was little more than a gesture for the Democrats were no longer in control.

In the Philippines, in spite of every American effort to strengthen the conservative forces and to make American sovereignty attractive, there was never a considerable difference of opinion on the independence question; even the most uncompromising of its opponents came to admit that the nationalist movement was supported by the great majority of the Filipinos.

While this simplified statement of attitudes toward independence, that is to say, the Filipinos and Democrats in favor and the Republicans opposed, fits the facts reasonably well up to 1928 or 1929, certain new elements entered to complicate the situation from then on. Thus in the United States important groups of farmers, processors and workers either began to feel, or feared that in the future they would feel, the competition of increasing shipments of Philippine goods to the American market as well as the unrestricted entry of Filipino laborers. By 1928 Philippine sugar imported into the United States exceeded 500,000 long tons and in 1932 total shipments equaled 1,000,000 tons. American domestic sugar producers expressed alarm and Americans with large interests in Cuban sugar were even more perturbed since Philippine sugar with tariff protection was displacing the Cuban product in the American market. Duty free shipments of Philippine coconut oil to the United States exceeded 300,000,000 pounds annually from 1928 through 1931 (although they dropped to 240,000,000 pounds in 1932); resulting competition, direct or indirect, with domestic vegetable oils and butter fats

aroused the opposition of powerful farm and dairy organizations. Failing in their efforts to gain tariff protection against Philippine products, these various groups espoused the cause of complete independence for the islands. They were joined in this movement by organized labor, which protested the unrestricted entry of Filipinos into the United States (there were some 45,000 in the country by 1930), and by various organizations on the Pacific coast which objected to the concentration of Filipino laborers in that section. In many instances old political alignments in Congress were upset by these aroused economic interests and on January 17, 1933, a large proportion of the Republicans in each house joined the Democrats in passing a Philippine independence act over President Hoover's veto.

As for the Philippines themselves, the immi-nence of freedom gave rise to a new interest in its probable effects, especially in the economic sphere, and led to a widespread desire for modification of the former objective of "immediate" independence. Provisions of the independence act were attacked so vigorously that its acceptance by the Filipinos, required under the terms of the law, appeared to be doubtful.

These developments gave new meaning to the question, "Are the Filipinos prepared for independence?" Formerly debated from partisan points of view, it had little relation to the realities of the problem. But in reference to a definite independence act consideration of the available data pertinent to the question became of more importance.

In the political sphere Filipinos had been urged to take part in their own government from the very first. Taft appointed the "better elements" in the population to important positions, including a minority representation on the Philippine Commission, the governing body. He sponsored a provision in the first Organic Act, passed by Congress July 1, 1902, for a Philippine elective assembly, although Beveridge opposed this as hasty and unwise and succeeded in delaying its creation for five years by insisting upon the taking and publication of a census first. By the use of this governmental machinery the Filipinos could participate in native public affairs and effect legislation as long as they followed the general lead of the Americans; but when policies diverged, as frequently occurred, the real power rested with the latter.

Filipinos were introduced into the government offices and into the schools, especially in

subordinate positions, as rapidly as they were considered available. It is interesting to note, however, that when the Republican regime came to an end in 1913 the number of Americans in the Philippine services had remained approximately stationary, at about 2600, for the preceding six or seven years. But the Democrats, under Francis Burton Harrison as governor general, immediately set out to "Filipinize" the services and by 1921 had reduced American officeholders to 600. Also in 1913 Filipinos were given majority control of the Philippine Commission, and in 1916 the Jones Law substituted an elective Senate for that body. It is true that the new law left final discretionary power, in most important matters, in the hands of the governor general, but Harrison chose to cooperate closely with the legislature; in effect therefore a responsible form of government was established. Under Democratic rule this native government assumed a significant role in the national life. There were striking achievements that could be pointed to with pride, such as government ownership and operation of the Philippine National Bank, the Manila Railroad and the National Development Company (with coal, cement and agricultural interests). On the other hand, there were shortcomings in some of the services, especially during the immediate post-war years, which served as ammunition for those who wished to attack the capacity of the Filipinos.

With the return of the Republicans to power in 1921 General Leonard Wood, the new governor general, set out determinedly to correct what he felt were the evils that had crept into the government through Filipino control. Although he wrought no change in the basic law and did not increase the number of American officeholders, he did assert all of the legal authority of his office. Conflict with the Filipino legislative leaders was inevitable, and it was not until Henry L. Stimson, the next governor general, reintroduced some of the features of responsible government that harmony between the legislature and the executive was once again restored.

The Filipinos have been under great pressure to shape their political life to the American model in order to make a good impression on the Americans, who alone held the power of judgment respecting their capacity to govern. On the whole they appear to have made a good record with the democratic forms of government, especially popular elections and majority rule. But they have not been impressed with the

American dogma of the separation of powers nor have they been greatly perturbed by the fact that a two-party system of government has not developed.

Opponents of independence, at least of independence "at this time," claim that an intelligent public opinion, essential to a democratic form of government, does not yet exist in the Philippines. It is pointed out that the total circulation of newspapers has reached only about 200,000, although it is recognized that each copy is widely read. Americans are proud of the accomplishments of the system of public education they introduced, but the 1,200,000 students now in schools represent less than 40 percent of the population of school age. Over half of the people are now literate, although only 10 percent can use English and an equal percent Spanish. Tribal dialects still persist as the predominant means of communication and the attempt to make English a common language, through its exclusive use in the school system, has been far from successful; Spanish is still the favored language in cultured circles, the courts and the legislature. The determination of a national policy toward the language question would be one of the major problems of an independent government.

The American administrators in the Philippines have labored constantly to bring the country health, education, security, justice and prosperity. Once the "pacification" of the islands was complete, peace and security for the individual were not difficult to achieve; nor have there been any violent outbreaks against the constituted authorities. The judicial system, with the exception of the Supreme Court, which is still controlled by an American majority, has been placed in the hands of Filipinos. Although tuberculosis is increasing and the energetic fight against cholera and leprosy must still be carried on, there have been striking advances in health and sanitation. The death rate of approximately 20 per 1000 is a considerable improvement over that of the Spanish period and the early years of American government. Filipinos have had a major part in these achievements; the most severe condemnation of the Harrison regime, however, concerned the failure of the Filipinized health service to prevent a disastrous smallpox epidemic.

Americans and Filipinos alike take pride in the public hospitals, the government buildings and the schools and markets that have been erected. One of the most popular and important

accomplishments of American rule has been the construction of more than 9000 miles of good roads and hundreds of modern bridges. Filipinos can claim credit jointly with Americans for this public works program; incidentally, it was paid for entirely by Filipino revenues. But in relation to the possibility of independence important questions are raised in this connection. The material progress of the country under American rule has been due very largely to economic advantages that may end or be diminished with American withdrawal. Will a native government then be able to continue the social services? And will its imposing roads and buildings turn out to be white elephants? The economic position of the Philippines has come to hold a most important place in the consideration of the problem of independence.

Outside capital has played a major role in the development of dependent countries and it is possible that in most instances a large part of this capital would be withdrawn if the political and military control of the governing power were removed. While such a result might follow the termination of American sovereignty in the Philippines, the loss could hardly be as important to their national economy as it would be to that of most dependencies. American capital has been slow to invest in the Philippines; indeed the total does not exceed that in Hawaii or Porto Rico, which are tiny islands in comparison with the archipelago. The Philippine government estimated American investments in 1932 at \$257,000,000, which sum included practically all of the \$65,000,000 of government bonds outstanding. American direct investments, chiefly in sugar centrals, coconut oil mills, electric utilities, railroads and commercial establishments, represented about half of all the investments in the country exclusive of agriculture and real estate; these latter are almost entirely in Filipino hands. The small retail trade is virtually controlled by the Chinese.

The comparatively small economic stake of Americans in the Philippines can be ascribed to the continuous uncertainty regarding the future status of the islands and also to the prevailing corporation and land laws. Leases or sales of the public lands (including more than 16,000,000 acres classified as arable), either to individuals or to corporations, have been limited to such small areas that it has been difficult to establish large enterprises. The United States Congress included strict corporation laws and limitations on landownership in the Organic Act of 1902.

Filipinos, with legislative power over these subjects since 1916, have maintained the restrictions tenaciously, fearing the postponement of independence if large American interests entered the islands.

Republican administrators, especially in recent years, have attacked these policies on the ground that they discouraged economic development and therefore blocked the extension of the government's welfare and educational services. It is to be noted, however, that this desire to further the prosperity of the people and to increase the economic bonds between the Philippines and the United States was gratified in another way. President McKinley had declared that it was to be the purpose of the United States to maintain an open door in the Philippines. But in 1909, partly to aid stricken Philippine agriculture and partly to further American exports to the islands, reciprocal free trade was established between the archipelago and the United States. The only restrictions were the placing of liberal limits on the amounts of sugar and tobacco that could enter the United States duty free, and even these limitations were removed in 1913. The Philippine assembly protested unanimously against the free trade policy on the score that it would encourage the growth of vested American interests and further postpone independence. Filipino business men and producers, however, did not hesitate to take advantage of the superior returns offered by a protected American market; the result was that the existence of free trade with the American mainland became the most important single factor in the economic system of the islands.

In the first year of the new relationship imports from the United States were trebled; by 1919 American imports mounted to more than 60 percent of the total. Three fourths of all Philippine exports went to the United States by 1927 and 85 percent in 1932. A considerable part of the available Filipino and foreign capital went into productive activities that depend very largely upon the preferred position in the American market (principally sugar and coconut oil but also tobacco, cordage, embroideries and pearl buttons). Production for the domestic market became less attractive; in fact in many lines it became altogether unprofitable because of the competition of duty free American imports. Trade with other countries, including those in the Far East, languished.

It is not surprising therefore that the immediate prospect of independence alarmed all those

concerned with the major export industries (except Manila hemp and copra, which enjoy no protection in the American market). It was demonstrable that the entire economic structure of the islands would receive a severe blow from a sudden termination of free trade, some commentators estimating that government revenues would fall off at least 40 percent. Filipino independence objectives were accordingly modified to include the proviso that privileged access to the American market should continue for a time, either before or after an independent government had been set up, to allow for economic adjustment in the islands. The 1933 act as finally adopted by Congress provided for a ten-year period preceding independence during which free trade should continue but with duty free imports into the United States limited, in the case of sugar to 850,000 long tons annually and in the case of coconut oil to 200,000 long tons; on the other hand, the law did not empower the Philippine government to levy tariffs against American goods during this period as a means of encouraging domestic industries or to negotiate trade agreements abroad in an effort to develop new foreign markets.

The independence question has always had its international aspects. It is quite possible that the attainment of the goal in the Philippines would strengthen independence movements in British India and Malaya, in the Dutch Indies and in French Indo-China. No one can tell how extensive this influence might be, however, and in the United States and throughout the world judgment of the consequences will depend upon attitudes toward the whole colonial problem.

The problem of the balance of power in the Pacific also enters. It is presumed in some quarters that the withdrawal of the United States from the Philippines would create a new situation leading to the unsettlement of political forces and a new struggle for naval power in the Pacific. As a matter of fact, if the United States should retain a naval base in the islands, as it is empowered to do by the independence act, the international situation would be little changed. Japan would continue to hold naval dominance in the western Pacific at least so long as the terms of the Four Power Pacific Pact of 1922, precluding the further armament of bases in that area, were maintained. But in the potentialities of the Philippine base the United States would still hold a strong bargaining point in relation to possible revision of that pact. If, on the other hand, all rights to an American base

in the archipelago are relinquished, perhaps in connection with the neutralization of the islands (and this is a possibility under the terms of the independence act), then American policy would be modified materially. In the judgment of some this would mean an irreparable loss of that "prestige" which they deem essential in dealings with oriental peoples. But others maintain that the withdrawal of the United States from the islands and the renunciation of force in the Orient would strengthen the American position in that area.

When the United States obtained the islands, one of the reasons advanced for the step was the possibility of their acquisition by some other nation (Germany was usually named); and this was presumed to be undesirable from the standpoint of Americans and Filipinos alike. But with the rise of Japanese power, Americans and to a lesser degree Filipinos have feared the inclusion of the Philippine Islands in the Japanese program of expansion. In substantiation of this it has been pointed out that the islands are a natural geographical extension of the Japanese archipelago and that the two areas combined form a potential barrier to all direct Pacific trade routes between Asia and the Americas. Also not only do the tropical Philippines and industrial Japan complement each other economically, but Japan's eyes cannot be entirely closed to the presence in the Philippines of coal and iron deposits. It is further maintained that the existence of great areas of arable land, at present unoccupied, might attract the Japanese as an outlet for a rapidly increasing population. The usual reply to this point has been that the Japanese will not live in the tropics and would not find the Philippines attractive. There were, however, in 1932 nearly 20,000 Japanese in the islands, twice as many as in 1925, and most of them were in abaca fiber colonies in the province of Davao on the sparsely populated island of Mindanao, the extreme southern and tropical part of the archipelago. It is true that the Chinese outnumber the Japanese in the Philippines by 50,000, and some observers express greater fear of their overrunning the islands.

Certainly possible Japanese interest in the islands is a problem that requires consideration. It is quite probable that the United States will find it either impossible or inconsistent to retain a naval base and at the same time negotiate a multilateral treaty of neutralization of the islands. The great majority of Filipinos appear to oppose military and naval reservations of the

United States, the early desire of some for an American protectorate having yielded to a preference for international guaranties, especially through membership in the League of Nations. Furthermore it is charged that an American base would continue to expose the Philippines to probable attack in the event of hostilities in the Pacific involving the United States. Japanese leaders, on their part, have always denied territorial ambitions in the Philippines and on many occasions have given assurances that Japan would join in an international treaty of guaranty. Indeed Japan's trade with the islands is certain to profit so greatly by the termination of the present exclusive free trade policy between the United States and the Philippines that Tokyo probably would be glad to make any reasonable commitments to accomplish that end—although, to be sure, the relinquishment of an American naval base at Cavite, menacing Japanese waters, might be requested as a preliminary to any agreement.

In any event there will always be considerable foreign political and economic interest, particularly on the part of Americans and Japanese, in an independent Philippines. If there is to be a general guaranty of Philippine sovereignty, it is important that agreement should be reached at the outset as to the precise nature of that guaranty as well as to the specific measures to be employed in safeguarding the vested rights and interests of foreign nationals.

Tremendous difficulties must be faced by an independent Philippine government. The educational, social and political advances of the Filipino people under American rule have been good preparation for the responsibilities of citizenship. The material progress of the country at the price of an ever increasing dependence upon the United States must, however, be considered a mixed blessing. It has become apparent that if independence is to be achieved at all it must be at the price of at least temporary economic loss.

As the inevitability of the choice has become clearer to Filipinos, they have been forced to reexamine the independence objective. An attractive picture was drawn for them of the advantages of a permanent connection with the United States, voluntarily accepted by them, with continuing economic prosperity combined eventually with complete self-rule under the protection of the American flag. It is quite possible that this program, the culmination of the Republican policy for the Philippines, would

have carried the day, or that it might yet do so, if it were not for three seemingly insuperable obstacles. First, it was realized by Filipinos that there could be no guaranty of the indefinite continuance of the present favored position of Filipino products in the American market; the demonstrated political power of competing American interests established that fact. Second, it was obvious that there could be no voluntary agreement between these peoples as long as one maintained sovereignty over the other; the character and the permanency of the relationship were bound to be subject to unilateral action on the part of the United States and at any time. And, third, there was the inescapable fact that a racial barrier would continue to exist between the two peoples, strictly adhered to by many Americans and forever resented by Filipinos.

These are some of the complexities of the Philippine problem. One may be forced to the conclusion that it never will be permanently solved until the Filipino people become an independent nation able to work out their own destiny in a world which will not require them to appeal to arms either for the achievement or for the maintenance of their independence.

PHILIPPOVICH VON PHILIPPSBERG, EUGEN (1858-1917), Austrian economist. Although he was a Viennese by birth and early training Philippovich—at least at the beginning of his career—was closer to the German historical school than to the contemporaneous Austrian school of Menger, Wieser and Böhm-Bawerk, with whom his name is commonly associated. Soon after his admission as *Privatdozent* to the University of Vienna, he obtained a chair at the University of Freiburg, which he held from 1885 to 1893. His first book, *Die Bank von England im Dienste der Finanzverwaltung des Staates* (Vienna 1885, 2nd rev. ed. by F. Somary 1911; tr. by C. Meredith, National Monetary Commission, vol. viii, no. 2, Washington 1911), is the one best known outside Germany. His main interest, however, was in the movement for social reform (*Sozialpolitik*), in which he took a very active part. Although cooperating closely with the German group of the Verein für Sozialpolitik he realized better than most of its other prominent members the necessity for a sound theoretical foundation for any program of economic policy.

In the course of time he became more influenced by the Austrian theorists, and when he published the first volume of his *Grundriss der politischen Ökonomie* (2 vols., Freiburg i. Br. 1893-1907, rev. ed. Tübingen 1914-16), which was destined to become the leading German textbook on general economics for the next quarter of a century, it proved to be the kind of compromise between the two opposing schools which would make it acceptable to both. Because Austrian ideas became known in Germany mainly through his *Grundriss*, he came to be considered as one of the leading members of the Austrian school. While this is not strictly correct, it is true that during his activity in the

University of Vienna, where he held one of the chairs of political economy until his death, his increasing interest in theory made him more critical of many of the schemes of social reform. This is clearly evident in *Die Entwicklung der wirtschaftspolitischen Ideen im neunzehnten Jahrhundert* (Tübingen 1910), which is perhaps his most brilliant and mature publication. He remained, however, a lifelong believer in a state regulated economic system, which was to be neither pure capitalism nor socialism. With this object in view he took an active part in German and Austrian political life and in 1907 became a member of the upper house of the Austrian parliament. The influence which Philippovich and the group called the Austrian Fabians, of which he was the leading spirit, have exercised on social legislation in Austria is very considerable.

PHILIPPSON, LUDWIG (1811-89), German Jewish theologian and journalist. Philippson was born in Dessau and educated at the University of Berlin. At the age of twenty-two he was appointed rabbi by the Jewish community of Magdeburg, where he officiated for twenty-eight years. The rest of his life he spent at Bonn. Philippson took an active part in German and Jewish politics and negotiated with the German government concerning the political status of the Jews. He advocated a central organization of the German Jewish communities and was one of the founders of the Deutsch-Israelitischer Gemeindebund. He helped also to establish the Hochschule für die Wissenschaft des Judentums in Berlin.

Philippson's religious standpoint was that of moderate reform. He was the mediator between the extreme reform movement of Abraham Geiger and the extreme orthodoxy of Samson Raphael Hirsch. His goal was the regeneration of Judaism on the basis of the historical heritage of Israel. He declared that messianism was the central idea of Judaism and that it was Israel's task to preach and spread the idea of ethical monotheism throughout the world. These theories, developed in Philippson's numerous

homiletic writings, exercised a strong influence upon German Jewry.

Philippson's lasting accomplishment, however, was the creation of Jewish journalism. In 1837 he established the first regular Jewish weekly, the *Allgemeine Zeitung des Judentums*, which he edited until his death. Whereas previous periodicals had dealt only with restricted spheres of Judaism and had appeared irregularly, the *Allgemeine Zeitung des Judentums* aspired to cover the entire range of Jewish life and letters. Jost was fully justified when in 1847 he called Philippson's paper "an epoch in Jewish history." The *Allgemeine Zeitung des Judentums* became the model for Jewish magazines all over the globe.

In order to spread Jewish education Philippson founded in 1855 the Institut zur Förderung der Israelitischen Literatur, which became the model for later Jewish literary publication societies.

PHILLIP, ARTHUR (1738-1814), British empire builder. Phillip was a naval officer of varied experience when in 1786 he was appointed governor of the convict colony in New South Wales. As organizer of the expedition and founder of the first settlement in Australia he showed foresight, industry and idealism. When the first fleet reached Botany Bay in 1788, Phillip, realizing it was unsuitable for settlement, established the colony instead at Sydney Cove in Port Jackson. For some years the settlement depended upon irregular arrivals of

supply ships and was continually threatened with starvation. Phillip's courage and resource, however, enabled it to survive. His aim was to make the colony self-sufficing; but in addition to the usual pioneering problems he had to deal with the poverty of the soil around Sydney, friction with the natives, whom he tried vainly to conciliate, and the poor quality of convict labor. Phillip offered land grants to those who were willing to clear and cultivate the land and remain on it for at least five years, and he even exceeded his instructions in giving them assistance. He instituted the practise of assigning convict laborers to free persons and urged upon the home authorities the need for sending free colonists of the former class who would provide a capable nucleus for a farming population. He endeavored by favored treatment of the deserving to induce the better class of emancipated convicts or those whose terms had expired to remain in Australia, but without much success. Nevertheless, when he left for England in 1792 he had organized the government farms and workshops, established civil and criminal courts and in general laid the foundations of the colony.

Consult: Becke, Louis, and Jeffery, Walter, *Admiral Phillip* (London 1899); Rusden, G. W., *History of Australia*, 3 vols. (2nd ed. Melbourne 1897) vol. i, p. 24-65, 122-86.

PHILLIPS, WENDELL (1811-84), American reformer and abolitionist leader. Phillips came of an old and wealthy American family and was educated at Harvard University and Law School. Apparently his interest in abolition was aroused when he witnessed the attempted lynching of William Lloyd Garrison by a mob of Boston "respectables" in 1835. He ascribed his actual conversion to the abolitionist cause to Ann Terry Greene, whom he met in 1836 and who subsequently became his wife. Phillips sprang into prominence as an abolitionist orator as a result of his speech at Faneuil Hall on December 8, 1837, at a meeting to protest the murder of Elijah Parish Lovejoy; this speech has been ranked by George William Curtis with those of Patrick Henry at Williamsburg and Abraham Lincoln at Gettysburg. In 1839 Phillips abandoned his law practise because he could no longer comply with the attorney's oath to support the constitution.

Like Garrison, whom he followed in most matters, Phillips urged immediate and unconditional abolition; advocated education and agi-

tation rather than political action; attacked the constitution as a defense for slavery, urging disunion if necessary; opposed Negro colonization in Africa; and excoriated the ministry for justifying slavery by Scriptural quotations. Unlike Garrison he opposed the reelection of Lincoln. After the Civil War he insisted, successfully despite Garrison's opposition, that the Anti-Slavery Society continue its agitation until suffrage was granted to the Negro. He succeeded Garrison as president of the society, which was finally dissolved after the passage of the Fifteenth Amendment.

Phillips was one of the few prominent abolitionists who transferred their ideas of freedom to the support of the labor movement. In 1870 he was the candidate for governor of Massachusetts on the newly formed Labor party ticket. At one time or another he also supported such unpopular causes as woman's suffrage, nihilism, independence for Ireland and the abolition of capital punishment.

PHILO JUDAEUS (c. 30 B.C.-c. 45 A.D.), Jewish philosopher and theologian. A member of a distinguished family and the brother of the alabarch, the head of the Alexandrian Jewish community, Philo lived in Alexandria, his native city. In the year 40 he visited Rome with a Jewish mission to Caligula. In his numerous writings, composed in Greek, he set himself the task of amalgamating the spirit of Judaism or Mosaism with that of Greek philosophy. Indeed he regarded the laws of Moses as a philosophy, the only true one, and endeavored to show that the best thought of the Greek philosophers was in agreement with it. To this end he employed the so-called allegorical method of interpreting the Scriptures. On the Greek side he was influenced chiefly by Plato, Aristotle and the stoics, all of whom he used eclectically.

Philo's main contribution to philosophy and theology is his doctrine of the Logos, which reflects Heraclitean, Platonic and stoic influences. Maintaining the extreme transcendence of God, Philo found it impossible to con-

ceive of God as coming directly in contact with matter, which in its pure and lowest form is the essence of passivity. Hence he looked upon the physical world as the product not directly of God, but indirectly of certain intermediate powers emanating from Him. The Logos is the principal one of these powers. It is the universal reason, in which man's reason participates. The lower parts of the human soul, the senses and the passions, are like the body tainted by matter and hence inferior in their nature. The aim of human existence therefore is to live as little as possible the life of the body, the senses and the passions and as much as possible that of the mind or reason; in other words, man should endeavor to be as like unto God as is permitted to a creature.

Virtue is the path to this ideal, and among the virtues justice occupies an important place. Philo defines justice in Platonic fashion as the harmony of the other three cardinal virtues, wisdom, courage and temperance, and like Aristotle and the stoics as that which gives to everyone his due. His definition of law is stoic also. To follow reason and imitate God is to keep God's law, for "Law is nothing else but divine reason (*Logos*), enjoining what is right and forbidding what is wrong."

The Logos of Philo has an interesting history, since except for the prologue to the *Gospel of John*, which may or may not be influenced by Philo, it was hypostatized, or personified, by the early patristic writers and identified with Christ, the second person in the Trinity, representing divine wisdom. This idea was adopted by the scholastics, from John Scotus Erigena through Anselm and Abélard to Thomas Aquinas, and even by later philosophers.

PHILOSOPHY. Definitions of philosophy are usually made from the standpoint of some system of philosophy and reflect its special point of view. For the purposes of this account the

difficulty may be avoided by defining philosophy from the point of view of its historical role within human culture. Since the survey is confined to western civilization, the origin of European philosophy in Greece supplies the natural beginning. For not only does the name "philosophy" come from Greek thought, but also the explicit consciousness of what is denoted by the term. Greek thinkers moreover distinguished the branches into which philosophy is still conventionally divided; they laid the foundations of logic, cosmology, metaphysics, ethical and political philosophy, and to a lesser degree, aesthetic theory. Even if these foundations are not always built upon, it is impossible to understand departures and innovations apart from some reference to Greek thought. In Greek philosophy the problems of western philosophy are either formulated or adumbrated.

The reason for the primacy of Greek thought is not accidental, nor is it for the most part a mere matter of chronological priority. On the contrary, the reason for it is an essential part of a definition of philosophy from the cultural point of view. For Greece was a ground for exhibiting and proving most of the difficulties and predicaments that arise in the collective relation of man to nature and fellow man. This condition would not of itself have generated philosophy without the extraordinary capacity of the Greek mind for observation and statement. An explanation of this fact would here be irrelevant and perhaps impossible. Such is not the case, however, with respect to the traits of Greek culture that called forth the reflections that initiated western philosophy: these exhibit in striking fashion the typical conflicts of collective human experience. Consequently, in spite of the limitations of the Greek world in space and time, Greek traits form the very stuff out of which philosophy is made. Greece, and especially Athens, was an intellectual looking glass in which the western world became conscious of its essential problems. The Greek origins of the European philosophical tradition dispose completely of the notion that philosophical problems evolve in the consciousness of lonely though brilliant thinkers. These origins prove that such problems are formulations of complications existing in the material of collective experience, provided that experience is sufficiently free, exposed to change and subjected to attempts at deliberate control to present in typical form the basic difficulties with which human thought has to reckon.

Greece was distinguished from other ancient civilizations in that priests lacked political authority, having indeed become subordinate civic officers. Equally important was the fact that religious beliefs were early set forth in literature of great artistic merit, never in the form of dogmas. The resulting intellectual freedom furnished the primary condition for the production of philosophy. The cosmogonies that characterized Greek mythology in common with all other religions were emancipated with comparative ease from a predominant religious setting and were transformed into reasoned attempts at a rational account of the origin and constitution of the known world. The early thinkers in the Grecian colonies in Asia Minor and Italy and its islands were geographers, astronomers, geologists, meteorologists, founders of the natural sciences quite as much as they were philosophers. Their generalized and comprehensive stories of the cosmos and its origin created an idea of completeness and breadth of view that remained as part of philosophy after the sciences had become specialized. The physical interest of these early thinkers persists today in that branch of philosophy called cosmology.

It was probably natural that interest in physical nature should have predominated in the adventurous, seafaring, trading Greek colonists, especially as their political life was borrowed. In Athens, however, cosmology was definitely subordinated to moral and political interests. Throughout Greece generally, with the exception of Sparta, civic matters were adjusted through the medium of discussion. Athens was moreover a pure democracy in that all citizens rather than a delegated body took part in public affairs. Party conflict was rife and changes in type of government were frequent. The situation was expressed, on the intellectual side, in consciousness of a number of problems defined in terms of antitheses. There were, for example, the problems of stability versus change, of harmony and order versus conflict, of reason (represented by discussion and consultation with a view to persuasion) versus force. Intermingled with these were other questions brought to the fore by the traveling scholars called sophists. Although, chiefly owing to the attacks made upon them by Plato, the term sophist has now a distinctly derogatory significance, the sophists were: only the learned men of the day who traveled about offering their intellectual wares for sale—and with the Greeks all important education was adult education. Disputes regarding

the role assumed by these men evoked such further antitheses as tradition versus innovation, the relations between custom and conscious thought, between nature and culture, between nature and art—since the sophists professed to teach all of the arts that were in good repute; that is, those above the level of the manual craftsman, such as the military art and the art of managing the household and the city-state.

Socrates, the initiator of Athenian philosophic reflection, deliberately strove to limit theoretical discussion to moral and political subjects. Apparently the direct stimulus to his conversations on these topics came from the sophists. His primary question was whether the various forms of social excellence, the "virtues," which command recognition by others, can be taught and if so how. Consideration of this theme led him to consideration of the relation of the various virtues to one another and to their unity in understanding, or rational insight. Since rational insight was found by him to be practically non-existent among politicians, among the poets, who were the acknowledged moral teachers of the community, as well as among the sophists, his teaching came to its climax in a demand for the pursuit of understanding or wisdom.

The philosophical tradition of the western world did not originate because of a mere taste for abstract speculation or yet because of pure interest in knowledge divorced from application to conduct. On the contrary, wisdom, in its material and goal, was something more than science even though it was not possible without science. It was science enlisted in the service of conduct, first communal, or civic, and then personal. Most of the distinctive traits of philosophy through the ages are intimately connected with this fact. The connection is not external or due to the accident of its origin in Greece, but is intrinsic. The Greeks brought to consciousness three problems that are bound to emerge whenever civilization becomes reflectively turned back upon itself: What are the place and role of knowledge and reason in the conduct of life? What are the constitution and structure of knowledge and reason by virtue of which they can perform the assigned function? And, growing out of this question, what is the constitution of nature, of the universe, which renders possible and guarantees the conceptions of knowledge and of good that are reached? Upon the whole, in course of time, philosophy began with the last question, and this fact often disguises the initial problem as to the guidance of life and

conduct. But the tie that unites the seemingly most remote speculations with this issue has never been completely cut.

The problem of the organization and direction of personal and community conduct was still uppermost with Plato, although he took steps which led to an apparent relegation of that issue to a secondary position, a fact that has frequently caused his modern interpreters to place him in a perspective foreign to his own intent. Instead of excluding or neglecting speculations about the constitution of nature in formulating the end of the organized state and individual, he asserted that the problem of the end and of good can be solved only when the inquiry is extended to include the totality of things and when the final conclusion is reached by understanding the constitution of nature. This latter problem moreover can be solved only as the problem of the structure and method of knowledge is solved. Thus the ethico-political problem was widened to include cosmology and logic. Dialectic became central, not merely auxiliary, in the philosophic scheme, for it was the means by which insight into the good was to be attained. By reason of the place of the good in the structure of the universe this fact instituted a necessary connection between logic and metaphysics.

Because of the inherent relation set up by Plato between cosmology, science (especially mathematics), logic and political ethics, his fundamental distinctions, such as those between being and becoming, reality and appearance, form and matter, whole and part or universal and particular, were not presented by him as detached intellectual distinctions. While he defines philosophy as desiderated science of the whole, he defines it also as the legislative science, or science of the state, since social organization is the form in which man is most directly concerned with the whole.

The distinction of reality and appearance has an ethical import as well as one running through knowledge—where it appears in connection with the distinction between science and mere opinion—and through metaphysics. Morally it involves the question of the individual in his relations to others, since evil never offers itself as such but disguises itself as a good: the bad man strives to *seem* good in order to obtain recognition, while the truly good man is content to *be*, without regard to appearance, that is, the impression made on others. Starting from this ethical distinction, Plato was able to follow the

difference and relation of the two throughout a series of logical and cosmological terms, such as one and many, permanent and changing and so on. Being with Plato always has the connotation of the stable, the dependable, while change imports instability and variation—departure from a standard which is fixed. In a similar way his distinction of universal and particular is not merely logical or merely metaphysical, but is concerned with the relation of law—which is legislative and normative—to application to the individual in judicial decision and administration. Such points are arbitrarily selected examples of the interpenetration of the politico-moral with the logical and metaphysical, which is evidenced on a larger scale in his most systematic work, the *Republic*, since this is at once a treatise on metaphysics, theory of knowledge, politics and education.

It is evident that the interpenetration which, in the case of Plato, gave meaning to philosophy as the search for wisdom could not long be maintained in the form in which he set it forth. Philosophy was in a condition of unstable equilibrium with respect to the various factors contained in it. To Plato it seemed still possible, at least as an intellectual and moral aspiration, to reform and preserve the city-state. The fact that Aristotle was a tutor of Alexander the Great indicates that the failure of this dream was imminent and consequently a redistribution of the constituents of the whole inevitable. The direction it took, especially in the subordination of morals and politics to metaphysics and science and of practice in general to theory defined as contemplative cognitive possession and enjoyment of being, was connected with Aristotle's own naturalistic interests. It thus happened that while he could retain and utilize most of the leading distinctions of Plato, he gave philosophy as a whole a radically different turn and form. While to Plato the apprehension of real being was not complete until the insight was reembodyed in control of phenomena through the appropriate organization of the latter, to Aristotle science was its own end, and everything in the sphere of action dealing with persons and things was relegated to an inferior order of probability and opinion. The separation thus effected by Aristotle enabled him to distinguish, define, and classify in a way not open to Plato, since the latter's problem was to institute actual connection between matters assigned by Aristotle to different classes or realms. The outcome was a marvel of systematization, which much

later, at the height of scholasticism, became the model for the summing up and organization of knowledge from the standpoint of the prevailing theologies, Jewish and Christian.

Subsequent to the dissolution of Greece, during the time of the supremacy of Rome in politics, of Alexandria and oriental beliefs in religion, the values assigned by Aristotle became as unreal to his successors as the Platonic social aspirations had been to Aristotle. During the period which Gilbert Murray describes as "failure of nerve," the chief interest of thinkers was in the supernatural. There ensued of necessity a period of acute metaphysical speculation with all phenomena arranged and interpreted in hierarchical descent from supreme being, a reality unattainable by way of scientific thought but capable of being at least occasionally grasped in mystic intuition. Thus neo-Platonism effected a further distinctive redistribution of the constituents of philosophic reflection, because of a new center of dominant value. Thinkers in Rome, more removed from oriental influence, translated philosophy into a practical direction of conduct, a tendency common to stoic, Epicurean and skeptic schools. The domination of western European life by the Roman church introduced another factor, and from the time of St. Augustine through the twelfth century there was a systematic distribution of metaphysical, logical, cosmological and ethical factors worked out on the basis of the supremacy of the values characteristic of religious faith.

The purpose of the foregoing is not to sketch, even in outline, the history of philosophic thought, but to suggest the features that have always been characteristic of philosophy, and to indicate that cultural causes have produced the main changes in the direction and content of philosophic systems. If the movement of modern philosophy were followed, its tendencies would be seen to be connected with the new values that emerged with the revival of scholarship in the Renaissance, and especially with the growth of the natural sciences and the secularization of interest that mark recent centuries. Such a historical survey shows the necessity of defining philosophy from the standpoint of value, since the changes of philosophy are all inherently bound up with problems that arise when new emphases and new redistributions in the significance of values take place. For example, it is as certain as anything can be that if science, at present a dominant interest, were to become subordinated to some value that may

emerge in the future, there will be produced a new set of problems and hence of philosophies.

The connection of philosophies and of change in the aim and method of philosophizing with changes in culture and social organization, which bring about redistributions of collective valuations and prestige, makes it possible to explain the fact that each system has a definition of philosophy couched in its own terms. For each philosophy is in effect, if not in avowed intent, an interpretation of man and nature on the basis of some program of comprehensive aims and policies. The generality and comprehensiveness claimed for philosophy have their origin in this fact. Each system has of necessity an exclusive aspect, often expressing itself in a controversial way, because it is, implicitly, a recommendation of certain types of value as normative in the direction of human conduct.

This intimate connection of philosophy with the values that interpret existence and direct conduct explains certain matters related to it. Philosophy has always, for example, been associated with religion either by way of derivation and justification or by way of criticism, and religious beliefs evidently claim to be concerned with ultimate values while religious attitudes claim to be supreme in conduct. But since philosophy must formulate its conceptions and interpretations in rational form, each philosophy depends necessarily upon the intellectual currents and the best authenticated knowledge of its time—in other words, upon science. As a consequence of its relation to religion and morals on one side and to science on the other, philosophy occupies a peculiar position with respect to literature. While philosophies have not as a rule been presented in an especially satisfactory form, they have aimed at appeal and persuasion more general and more moving than those of the specialized sciences. They have striven to bring about adoption of certain basic attitudes, not merely to convey information.

Finally, philosophy has a close connection, in some cases direct and in others indirect, with matters of conduct. The connection is direct when those studying or accepting a given philosophy are thereby committed to a certain way of life, including personal discipline. This was the case, for example, with the Pythagoreans, cynics and stoics, and Epicureans. A trace of the idea remains in the popular notion (derived from stoicism) that a philosopher should be able to endure pain and the vicissitudes of life better than others. The indirect connection is illus-

trated in what has been said about the socio-ethical setting of philosophy in the case of Socrates and Plato. It is exemplified also with the scholastics, with Spinoza and John Locke, with the materialistically inclined *philosophes* of the eighteenth century, with Rousseau, Karl Marx, John Stuart Mill, Herbert Spencer and most great names in the history of thought. In spite of Aristotle's deviation from Plato, concern with the good, with value, is characteristic of the Stagirite thinker as well. For he asserts that the life of *theoria* is higher than that of *praxis*, so much higher that it defines the being and activity of God. Distinctions of higher and lower are found indeed throughout all his professedly purely cognitive distinctions and classifications. The philosophies that most emphasize scientific form and content also set forth a conception of the value of science.

It is a generic definition of philosophy to say that it is concerned with problems of being and occurrence from the standpoint of value, rather than from that of mere existence. There are of course various and varying types of philosophy that claim to connect philosophy directly and exclusively with science. Some of them regard philosophy as the ultimate science, holding that it deals with reality as a totality or as perfect being, in contrast with the special sciences, which deal with it piecemeal or with mere phenomena. Others hold that it is concerned with effecting a comprehensive synthesis of the results of the special sciences. Still others assert that it is concerned with analysis of the unexamined concepts and postulates that lie at the base of the special sciences. It would not be just to say that the conflict of these views with one another throws out of court any view that connects philosophy exclusively with science. But upon examination it will be found that the cause of the divergence of views resides in some difference of valuation or else that the theory of science is itself enclosed in a tacit context of valuation.

The connection of philosophy with conflicts of ends and values serves to explain two criticisms frequently brought against the enterprise of philosophy. One of them points to the diverging and controversial character of philosophy in contrast with the definite trend toward unity in the sciences. If, however, valuation enters into philosophy, divergence is inevitable. It could not be eliminated except by attainment of a complete consensus as to universal ends and methods. If those who hold up different values

as the directive aims of life were to agree with one another in their interpretations of existence, it would be a sure sign of insincerity. Relativists and absolutists, radicals and conservatives, spiritualists and materialists, differ primarily in their systems of value, and their strictly intellectual differences follow logically. How can those who believe in the necessity of a transcendent source of authority agree with those who believe that the seat of authority is and should be in the processes and operations of actual experience? In spite of conflicts philosophy serves the purpose of clarifying the source of opposition and the problems attendant upon it; while with respect to some problems articulation and clarification are more significant than formal solution.

The other indictment of philosophy, that it mills around among the same problems without settling any of them, may be met, on the basis of the relation of philosophy to value, by pointing out that no phase of culture can settle the problems that arise in and for another phase of culture. General problems regarding aims and the means appropriate to their realization arise in every type of social life. They have formal features in common, and these are stated in philosophical generalizations. But in actual content they differ, and hence they have to be dealt with in the terms both of the science and of the dominant practical tendencies of each period. Only if social institutions and the culture attending them were wholly static would it be possible to carry over completely the solutions or even the methods of one epoch into the conditions of another.

A striking illustration of the formal constancy of certain problems along with tremendous change in content is found in the question of the relation between the individual and the universal. Conflicts between the individual and the total order of which he is a part are bound to arise in every complex and changing culture. Wherever reflection is free and energetic, these conflicts will be generalized and will take conceptual form as the problem of the relation of universal and particular. In this conceptual form they will have a certain independent dialectical career of their own. But the state of knowledge and the state of institutions are the variables of the formal relationship, and they will inevitably color the meaning of the problem. One has only, for example, to contrast Greek, mediaeval and contemporary culture with respect to the knowledge of nature bearing upon this problem and with respect to the political and economic

conditions that determine the actual status of individuals, to see how constancy of the problem in formal terms is compatible with great variability in content, so that the issue must be approached from a new point of view, never repeated in subsequent history.

The same considerations explain the diversity of solutions propounded. For difference of valuation signifies difference of interest, of emphasis and hence of weight and perspective. For example, one who at the present time gives primary weight to the findings of the physical sciences will still have at least two opposite courses open to him. From one point of view he will see how careless nature is of the conservation and development of complex highly organized individuals, and will rate low the place of individuality in the scheme of things. On the other hand, he may be impressed by the breakdown of the Newtonian philosophy of ultimate atoms, inherently all alike and differing from one another only in external matters, such as spatial position and rate of motion, and by the tendency to regard all laws as statistical norms not exactly applicable to any individual particle, and hence will infer that unique individuality is rooted in the very nature of things. And one who approaches the problem from the side of material organized biologically and socially has open to him also a choice in valuations. He may esteem development as higher than order and identify individuality with the principle of progress. Or he may be troubled by disorder and disturbance and thus be led to subordination of individuality to the whole on the ground that individuality by itself leads to anarchy and chaos. There will be other times in which a fair equilibrium of the two principles will obtain and this particular problem will temporarily sink into the background, some other widely felt predicament directing attention and interest to the need of conceptual formalization of another conflict.

The conception of philosophy that results from the account just presented is in fundamental contrast to that view of philosophy which regards it as an ultimate science disclosing the intrinsic nature of reality as distinguished from the special sciences, physical and social, which reveal only phenomenal manifestations. Even, however, if the latter view is held, it must be admitted that it can apply literally only to some one of the diverse systems characterizing the history of thought, and that other systems have to be accounted for, if at all, in cultural terms.

Presumably also one may find in the contemporary state of culture at least the causes for the emergence of the particular view of reality assumed to be correct.

In other words, whatever else philosophies are or are not, they are at least significant cultural phenomena and demand treatment from that point of view. When philosophy is so approached, a highly important role must be given to any intellectual effort which seizes upon the characteristic disturbances and needs manifested in a particular culture (including of course its scientific resources as well as its institutions) and which formulates them in the most generalized terms the epoch has at its command. The conception of philosophy reached from a cultural point of view may be summed up by a definition of philosophy as a critique of basic and widely shared beliefs. For belief, as distinct from special scientific knowledge, always involves valuation, preferential attachment to special types of objects and courses of action. Beliefs moreover are intimately attached to customs and institutions, partly as effects, partly as causes, so that forces which impinge upon institutions and tend to unsettle them have a disturbing impact upon beliefs, and vice versa. Thus philosophies are generated and are particularly active in periods of marked social change, provided of course that the people undergoing change have sufficient powers of reflection to undertake the task of abstraction and generalization.

This last statement obviously applies to the origin and development of philosophy in Greece; to the twelfth century, when Christian doctrine received comprehensive formulation; to the Renaissance; to the seventeenth century, when the scientific revolution occurred; to the eighteenth, when there dawned a conception of the applicability of science to a progressive determination of social life. When once the principles underlying beliefs and valuations have received formal statement, the resulting concepts obtain a certain independent intellectual existence of their own and are capable of having their own career without reference to the cultural conditions of their origin. This secondary and derived existence is accentuated when, as so often happens, professional teachers are the chief guardians and representatives of philosophy.

From one point of view, then, the chief role of philosophy is to bring to consciousness, in an intellectualized form, or in the form of problems, the most important shocks and inherent troubles

of complex and changing societies since these have to do with conflicts of value. Viewed with reference to this highly general function, historic systems tend to divide into the conserving and the revolutionary. The tendency of some is to preserve the values that are already embodied in the traditional, relatively established order. They accomplish this task by giving these values a reasoned statement and by setting forth their rational justification. Other thinkers, sometimes the most important of an entire generation, are acutely conscious of the deficiencies and corruptions of the existent order. They shape their logical methods, their interpretations of knowledge and even their interpretations of the cosmic order, with a view to showing the necessity of radical changes and to pointing out the character of needed reforms.

In this general sense the philosophy of Plato is "revolutionary," that of Aristotle is "conserving." The so-called transcendentalism of Plato, his insistence upon pure forms apart from concrete incarnation as standards of existence, is directly associated with his desire for thoroughgoing reform. To change the actual he required leverage outside of the actually existent, an independent realm of possibilities higher in value and potency than anything found in existence. Aristotle's insistence that forms have no existence apart from their actual embodiment corresponds, on the other hand, with his general tendency to rationalize the existent world by exhibiting it as containing upon the whole (special aberrations excepted) all the meaning and value that the nature of the case permits. His oft cited justification of slavery, for example, does not indicate a private harsh preference on his part, but an attempt to find a rational meaning in a universally established institution. The formulations of scholasticism are of the same rationalizing import, finding an underlying meaning to justify the beliefs and practises sanctioned by the church. The general tendency of eighteenth century thought, on the contrary, was determined by Locke and also, as regards the *encyclopédistes* and Condorcet, by Bacon; it was critical of if not actually hostile to existing institutions, and it used the new sciences of nature to project ideals of a new and better future. In contrast, the philosophy of Germany in the first half of the nineteenth century, culminating in Hegel, was distinctively justificatory of the main types of existence, exhibiting them as necessary stages in the self-manifestation of absolute mind and treating the French Revolution as proof of

the bankruptcy of the opposite empirical philosophy.

The opposition is never as polar in fact as are the tendencies in the abstract. There is always a certain amount of adverse criticism and of implicit condemnation in the philosophies whose main purport it is to exhibit the meaning implicit in the existent forms of nature and culture. For in justifying the logical content of their philosophies, thinkers are usually compelled to indicate the transitory and relatively unimportant character of some of the particular forms in which they are embodied, regarding them as husks in comparison with the inner kernel. Thus Hegel, for example, treated the doctrines and institutions of Christianity; their rational meaning was sound, but their garb was that of the pictorial imagination. Since his interpretation excluded acceptance of the supernatural in its received sense, the effect was "revolutionary" as far as popular belief was concerned. On the other hand, thinkers who are most critical of the status quo are compelled, in order to get a foothold for intentional change, to accept and justify some features of the existing order, although their usual method is to resort to an idealized view of the ideas of an earlier epoch. Thus historic philosophies constitute a spectrum rather than cluster about opposite poles.

Irrespective of the tendency of a reforming philosophy to resort to a prior culture in which it is assumed that its own doctrines and ideals were embodied in a "pure" form, the generalized character of a philosophic statement renders it peculiarly available for formal transfer from one cultural situation to another. The actual state of the world and of science in the mediaeval period, when Christian doctrine was formulated in a metaphysical theology that also embraced the entire universe of extant knowledge, had little similarity to the culture of the time in which Aristotle wrote. Nevertheless, the abstract generality of the latter made it possible for the scholastics to use Aristotelian doctrines as the intellectual framework of their system. The administrative genius of Rome was alien to free speculation, but it fell back upon Greek philosophers to achieve a formulation which would be sufficiently comprehensive to meet the complex needs of the empire. The dawning science of the Renaissance reverted to Platonic and pre-Socratic thought in order to achieve emancipation from fossilized Aristotelianism. In spite of the distance that separated the territorial national state of the nineteenth century from

the small city-state of antiquity, Hegel and his followers employed the political philosophy of Plato and Aristotle to interpret and justify the structure and procedures of the European states of their day. The thought of Spinoza, condemned in his own time, came to life in the non-mathematical organic vitalism of Herder and Goethe. In general it may be said that the philosophies that seem to their immediate contemporaries to be wilful novelties (because they depart from doctrines that have become conventionally current) are more often in line with some great traditional current than are the intellectual fashions that cry out against them. For the former go back and lay hold upon some leading generalization that has become obscured.

The specific cultural contributions of philosophy have been in natural science and the social disciplines, the latter including education. Philosophy has been the matrix within which the conceptions that have given new direction in both the physical and the human fields were conceived and nourished. It has served this purpose in two ways, the first of which is comparatively accidental and external, although one that has at times been practically helpful to the progress of scientific inquiry. For example, there can be little doubt that the acceptance of mathematical mechanics for interpreting physical phenomena was facilitated (in its struggle with the qualitative teleological science inherited from Aristotle) by Descartes' dualistic separation of the material world from mind and by the use that he made of a thoroughly spiritualistic rationalism and theism to explain the nature and justify the role of mathematical conceptions.

The really important role of philosophy in science, however, is intrinsic. The notion that science proceeds merely by the accumulation of observations unregulated by theory has no support from the history of scientific inquiry. There is a basic reason for this. Fruitful observations cannot be made nor can their results be arranged and coordinated without the use of hypotheses, of ideas that go beyond the existing state of knowledge. The origin of modern science is to be understood as much by the substitution of new comprehensive guiding ideas for those which had previously obtained as by improvement of the means and appliances of observation. By the necessity of the case, comprehensive directive hypotheses belong in their original formulation to philosophy rather than to science. For they outrun past knowledge and even the possibility of adequate test by contemporary

means to such an extent that they are speculative in nature. Only later do they become an accepted part of that body of beliefs that is termed science.

Cases in point are the mathematico-mechanical conceptions that played such a part from the time of Descartes and Newton; the idea of evolution that was developed speculatively and applied to human history long before it could be used to direct specific inquiries in geology and biology; the doctrines of the conservation of matter and energy and so on. Indeed conceptions that are now the commonplace foundations of science and that seem to be self-evident in clarity are, if traced back, philosophical in origin. Such is the case, for example, with the ideas of motion, matter and energy, of atoms, of continuity and discreteness. But it must not be understood from this statement that philosophy has some inherent sovereignty over science. It means in fact that the division between philosophy and natural science is often arbitrary. What actually exists is a certain division of labor, in which the more speculative and hypothetical phase of intellectual activity is distinguished as philosophical and the more detailed and specifically verified part as scientific. The distinction that is made, *ex post facto*, is of temporal aspects of development rather than of something intrinsic. While it is true, as Lewes and some of the positivists have contended, that what was once philosophy is now science, the conclusion that philosophy is bound ultimately to disappear in science does not hold, at least not unless significant advance in science is to come to an end. For it is equally true that the generative ideas of future science will appear first in a speculative or philosophical form.

The intrinsic need of scientific progress for free speculation is reenforced by a cause which is moral or psychological in character. The human mind is subject, in its higher as well as in its more casual and directly practical activities, to the principle of habit and inertia. When scientific investigation gets definitely launched in a given direction, depending upon certain guiding ideas, it tends to move in grooves. Even when difficulties are encountered, the tendency is to follow the line of least resistance and to make some minor adaptation in the directive concept instead of trying some other principle. The use of epicycles in Ptolemaic astronomy is an example of a principle not confined to astronomy. All scientific theories tend to assume at some stage an epicyclical form. Thus it often

happens that a philosopher, approaching the matter from a different point of view from that which obtains in current science and breaking loose from concepts that have become conventional through use, will initiate a fruitful line of inquiry. Even ignorance or lack of specialized knowledge may be an aid in freeing imagination and permitting the generation of ideas that give a new direction to interest and attention.

It is not claimed of course that this particular role of philosophy with respect to science has always been beneficial. Sometimes positive inquiry has been either started off or else confirmed in lines that lead nowhere by philosophy. There has been an overproduction in philosophy of speculative hypotheses, especially with respect to those advanced as being proved by intuition or reason apart from experimental evidence. Nevertheless, the philosophic function is indispensable, and a certain amount of excess production and seeming waste is necessary in order to insure freedom and flexibility in scientific advance.

The cultural role of philosophy has been even more extensive in social and political theories and the practical movements connected with the latter than in the natural sciences. Indeed it would be difficult to find in the social disciplines an important idea whose origin cannot be traced to one or another historic system of philosophy. The thoroughness with which philosophic ideas have been wrenched loose from their original context and given a career of their own in jurisprudence, political science and economics is the chief reason why their origin in philosophy can so easily be ignored. The influence of Greek philosophy upon Roman law, partly through the stoics and partly by more indirect channels, has already been alluded to. The very concept of law was indeed philosophical in origin. The idea of the "law of nature" was central in the ethical and political theories of the scholastic thinkers, and the organizing principle of all jurisprudence. It was given a new interpretation in the sixteenth and seventeenth centuries and became at the hands of Grotius the generating, directive idea of international law as regulative of war and peace. It is almost superfluous to point out the practical influence of the conception of natural rights in the seventeenth and eighteenth centuries and its effect upon the formation of political constitutions as well as upon court decisions far into the nineteenth century—nor is its power exhausted even now. Yet the idea originated not

in legislative or judicial halls but in abstract theory.

The concept of sovereignty, which has had such an enormous role in political organization and practise, was quickly taken up by statesmen and made the basis and justification of their activities. But for the most part the idea received reasoned formulation at the hands of philosophers, in its extreme form by Hobbes and Spinoza and in its limited, or "liberal," form by John Locke. John Austin could not be classed as a philosopher in the technical sense of that term, but he (like Jeremy Bentham, who was specifically a moral and political philosopher) is not explicable historically apart from a philosophical tradition that includes Hobbes and also a thinker very different from Hobbes, namely David Hume. The entire conception of what Bentham called the "omnicompetence" of the legislature is strictly philosophical in origin.

As in the case of the natural sciences, many of the ideas borrowed by political theory and taken over into practical political life have had unfortunate consequences. This is particularly true because as a rule these ideas and their rational support have been set forth as if possessed of universal validity, instead of as directive intellectual instrumentalities for particular periods. Hence they have often had their greatest influence in a sense opposite to that entertained by their original promulgators. The use made in the nineteenth century of the doctrine of natural rights, or of liberty of contract, to protect property in a privileged position is a case in point, for in its early phase it was a weapon of attack upon the class then having legal and political control. Nevertheless, the role of philosophy is indispensable if political activity is to rise above rule of thumb procedure. Only leading ideas, not themselves verified at the time or indeed verifiable in a strict positivistic sense, can bind together the mass of empirical details of political practise into an organized whole and thus canalize aspiration and endeavor toward definite ends.

What is true of law and politics is equally true of economics. In Plato and Aristotle economics is definitely subordinated to politics; and politics is a branch, the most important branch, of ethical theory. Upon the whole this conception remained dominant into the seventeenth century. The rise of the natural sciences produced in the eighteenth century a new conception of nature and of natural law, now distinguished not

from positive law but from artificial, man made regulations. Social phenomena were regarded as expressions of human nature in a definite technical sense whereby "nature" was set over against deliberate and conscious arrangement and control, the latter being artificial. The consequence was that economic relations like that of supply and demand were treated as "natural" laws, and political relations as artificial and secondary. The philosophical psychology associated with classic political and legal theory had set up ideas and reason as the ruling factors in man. The theory of human nature which the philosophy of economics brought forward treated wants as fundamental and ideas as subordinate. "Reason" was merely the power of calculating the means by which desires could be satisfied economically and effectively. This mode of theorizing coincided with the growth of industry following the industrial revolution and was used as a weapon to free commerce from regulations adapted to feudal agrarianism but now operating to shackle human activity. The alleged "scientific" form of the psychology that was employed disguised the strictly philosophic character of the basic ideas of the new economics and of the whole laissez faire economy and politics.

There is an obvious reason why the affiliation of philosophy is more intimate in the case of the social sciences than in that of the physical. The former are more directly connected with problems of policy, and problems of policy all involve ends and purposes, and hence judgments of value. This fact is peculiarly conspicuous in the career of philosophy as matrix of educational theory and practise. Every important movement in education having conscious direction, that is, every one that does not follow tradition and custom, has been initiated by some philosophic development. The basic educational import of Plato's philosophy is clearly brought out in his *Republic*; and while it had no practical effect in its own day, its conception of the relation of education and social reform has since inspired members of different schools of thought. The fact that the philosophers of the mediaeval period are known as the schoolmen and that the philosophy of the period has the name of scholasticism is sufficient evidence of the close union of philosophy and education during that period. John Locke wrote specifically upon education of the young and his theories played a decided role in shaping Rousseau's *Émile*. It is probable also that the influence of his essay on human

understanding and his treatise on civil government in formulating the intellectual creed of liberalism had an even more marked effect upon subsequent educational ideas than his express writings on the subject. The conception of the omnipotence of education in forming mind and character, presented most explicitly by Helvétius, was a direct outcome of Locke's theory of the receptivity of the mind to impressions from without.

The two leading directions of educational thought in Germany in the early nineteenth century were set by philosophy. The dominant theories of method in instruction and discipline were derived from the thought of Herbart. The conception of education as an expression of national culture and a means of maintaining its vitality came from the idealistic school. While the most striking single manifestation of this fact is the influence of Fichte in promoting a moral revival after the Napoleonic defeat, the influence of the Hegelian philosophy of history and the state permeated far beyond the bounds of strictly Hegelian circles. In Great Britain John Stuart Mill and Herbert Spencer carried over into education the influence of the opposed empirical school, Spencer in particular constituting himself the champion of the claims of natural science.

In addition to the definite services of philosophy in generating ideas that inspire and direct thinking in the physical and social fields, philosophy exercises a third and rather indirect and vague function. Although few philosophers have found a significant aesthetic form of expression for their ideas, when expression is judged by the criterion of literature, nevertheless philosophy performs for some exactly the same office that the fine arts perform for others. There is a kind of music of ideas that appeals, apart from any question of empirical verification, to the minds of thinkers, who derive an emotional satisfaction from an imaginative play synthesis of ideas obtainable by them in no other way. The objective side of this phenomenon is the role of philosophy in bringing to a focus of unity and clarity the ideas that are at work in a given period more or less independently of one another, in separate cultural streams. Much of the culture characteristic of the eighteenth century is summed up for all subsequent history in the Enlightenment, and the Enlightenment is definitely a philosophical synthesis. The same is true of the romanticism of the nineteenth century, especially in Germany. It applies also

to the vogue, during the latter part of the nineteenth century, of the idea of universal evolution. The significance of such synthesizing ideas is more or less independent of the question of verifiability. The human mind, taken collectively, experiences the need of holding itself together, and during periods of rapid influx of new materials and the inception of new and diverging tendencies, accomplishes this task by means of comprehensive speculative ideas.

On the other hand, the failure from the standpoint of verifiability of these adventures in synthesis is one cause, and a rather large cause, of the comparative eclipse of philosophy in recent days. If such ventures were frankly offered as imaginative, without claiming objective truth, it is probable that the reaction against philosophy provoked by them (and largely in proportion to their previous vogue) would not occur. The positive cause which accounts for the recent comparative decline of the prestige of philosophy is found, however, in the tremendous multiplication of specialized knowledge and in the irreconcilable divergences among social tendencies characteristic of the present time. Uncertainty in the position of religion, due to its affiliation with a supernaturalism that is discredited from the standpoint of natural science; the enormous mass of specialized detail in science; sharp conflicts between movements in politics and economic life, between tradition and innovation, have often forced philosophy into either taking sides and becoming the intellectual partisan of a particular movement, or else withdrawing completely from the field of vital common experience and becoming itself another technical mode of specialization. The recent general revival of formalism in philosophical thought is probably to be accounted for on this basis. Judging from past history, this divided and crippled state of philosophy is a transitional phenomenon, preliminary to the appearance of comprehensive even if rival formulations, as subject matter is better digested and the lines of cleavage in social movements become more articulate. From the standpoint of culture philosophy is a perennial adventure of the human spirit.

PHOTIUS (c. 820-c. 891), Byzantine scholar and patriarch of Constantinople. Photius, who was destined to become one of the chief representatives of classical erudition in Byzantium, was born of an eminent family at Constantinople; he was a nephew of the patriarch Tarasius and was related to the Amorion imperial family. After distinguishing himself as a student he engaged in teaching, under conditions which are still unknown. It is established at least that he had as disciples the two brothers Cyril and Methodius, the future apostles of the Slavs, and that his home was a meeting place for scholars, a sort of academy where the works of ancient authors were read. His *Bibliotheca* (*Myriobiblion*), composed of notices and extracts especially of historians, orators and grammarians, affords an idea of these works, as do his *Amphilochia*, essays of all sorts, in part theological, addressed to Amphilochios, metropolitan of Cyzicus. Photius was a friend of Caesar Bardas, the uncle of Michael III, but the part he played in the reorganization of the imperial university in the Magnaura palace is unknown. Photius was made *protosekretis* (first secretary of state) and *protospatharios* (first sword bearer) and was sent as ambassador to Bagdad around 856-58; he allied himself with certain Moslem emirs, one of whom, a Cretan, was his disciple. In 858 as a result of a violent dispute which broke out between Caesar Bardas and the patriarch Ignatius, leader of the group of monks opposed to the scholars, the latter was exiled, and Photius, a simple layman, was consecrated as patriarch on Christmas Day. This appointment, which was not without precedent in Byzantium, evoked protests on the part of Pope Nicholas I; but Bardas and Photius outwitted the legates sent to Constantinople and Ignatius was deposed by a council in 861. This news caused the pope to

denounce his legates and to excommunicate Photius in 863. After five years of vain negotiations Photius decided to break with Rome, and in 867 he published an encyclical in which he attacked vigorously all the liturgical and disciplinary usages of the Roman church, insisting above all on his doctrine of the double procession of the Holy Spirit, which had been denounced as heresy. This document has remained the point of departure of the Greco-Roman schism in the Catholic church.

The close of Photius' career was marked by considerable agitation. In 868 Basil I, the Macedonian, his personal enemy, became reconciled with the pope and had Photius deposed by an oecumenical council held at Constantinople in 869-870. Ignatius was once more established in the patriarchate but died in 878. After reconciliation with Basil, Photius again became patriarch and was recognized by Pope John VIII (Council of Constantinople, 879) with certain reservations. In 886 Basil's son and successor, Leo VI, had Photius deposed a second time and he died in exile.

PHYSICAL EDUCATION proceeds from those activities which contribute to the normal growth and the efficient functioning of the human body. The character and importance of physical education in a social order are influenced by the bellicosity, religion, philosophy, economics, aesthetics and social ideals of the group. Physical efficiency under modern business conditions differs from physical efficiency in a feudal society, for example, and necessitates a different type of physical education. In primitive and pioneer societies big muscle activities consist in chasing game, bearing burdens, lifting, pulling, climbing, dancing and participation in athletic contests, while the making of tools, weapons and ornaments provides training in neuromuscular skill. Civilization destroys this mass participation in varied muscular exercise and it becomes necessary to promote physical

growth and efficiency through an established program of physical education.

Ancient China, lacking in national ambition, in general unappreciative of individualism and indifferent to the beauty of the normal body, afforded a barren field for physical education. The long finger nails of the mandarin and the deformed feet of the women constitute grotesque evidence of this attitude. Similarly the mystic creeds of India minimized the importance of physical welfare and regarded bodily neglect and abnormality as a mark of religious distinction. On the training fields of Persia boys and young men were taught "to ride, to shoot and to speak the truth," a physical and moral education. The prevailing ideal was not an ascetic or an intellectual but a man of action, a satrap or a soldier.

Greek civilization from earliest times showed a many sided appreciation of the importance of physical education. The society of the Homeric age, although rustic and simple, honored athletic prowess, manifested a high degree of sportsmanship, attributed to the contests a religious significance and incorporated the stories of the games into epic poems and folklore. In Sparta gymnastics (from *gymnos*, naked) was only a part of the state administered program which had as its objective the development of a race superior to all others in physical courage and stamina. The importance which the Athenians attached to physical education is reflected in the existence of boys' gymnastic schools (*palaestrae*); in the number and size of the public gymnasia, which were frequented by men of all ages; and in the symbolic use of the athletic figure in sculpture, in vase painting and in coinage. Greek philosophers and physicians valued physical education in terms of physical and mental fitness, beauty, resistance to disease and national defense. The sportsmanship of the people is indicated by the regulations governing the contests, in the odes to the victors, in the simple wreath as the official prize. A close relationship between religion and physical well being is apparent from the fact that the Olympic games were held in honor of Zeus.

During the early period of Roman history physical education, military training and moral discipline were closely allied and had as their common objective war and national defense. With the decline of the empire simplicity gave way to luxury, free labor to slavery, patriotism and discipline to civic and moral laxity, sports fields to the *thermae* and athletic competitions

to the more spectacular shows of the circus and the arena.

The converts to Christianity condemned worldly pleasures and taught that the flesh was of the devil and the soul was of God. This doctrine led to an exaltation of asceticism and bodily mortification as a means of subduing the flesh and winning salvation, an emphasis in which physical education, hygiene and sanitation were notably absent. With the Renaissance came a diminution in the importance of the hereafter and a corresponding stress upon the factors of pleasurable activity and individual achievement during earthly existence. This transition to humanist philosophy was expressed by a renewed interest in games, swimming, physical exercise, training in the use of sword and rapier, and in horsemanship.

The appearance of Rousseau's *Émile* convinced educators of the time that the normal physical growth of a child is of first importance and should take precedence over all other education. Among the German advocates of physical education during the decades following were Johann Guts-Muths, who asserted that physical exercises, athletic competitions and swimming could be made a part of the school program; Friedrich W. Fröbel, who stressed the importance of the instinct to play as an agency in general education; and Friedrich Ludwig Jahn, who believed that the only hope for the regeneration of Prussia lay in the mental, moral and physical education of youth. Jahn's program included the development of physical skill and stamina through such activities as running, jumping, wrestling, climbing, hiking, swimming, apparatus work and group games and led to the organization of the *Turnvereine* (gymnastic societies), which had as their objective physical education and recreation together with liberalism in government and religion. Adolf Spiess established physical education as part of the regular school curriculum in the boys' and girls' schools with which he was connected in Switzerland and Germany. The formalism characteristic of nearly all school activity permeated his gymnastics and gave rise to the free movement exercises, or calisthenics, whereby a teacher may give intensive movements to a large class in a brief time. From the foundations laid by these pioneers the German people developed a national interest in physical education.

Since the World War Germany is again looking to recreation and physical development of the masses as a means of national rehabilitation.

This movement manifests itself in the increased membership of the *Turnvereine* and athletic clubs, in the popularity of hiking organizations (*Wandervögel*), in the abundance of gymnastic and athletic literature and in experimentation with new ideas and methods in physical education.

In the Scandinavian countries during the eighteenth and nineteenth centuries there was a similar recognition of the close relationship between the physical efficiency of the citizenry and their willingness and ability to defend the fatherland. Influenced by Franz Nachtegall, Denmark in 1814 was the first modern nation to require a physical education program in the schools. In Sweden, Per Henrik Ling, who was a student of anatomy and physiology, perfected a system of exercises which were later to develop into the Swedish medical gymnastics. Under his direction the Royal Central Institute of Gymnastics was opened in Stockholm in 1814 and became the leading normal school for teachers of the Swedish methods. In recent years the system of primitive gymnastics developed by Niels Bukh at the Gymnastic High School at Ollerup, Denmark, has attracted wide interest both in Europe and America.

From Germany, Sweden and Denmark the theory and practise of physical education spread to Holland, Belgium, Poland, Bohemia and Switzerland. France, Italy and Spain were less influenced, chiefly because of the lack of adequate leadership. Attempts were made in France during the nineteenth century to require compulsory gymnastic exercises in the schools, but since the laws did not apply to ecclesiastical schools, they reached only a small percentage of the children. In the army modified forms of Swedish and German gymnastics were employed by both Italy and France. The extension of the movement to the British Isles took a somewhat different form. In contrast to the more or less military gymnastics prevailing on the continent, English physical education found its expression through outdoor sports, games and mass activities practised since earliest times. Sporadic efforts were made to introduce the Ling system into the army during the 1840's, but so far as the schools were concerned no concerted program of physical education appeared until the close of the century. Since 1900, when investigations into the health of school children revealed a prevalence of physical defects, advocates of physical education have induced the government to promote systematic training in the schools.

Concomitant with the geographical diffusion of physical education came a gradual shift in its emphasis. A growing interest in physiology led to a recognition of the value of regular exercise for civilians as well as soldiers, adults as well as children, healthy individuals as well as those who were physically defective. Systematic physical training came to be regarded both as an agent for the promotion of health and bodily vigor and as a means of correcting defects. Moreover from a special privilege available only to the aristocracy and the military it spread to the entire community, until today in most countries facilities for physical education exist for all classes.

Physical education in the United States dates from the early 1820's, when Charles Beck and Charles Follen, political refugees and members of the German *Turnvereine*, came to America. Follen became the first gymnastic instructor at Harvard and Beck, who joined the faculty of the Round Hill School at Northampton, Massachusetts, became the first teacher of physical education in an academic secondary institution. At the request of several leading citizens of Boston Follen opened a public gymnasium in 1826, the first of its kind in the United States. During the years 1848 to 1850 the German populations in several large cities organized *Turnvereine*, which provided recreation, physical education and cultural entertainment for members and their families. The American Turnerbund (union of *Turnvereine*) was organized in 1850; in 1932 it comprised 150 societies, with a total membership of 26,659.

The Young Men's Christian Association, which originally confined itself to religious teaching, adopted a program of athletics and gymnastics in 1860 largely as "a safeguard against the allurements of objectionable places of resort." The Young Women's Christian Association took a similar step about 1880. Today the gymnasium and swimming pool are regarded as indispensable and reflect the changed attitude toward the place of physical education in the association programs.

In universities and colleges physical education derived its impetus largely from the efforts of President William A. Stearns of Amherst College, who urged his board of trustees in 1855 to establish a department of physical education so that the health of the students might be safeguarded and frequent "breakdowns" prevented. A gymnasium was completed in 1860 and a department of hygiene and physical education was

organized. Harvard built its second gymnasium (the Hemenway) in 1879 and secured as its director Dr. Dudley Allen Sargent, who contributed much to physical education throughout his long service, especially with regard to individual exercises and the invention of machines designed to develop certain parts of the body and to correct specific defects. Present day college physical education departments have received larger and finer gymnasia, but few have been able to surpass the work of the early models. In women's schools and colleges active physical training was at first frowned upon as injurious to the feminine constitution and socially inappropriate. It was not until the closing decades of the nineteenth century that physical education and programs of athletics and games for women appeared in colleges and universities.

Among the factors which operated to place physical education in an important position in the curriculum of the public schools should be mentioned the enthusiastic lectures of Dr. Dio Lewis in 1860, the agitation of the *Turnvereine* for more time and better facilities, the work of Hartvig Nissen and Baron Nils Posse in promoting the Swedish methods during the 1880's, the founding of the American Physical Education Association in 1885, the literature of the followers of Delsarte in the 1890's and an ever increasing interest in play and in organized athletics as agencies in general education. As early as the 1850's physical exercises were introduced in the schools of numerous cities, among them St. Louis, Boston and Cincinnati, and by 1895 educational leaders agreed that a physical education program was indispensable. Interest in physical education increased rapidly in the following decades, especially during the World War, and by 1932 thirty-five states had passed laws making physical education compulsory in the public schools.

Physical education is an important feature of many institutions. In the schools it contributes to normal physical growth and serves to emphasize cooperation, teamwork and good sportsmanship. In colleges the physical education program offers recreation from mental strain and encourages students to strive for and to value physical fitness. The objectives of the men's and women's classes in the athletic clubs and *Turnvereine* as well as in churches and religious associations are physical welfare, from the point of view of health and aesthetics, and sociability. Physical education is an important by-product of the public health and social welfare move-

ments and an integral part of playground and settlement activities as well as of numerous scouting, swimming, golf, tennis and other athletic organizations, including those supported by government subsidies, as is frequently the case in Europe, and those sponsored by philanthropic enterprise.

In nearly every country the World War served to give a new impulse to physical education. In conjunction with public hygiene and sanitation it has been fostered by both military and educational authorities as an effective agency of national regeneration. Schools for training teachers have been established within recent years at Prague, Vienna, Paris, Budapest and Rome, in some cases under the direction of national ministries of physical education and hygiene. Under the Fascist regime in Italy there has been a definite effort to promote physical education and mass athletics. In Turkey traditional opposition to sports and athletics has been overcome by the present government, which has established an official school of physical education offering training to women as well as to men. Japan, China and other oriental countries are witnessing a similar introduction of physical education, a movement which resulted largely from the effort of missionaries who laid considerable emphasis on play activities in the school curriculum. Probably the most marked change has come about in Soviet Russia, where a concerted effort to popularize physical education is made through political organizations, labor unions, youth groups, rest homes and sanatoria as well as through the schools. In all cases the movement is coupled with the broader emphasis on public health, hygiene and sanitation.

The controversies among the advocates of the various "systems" of physical education are no longer heard. The modern physical educator desires only to make his program profitable to his pupils. He draws upon the Swedish and German methods, utilizes games and dances of all countries, tries out the fundamental gymnastics of Niels Bukh and the expressive gymnastics of Dr. Rudolf Bode, acquaints himself with the German rhythmic movements and with the natural movement advocated by Dr. Thomas D. Wood and Dr. Jesse F. Williams of Teachers College, New York, devises programs and exercises to suit his particular pupils and uses efficiency tests to interest them and to measure their achievements. Outside the gymnasium and the athletic field the physical instructor is a pro-

motor of folk dancing, hiking, camping and all forms of outdoor recreation. Physical education is coming to be regarded as an increasingly important aid to the profitable employment of leisure time and as a means of offsetting the detrimental effects of the machine age.

PI Y MARGALL, FRANCISCO (1824-1901), Spanish publicist, political theorist and politician. A Catalan by birth, Pi y Margall studied at Barcelona and Madrid and achieved a reputation as a critic of literature and the arts before he became active in politics. After the revolution of 1854 he published *La reacción y la revolución* (Madrid 1854), a volume of political and social studies. Thereafter he took a leading part in political debates and definitely formulated his own political ideas. Aware of the extreme variety of regional development in Spain, he held that Spain must be organized as a federation, but not in mere slavish imitation of federal governments already established, such as those of the United States, Germany and Switzerland. Pi y Margall's federalism was influenced by Proudhon and its ideological basis was the expansion of the principle of liberty; the assurance of freedom for the natural person in the sphere of individual autonomy; municipal liberty and a

consequent field of activity reserved to municipalities; a group of functions proper to a region and accordingly a regional state with peculiar powers; and, finally, a superior order of national integration.

Pi y Margall was elected deputy to the Cortes in 1868 and campaigned openly for republicanism and federalism. In 1873 when the republic was established he became a member of the government and for a short time served as president. After the restoration of the monarchy in 1874 he continued to struggle for his ideals. He was elected to the Cortes in 1886, 1891 and 1893. The first to foster the federalist idea in Spain, he organized the Republican Federal party and his doctrines have made a deep impress upon modern Spanish political thought. His program, which was broad in scope but minute in detail and offered solutions for all problems pertaining to the state, took special cognizance of social questions; it advocated protection of the working classes and the development of public education.

Pi y Margall translated Proudhon's writings into Spanish and was the author of a number of works on politics and economics, including *Las nacionalidades* (Madrid 1877, 3rd ed. 1882) and *Lecciones de federalismo* (ed. by J. Pi y Arsuaga, Barcelona 1931). Among his writings on history his study of America before the discovery, *Historia general de América* (2 pts., Madrid 1878-88), is noteworthy. He contributed to a number of periodicals and in 1890 founded the weekly *Nuevo régimen*, a party organ.

PIERSON, NICOLAAS GERARD (1839-1909), Dutch economist, banker and statesman. As a young man Pierson went to England and the United States in order to study the cotton industry. His first article, on banking in the United States, appeared when he was only twenty. Returning to Amsterdam in 1861, Pierson entered the cotton trade and a few years later went into the banking business. In 1863,

in the course of the great controversy over the continuation of the note issue monopoly of the Nederlandsche Bank, Pierson, although a strong advocate of competition in general, wrote a pamphlet urging monopolistic centralization of note issue in order to prevent overissue. This pamphlet and his other economic writings in the *Gids* and the *Economist* led W. C. Mees, president of the Nederlandsche Bank and himself an economist, to effect Pierson's appointment in 1866 to the board of directors of that bank, of which he became president on the death of Mees in 1885. Although he had had no university training, Pierson was made professor of economics when the Athenaeum Illustre of Amsterdam was converted into a university in 1877. He retained the presidency of the bank until 1891, when he accepted the post of minister of finance. By 1894, when the cabinet fell, he had succeeded in putting through several significant reforms in line with his view that taxation should be based upon ability to pay. He eliminated or reduced most of the indirect taxes and converted the business tax into a general income tax, with separate provisions for income derived from property and other sources. Pierson again entered the government in 1897, serving as prime minister and minister of finance until 1901; his administration was marked less by fiscal reforms than by progress in social legislation. From 1905 almost until his death he was a member of the Second Chamber. On his seventieth birthday a group of friends established the Pierson Foundation in his honor.

Pierson's most important work was his *Leerboek der staathuishoudkunde* (2 vols., Haarlem 1884-90, 3rd ed. by C. A. Verrijn Stuart, 1912-13; tr. into English by A. A. Wotzel as *Principles of Economics*, London 1903-12, and into French and Italian). The book indicates his interest in the practical significance of economics as a means of improving material welfare rather than in pure economics. Pierson was one of the first economists to accept the theory of value of the Austrian school, but he was unable to free himself entirely from the influence of Smith and Ricardo. In methodology Pierson advocated the deductive method as the most fruitful, although he recognized the value of historical and statistical research as auxiliary tools. While his principal interest was in economic theory, Pierson produced a number of masterful studies in economic history and in the history of economic science. In his *Leerboek* he attempted one of the first comprehensive theories of the incidence of

taxation. He was a strong advocate of free trade and a vigorous opponent of Marxism. Pierson was the outstanding Dutch economist of his time and exerted a considerable influence through his clear exposition of economic principles in both his university lectures and his writings.

PILLET, ANTOINE (1857-1926), French jurist. Pillet was professor at the University of Grenoble from 1886 to 1896 and at the University of Paris from then until his death. He wrote copiously upon questions of international law but he is important rather as the leading French theoretician of the conflicts of laws. He is indeed one of the chief figures in this field after Savigny, whose specific doctrines he rejected but whose fundamental approach he really assimilated. Savigny conceived the bases of private international law to be the community of nations, and he sought to determine a conflict of laws by referring it to the jurisdiction to which it belonged by virtue of its peculiar nature. Pillet attempted an entire reconstruction of the conflict of laws by positing as fundamental the unity of public and private international law. The choice between laws is a question of securing the "respect of sovereignties," and the law of that sovereignty is to be preferred which has the most direct interest in the solution. The problem involved in this choice may be solved by considering the essential qualities of all laws. These are two in number and consist of "generality" and "permanence." The generality of a law, which requires that it must be applicable to all persons within a country, implies its territoriality; its permanence, which requires that its authority be uninterrupted from the moment of its promulgation, involves its extraterritoriality.

Since in a conflict of laws one or the other of these qualities must necessarily yield, it is necessary to have a criterion of choice. This is to be found in the "social purpose" of all laws which are intended primarily either for the protection of individuals or for the security of society. In the first case only they should be extra-territorial in their effects. Pillet emphasized the importance of international respect for "acquired rights" as a fundamental principle of the application of foreign law rather than as a principle of comity. Nevertheless, in common with all theoreticians of the conflicts of laws, Pillet recognized the exception of the *ordre public*; namely, the principle that public policy might justify the refusal to apply a foreign law when contrary to the interest of the local sovereign.

J. P. NIBOYET

Chief works: *Principes de droit international privé* (Paris 1903); *Traité pratique de droit international privé*, 2 vols. (Paris 1923-24); *Manuel de droit international privé* (Paris 1924), in collaboration with J. P. Niboyet. A series of Pillet's articles has been collected in *Mélanges Antoine Pillet*, 2 vols. (Paris 1929).

Consult: Niboyet, J. P., Gaudemet, E., and Lapradelle, A. de, Articles in *Mélanges Antoine Pillet*, vol. i, p. 1-15, 89-103, and 105-24; Wigny, Pierre, "La théorie des droits acquis d'après Antoine Pillet" in *Revue de droit international et de législation comparée*, 3rd ser., vol. xii (1931) 341-63.

PINEL, PHILIPPE (1745-1826), French psychiatrist. Pinel, the son of a liberal Catholic physician, was trained first for the priesthood but soon became interested in literature, philosophy, mathematics, natural science and medicine. In 1778 he removed to Paris, where he associated with the leading liberals of the period. When appointed physician of the Bicêtre in 1793 he undertook to eliminate the practices of binding the insane in chains and subjecting them to other gross brutalities and introduced administrative reforms in the face of strong opposition. He discontinued the drugging and blood letting of patients and instituted regularity of schedule, occupational therapy and considerate but firm management, using the straitjacket when he thought it necessary. In 1795 he became head of the Salpêtrière, where he also put into effect his humane policies, which, however, were not adopted widely in the treatment of the insane until many years after his death. While at the Salpêtrière, through a class in clinical medicine, he greatly encouraged the scientific study of insanity.

Pinel's most important theoretical works are

his medical classics *Traité médico-philosophique sur l'aliénation mentale ou la manie* (Paris 1801, 2nd ed. 1809) and *Nosographie philosophique* (Paris 1798, 6th ed. 1818). He sought physiological foundations for psychiatry but avoided materialism, which he held to be dogmatic metaphysics. He insisted on the need for scientific study, classification and treatment of the insane; his own classification of mental disorders was a distinct advance over all previous efforts in this field; he saw as causes of insanity heredity, environmental stresses and uncontrolled living. As a member of the faculty of medicine at the University of Paris he influenced many students, particularly his successor, Esquirol.

PINHEIRO FERREIRA, SILVESTRE (1769-1846), Portuguese statesman and publicist. Although Pinheiro Ferreira was trained for the church he abandoned an ecclesiastical career. As a young man he taught logic and philosophy at the University of Coimbra, following the sensationalism of Locke and Condillac. The suspicious attitude of the reactionary government compelled him to flee the country in 1797, but he was subsequently given diplomatic posts in Paris, The Hague and Berlin. From about 1810 to 1821 he was in Brazil, where he enjoyed the confidence of John VI; he was the first to recommend to the latter that he grant a constitution to his subjects. After the revolution of 1820 he held the portfolios of war and foreign affairs in the first constitutional cabinet in Portugal and favored the recognition of de facto governments without regard to the principle of legitimacy. According to Planas Suárez, Portugal became during his tenure of office the first state to recognize any of the new Hispanic American governments. Pinheiro Ferreira also sought a defensive alliance of free countries against the Holy Alliance. Upon the restoration of absolutism in 1823 he was exiled again and did not return to Portugal until 1842.

One of the most cultured and renowned Portuguese of his time, Pinheiro Ferreira published in Portuguese, French and English a great number of works on philosophy, natural science, public and private law and political economy, some of which enjoyed considerable influence

both at home and abroad. He was modern Portugal's first important writer in international law. In his legal philosophy he opposed to the concept of "the greatest good of the greatest number" "the greatest possible amount of good, as much for society in general as for each individual in particular"; he held, however, that society was formed in order to facilitate the enjoyment of the inalienable natural rights of the individual. M. B. Amzalak (*Do estudo da evolução das doutrinas economicas em Portugal*, Lisbon 1928) states that Pinheiro Ferreira was the first Portuguese economist to develop doctrines with a more or less accentuated socialist bias, which is evident in various of his writings including *Précis d'un cours d'économie politique* (Paris 1840).

PINSKER, JEHUDA LOEB (León) (1821-91), Jewish national leader. Pinsker was born in Poland but lived most of his life in Odessa. Having dropped the study of law, he took up medicine and became a practising physician. For many years he was a champion of Jewish assimilation and reform, but under the impression of the Jewish pogroms of 1881 he lost his faith in assimilation and became converted to Jewish nationalism. His *Autoemancipation, ein Mahnruf an seine Stammesgenossen von einem russischen Juden* (Berlin 1882, 2nd ed. Brünn 1903; tr. by A. A. L. Finkelstein, London 1891, and by D. S. Blondheim, New York 1916), in which he anticipated Herzl, was the first important formulation of the proposal for the territorial concentration of the Jewish people as a remedy against the dangers of antisemitism. Pinsker called upon the Jews to cease relying upon others and to bring about emancipation by the concentration of their own forces. Antisemitism, he de-

clared, is a psychosis caused by the abnormal situation of the Jews, who form everywhere a scattered and unprotected minority, a nation in spirit but not in body. Only by territorial concentration in a country of their own will the Jews become a normal nation and thus bring to an end the irritation which their presence provokes among the nations. Pinsker did not propose that Palestine should become the Jewish homeland but asked only for some suitable territory. His ideas, which seemed both utopian and contrary to the course of Jewish history, were rejected by the Jews of western Europe, to whom Pinsker had addressed his work. Pinsker joined the small group of Chovevei-Zion (Lovers of Zion), the first pioneers of Zionism among Russian Jewry, and became their leader. The first small group of young Jews set out in 1882 from Russia to establish the first Jewish agricultural settlements in Palestine. To help them and to concentrate the weak and disorganized efforts of the Chovevei-Zion, Pinsker convoked in November, 1884, a conference at Kattowitz, where there was formed a Committee for the Support of Jewish Artisans and Settlers in Syria and Palestine, with its seat in Odessa. The scope of the activity of the committee was very restricted; its appeal was mostly philanthropic and directed toward transferring the Jews to productive occupations such as handicraft and agriculture. But with all these limitations the movement led by Pinsker was the first step toward political Zionism. In his later years Pinsker himself came under the influence of the purely cultural Zionism of Ahad Ha-am.

PIRACY is the crime of robbery or of forcible depredation of persons and property on the high seas, comparable with the crime of banditry or brigandage on land. According to international law piracy is a crime against all mankind which is justiciable in the competent court of any country where the offender may be found or carried. Everyone moreover has the right to pursue, capture or exterminate pirates without declaration of war, By statute of various nations

other acts, not defined as piracy by international law, have been made to constitute piracy. Cases involving statutory piracy may be tried only in the courts of the nation making the enactment and when committed in areas within that country's jurisdiction.

The trade of preying upon commerce has flourished in many periods of recorded history, particularly in areas where civil authorities have been lax in patrolling sea routes. Sea rovers swarmed over the Mediterranean Sea to harass in turn the Phoenician and the Greek carrying trades. In the early period of Roman expansion the peoples of Cilicia and Pamphylia took to organized piracy. Countless cargoes were plundered and captured and passengers were sold into slavery until 102 B.C. when Antonius, a Roman praetor, embarked with Greek allies on a successful mission to clear the sea of pirates. During the social and civil wars sea robbery was again rampant until Pompey was entrusted with a fleet of 270 vessels to make the Mediterranean safe for legitimate commerce. From the third century A.D. to the collapse of the Roman Empire piracy once more became prevalent, for now Roman resources were so concentrated on the protection of the frontiers as to prevent the effective patrolling of sea routes.

During the Middle Ages pirates infested every sea. Organized bands of marauders operated from rendezvous in the Greek islands and along the eastern shores of the Adriatic. Still more expert and deadly to peaceful craft were the Moslem pirates who from the ninth century onward used their nests along the African and Spanish coasts for acts of piracy and for territorial conquests in Sicily and southern Italy. Altogether for a period of a thousand years the Mohammedan pirates of Algeria, Tunis and Tripoli partially closed the western Mediterranean to Christian shipping. While they plied their trade most actively within the Strait of Gibraltar, they might be encountered as late as the seventeenth century in the English Channel or far west in the Atlantic. Piratical Norse sea rovers in the ninth and tenth centuries raided sea going traffic along the coasts of northern Europe.

During the Middle Ages piratical acts were as numerous as land robberies. Even a reputable merchantman might turn pirate, if it chanced to meet a smaller ship. Accordingly merchant vessels were armed, sailed in fleets and were sometimes accompanied by convoys of armed ships. In the eleventh century the maritime cities of

Italy, whose prosperity rested on regularized commerce, sought to suppress piracy within their respective spheres of influence. Thus Venice crushed piracy first in the Adriatic and later in the eastern end of the Mediterranean. The Hanseatic League rendered a similar service for the Baltic. Venice, nevertheless, did not hesitate to plunder the shipping of eastern cities, particularly that of Constantinople. Genoa and Pisa owed their prosperity partly to their own piratical attacks on the shipping of rival cities. Other piratical deeds were encouraged by the law of wreck whereby goods washed ashore or left in a stranded vessel became the property of the owners of the adjoining shore. While the great inland seas were more effectively policed, piracy was still unchecked in the English Channel except for the few instances when private merchants embarked on punitive expeditions against English, Dutch or French offenders. French and Spanish pirates were active also along the south coast of England and about the Isle of Wight.

When the discovery of new trade routes in the fifteenth and sixteenth centuries brought western Europeans in contact with large supplies of gold, silver and the precious spices, piracy became significant in the economic sense. Conditions in this period were peculiarly favorable to the growth of piracy. New trade routes over which valuable cargoes were transported were opened up, while national navies had not yet been developed to such an extent as to facilitate the suppression of piracy. At the same time many seamen were being thrown out of work as naval forces were demobilized after the wars of the period. The harsh treatment, low pay and bad food of the sailors on shipboard were added incentives to revolt. The result was that many of them turned to piracy both to escape intolerable conditions and to seek tempting profits. Sometimes they mutinied against their officers and seized the ships, in other instances they joined pirates who had captured them. By an easy transition many privateers also became pirates. From the sixteenth to the eighteenth century the most profitable ventures in piracy were centered, not along European coasts, but in the routes of world trade, particularly the long sea route of the Portuguese to India and Spanish routes in the Caribbean and along the Spanish Main. The inability of the Iberian powers to enjoy the monopoly of the seas which had been awarded them by papal edict in 1493 rendered ineffective their attempt to exclude

navigators of other countries. Nor were the pirates of this period necessarily outlaws. With financial backing from prominent men at home and with the encouragement of their rulers, daring seamen, recruited chiefly from the *petite noblesse* and the middle class of France, Holland and England, challenged Spanish supremacy by raiding Spanish commerce. Smiled upon by fortune, by royal favor and by public opinion, they emerged as heroes in a patriotic struggle against Spain and as the builders of future empires for their mother countries. Nevertheless, these activities constituted piracy. Technically France and England were at peace with Spain in Europe, but it was tacitly recognized that the international law of Europe did not extend to the New World.

Those who preyed upon Spanish commerce in the New World were called buccaneers, or more generally corsairs or freebooters. Among the outstanding buccaneers of the sixteenth century were Hawkins, Cavendish and Drake. In 1572 Francis Drake sailed to the West Indies, where he plundered the Spanish treasure convoy, raided towns along the coast, despoiled two hundred trading vessels and arrived home with a great treasure, part of which went to Queen Elizabeth. Five years afterward he sailed around South America in his flagship the *Golden Hind*, seized rich prizes on the west coast and circumnavigated the globe. A century later Morgan, after a successful year of piracy, sacked Panama and returned to England, where a benevolent sovereign pardoned him for his crimes, conferred knighthood upon him and appointed him governor of Jamaica.

By 1665 the Caribbean freebooters were not only numerous but well organized, with their principal rendezvous on the island of Tortuga. Nominally under French rule, Tortuga was virtually a pirate state, whose governor gave every requisite, including fake commissions, to buccaneers of all nationalities. It was estimated that in 1717 there were 1500 pirates off the coast of the Carolinas. So keen indeed was the competition, and so lean were the pickings, that ambitious buccaneers forsook the Caribbean for the west coast and the Pacific. Among them was Captain Dampier, who looted Peru's silver fleet and Manila's golden galleons. Buccaneers of the type of Drake and Dampier occasionally proved their worth as explorers and cartographers of uncharted waters and unknown lands. Their exploits in the aggregate involved a new technique in shipbuilding, created a large unofficial navy

and an embryonic mercantile marine, while serving at the same time to awaken their compatriots at home to the possibilities of legitimate commerce in distant parts of the world.

Buccaneering on such a scale greatly embarrassed English traders. Morgan's administration as governor of Jamaica marked the first serious attempt to curb piracy in the Caribbean. With English men of war policing these waters, fake commissions failed to save suspicious characters from hanging. Nor could offenders henceforth rely on full pardons for their crimes after surrendering to the home government. By 1750 the swift sailing corsairs had been brought under effective control. The great age of piracy was over. National navies had been established and communications and transportation in general had been improved to such a degree that the seas could be policed fairly effectively. Piracy survived only under especially encouraging conditions.

At the opening of the nineteenth century piracy was still prevalent in three widely separated areas. The waters of the Caribbean once more attracted swarms of pirates when the revolt of the Spanish colonies resulted in the complete breakdown of colonial administration. The marauders were easily routed about 1816 by the combined navies of Great Britain and the United States. Meanwhile the Barbary pirates, with a sprinkling of renegades from other countries, were still making a business of piracy. Cargoes of passing merchantmen were plundered and captured passengers held for ransom or sold into slavery. The United States government resorted to war (ending in 1816) upon the Barbary powers, after diplomatic negotiation and the payment of tribute had failed to win immunity for American shipping. In 1816 a large fleet of English and Dutch warships under the command of Lord Exmouth bombarded Algiers, destroyed the Algerian fleet and achieved the rescue of about 1100 Christian captives. With the last of the pirates in the western world reduced to passivity, the coast of China remained as the final great rendezvous of pirates. During the first half of the nineteenth century Chinese natives and European traders were equally involved in high handed acts of piracy on the seas and in the harbors and rivers. Piracy was one of the issues in the Opium War and the Anglo-Chinese war of 1856. From the latter date to the close of the World War the great powers effectively patrolled the Chinese coast. In recent years, however, the collapse of

central authority in China has once more encouraged native pirates to operate.

The unrestricted submarine campaign of Germany in the World War created problems whose legality has not clearly been determined by international law. Among them is the question whether the sinking of merchant vessels on sight, involving the destruction of life and property of neutrals and non-combatants, constitutes an act of piracy. In a petition brought by the Cunard Steamship Company in the Federal District Court of New York for limitation of its liability resulting from the sinking of the *Lusitania*, it was held that this sinking was an illegal act on the part of Germany [The "*Lusitania*," 251 U. S. 715 (1918)]. In the Washington treaties of 1921-22 it was stipulated that submarines were not to be used as commerce destroyers. According to the provisions of the treaty signed by the United States, British Empire, France, Italy and Japan, no merchant ship, even though carrying contraband of war, may be sunk without specific warning, and due opportunity must be granted for the safety of all on board. Furthermore attack upon, or destruction of, merchant vessels upon visit and search by any person or persons in the service of any power was declared to be an act of piracy. According to this definition the precedent was established that offenders may be brought to trial as pirates before the competent courts of any power within whose jurisdiction they may be found.

PIRRIE, VISCOUNT WILLIAM JAMES (1847-1924), British shipbuilder. Pirrie was born in Quebec of Scotch-Irish parents and educated in Ireland at the Belfast Royal Academic Institution. At the age of fifteen he became an apprentice draftsman in the shipbuilding firm of Harland and Wolff at Belfast. In 1874 he was made a partner in this concern and later its chairman. The era of iron shipbuilding had begun, and it was largely through the efforts of Pirrie that Harland and Wolff as builders of the White Star Line and other trans-oceanic steamships developed one of the greatest shipbuilding yards of the world. Pirrie was lord mayor of Belfast in 1896-97, and in 1906 he was raised to the peerage.

During the World War Pirrie rendered valuable service to the British government as commercial adviser to Lord Derby, secretary of state for war. On account of the devastation wrought on mercantile shipping by German submarines responsibility for shipbuilding had been vested since 1916 in a single head. In 1918 it was decided to entrust the entire responsibility to a leader of the industry itself, and Pirrie was given the important post of controller general of merchant shipping. The German offensive had hampered the shipbuilding program by increasing the demand for labor and steel on the part of the Ministry of Munitions. Pirrie on his entrance to office, while adhering strictly to the prior claims of the Admiralty and Ministry of Munitions, hastened the speedy release from Admiralty work of yards previously allocated to merchant shipping. The output of British shipyards during the spring and summer months of 1918 rose well above the level of the corresponding seasons of the previous year.

In 1921, on the occasion of the king's visit to Belfast to inaugurate the new Parliament of northern Ireland, Pirrie was made a viscount. His last official service was that of chairman of the Agricultural Aid Committee for the relief of agriculture in northern Ireland.

PISAN, CHRISTINE DE (1364- c. 1430), French authoress and feminist. Christine de Pisan was probably the first woman to support herself by the profession of literature. She was born in Italy, in 1368 accompanied her father to the court of Charles V and passed the rest of her life in France. She was married at the age of fifteen to Étienne de Castel, who died ten years later, leaving her in great financial straits, with a mother and three young children to support. From 1399 she maintained herself and her family by her pen, composing and writing a series of poems and prose works of astonishing variety, in the service first of the house of Orléans and then in that of Burgundy. She inaugurated the quarrel over the *Roman de la rose*, which occupied court and literary circles in the early years of the fifteenth century and in which she defended her sex with such judgment and eloquence that she won the support of Gerson. In 1418 she retired to an abbey but continued to write. From the point of view of the social historian her most interesting works are her feminist writings, the group of poems and epistles connected with the *Rose* controversy and the two treatises which she wrote in 1405 for the daughter of Philip of Burgundy, *La cité des dames* (tr. into English, London 1521) and *Le livre des trois vertus*. The latter is one of the most important didactic treatises on the education and duties of women produced during the Middle Ages and is distinguished by its good sense and enlightenment.

J., *Christine de Pisan* (Paris 1927).

PITKIN, TIMOTHY (1766-1847), American politician and historian. Pitkin entered politics in 1790 as representative of Farmington in the general assembly of Connecticut. Subsequently as a member of the national House of Representatives from 1805 to 1819 he strongly opposed Jeffersonian policies and the War of 1812. In the Connecticut constitutional convention of 1818 he fought unsuccessfully to prevent the

complete severance of church and state and the constitutional guaranty of the rights of conscience. From 1819 to 1830 he was again a member of the state house of representatives.

While in Congress he wrote *A Statistical View of the Commerce of the United States of America* (Hartford 1816, new ed. New Haven 1835), a history of American commerce from the discovery of America, thickly interspersed with statistical tables, which remains today an exceedingly valuable study in economic history. Indefatigable in collecting historical data, he was recognized in his day as a leading authority on American history, and his *A Political and Civil History of the United States of America from the Year 1763 to the Close of the Administration of President Washington* (2 vols., New Haven 1828) is an accurate if dry account of the early republic written from the Federalist point of view. After his retirement from politics in 1830 he devoted his remaining years to further historical studies, which have not been printed.

PITT, WILLIAM, FIRST EARL OF CHATHAM (1708-78), and **WILLIAM** (1759-1806), British statesmen. For over half a century the two Pitts, father and son, dominated the parliamentary developments and the national life of their country. The elder Pitt, known as Chatham from the peerage he accepted in 1766, entered Parliament by way of the pocket borough of Old Sarum. His eloquence, his love of country, his indifference to financial reward during a period of extreme venality, won for him rapid parliamentary advancement. At the crisis of the Seven Years' War, when England's sun seemed about to set, Pitt "organized victory" with an arrogant and justifiable pride. As a war minister he has seldom if ever been excelled for dispatch and vigor. Believing that trade was a natural outlet for islanders he sought to advance the colonial expansion of England by annihilating the house of Bourbon in every quarter of the globe. On the accession of George III in 1760 he found it impossible to work with an autocratic king or his servile ministers. Pitt's intractable obstinacy, coupled with the king's determination to control the patronage, led to chaos for the first ten years of the reign. Although he had sympathized with the American colonials until it became apparent

that their revolutionary activities might entail a disruption of the empire, Pitt's inveterate hatred of France blazed out when he saw the Bourbons come to their assistance.

The younger Pitt, trained in the liberal Whig tradition, entered Parliament in his twenty-second year. With all his father's arrogance he refused a subordinate post in 1782. A year later a cabinet crisis brought him the premiership. During the remainder of his life, except for the period from 1801 to 1804, Pitt was absolute master of the House of Commons and of the nation.

Although not so distinguished an orator as his father, he wielded a greater influence. He cared even less than Chatham for honorary distinctions, and his one passion was to lead the House of Commons. Pitt's earlier ministerial career was distinguished by political and economic reforms of various kinds. Chatham's earlier efforts to correct borough "misrepresentation" by adding members to the counties were continued by his son in the 1780's, when reform seemed to be imminent as a result of the disastrous American war. The king, however, was averse, even with compensation to the disfranchised pocket boroughs. This failure, which postponed the attainment of parliamentary reform for another half century, has often been blamed on Pitt, who, it is argued, as an all powerful minister could have forced reform on king and Parliament had he wished to do so. Although parliamentary corruption was greatly lessened by Pitt's integrity and independent fortune, peerages were bestowed lavishly in order to insure the control of the House of Lords. Not the least of Pitt's achievements was the firm establishment of a new Tory party on a solid basis.

His financial measures were notable. Many sinecures were abolished, the debt was funded, the customs and excise were consolidated and duties were lowered to a reasonable level. The influence of Adam Smith had much to do with this part of Pitt's work. A commercial treaty was negotiated with France, while a similar arrangement for Ireland was abandoned only because of the opposition of commercial leaders in England. The establishment of a sinking fund strengthened the credit of the nation, even if its supposed value rested on fallacious grounds. Determined opposition, which Pitt might have overcome, led to a withdrawal of his efforts to abolish the slave trade and the discontinuance of steps to emancipate the Catholics.

The French Revolution and the ensuing Euro-

pean wars covered Pitt's last years like a pall. The liberalism of the preceding decade disappeared. Severe repression at home, the suspension of habeas corpus from 1794 to 1801, the suppression of free speech, the enforced union of the Irish Parliament with that of Great Britain by means of colossal bribery, the utter indifference to social problems, make the war ministries of Pitt a somber contrast to his earlier years. Pitt was as keenly interested in empire as Chatham. Early in the 1780's he fathered an India bill which placed the company under more direct control of the government. The separation of the Canadas in 1791 into two provinces was a needed recognition of changing conditions. During the French war Pitt's policy, which aimed at the capture of every available colony of the enemy, resulted in a considerable increase of Britain's naval and trading facilities when peace ultimately came.

PITT-RIVERS, AUGUSTUS HENRY LANE-FOX (1827-1900), English archaeologist and museum director. Pitt-Rivers was one of the first archaeologists to discover evidences of palaeolithic man in England and to find early flint implements in Egypt. The records of his intensive archaeological excavations of Roman and pre-Roman sites near Salisbury, England, are models in technique. As inspector of ancient monuments he was instrumental in shaping England's public policy respecting antiquities. Pitt-Rivers is best known, however, as the originator of a method of studying the development of technology and art through the arrangement of museum collections. He visualized a complete ethnographical museum as containing exhibits of two types, one in which objects were grouped geographically according to area in the traditional manner and another in which they were

classified according to form and structure to demonstrate genetic relations; in his extensive museum collections he specialized on the latter type of classification. He attempted, for example, to determine empirically from decorative objects the origin of conventional designs. He defended his method as scientific, regarding it as analogous to the comparative morphological procedures used in the study of languages and in zoology, but anthropologists have rejected many of the conclusions as to origin and sequence in his evolutionary classifications.

Pitt-Rivers was a pioneer in conceiving museums as educational institutions and in advocating that their exhibits should be so arranged that the fundamental relations in the materials presented could be easily comprehended by visitors. His excellent collection of specimens of human manufacture, derived largely from primitive cultures, was eventually housed at the University of Oxford; he also established the Pitt-Rivers Museum at Farnham.

PIUS II (1405-64), pope from 1458. Under the name of Aeneas Silvius he wrote during the conciliar period, when controversy between pope and church council foreshadowed the later contest between monarchy and representative democracy. At this time the theory arose that social institutions originated in the rational actions of men. To this idea Aeneas Silvius contributed in his "De ortu et auctoritate imperii romani" (reprinted in Goldast, M., *Monarchia sancti romani imperii*, 3 vols., Hanover 1611-14, vol. ii, p. 1558-66), in which the Biblical account of Paradise was combined with the ideas of Plato and Polybius to give a historical survey of the rise of man from the state of nature. Living originally like the beasts, men discovered through reason the value of association and deliberately created bodies politic. When oppressed they agreed to delegate authority to someone of outstanding virtue. Thus kingship originated. When, however, the king abused his power, he might be deposed by those who created him.

Natural rights, social contract, popular sovereignty and the right of revolution were embodied in his thought. His work was the first study of the nature and content of sovereignty.

R. G. GETTELL

Consult: Creighton, M., *History of the Papacy*, 6 vols. (London 1899-1901) vol. iii, p. 51-358.

PIUS IX (1792-1878), pope from 1846. Pius IX exercised an extraordinary influence upon the liberal and reform movement which agitated the entire Italian peninsula between 1846 and 1848. His progressive activities at that period were apparently inspired by the doctrines expounded by the philosopher Vincenzo Gioberti, who maintained that it was within the power of the papacy to initiate a regeneration not only of Italy but also of Europe in general by means of reforms which were to reconcile the Catholic tradition with the modern spirit. With the reforms carried out in the pontifical state between 1846 and 1848 Pius IX seemed to have embarked upon the road mapped by Gioberti. His progressive measures called forth great enthusiasm and high hopes among the Italian patriots and liberals, contributing to the development of the conditions which made possible the outbreak of the national and liberal Revolution of 1848 as well as of the Italian war against Austria.

But Pius IX changed his policies as soon as the events of 1848 began to go counter to his expectations, threatening the security of his state and arousing the suspicions and resentments of the traditionalists and of the German Catholics. He immediately cut himself loose from the liberal and national movement, repudiated the war against Austria and tried to direct the government of the pontifical state along conservative channels. This reversal gave rise to a vehement opposition on the part of the democratic elements. The pope was consequently compelled to flee from Rome in November, 1848, and to invoke the intervention of foreign troops against the republic proclaimed in that city in February, 1849. The Republic of Rome, which was governed by Mazzini and defended by Garibaldi, was able to withstand only for a few months (April-June, 1849) the attacks of the Austrian and French armies. But the episode entailed fatal consequences for the temporal power of the popes. Beginning with the summer of 1849 the antagonism between the Italian liberal and national currents became stronger, culminating in the movement which in twenty years was destined to bring about the

collapse of the whole pontifical state and to lead to the setting up of Rome as the capital of Italy. Pius, returning to Rome in the spring of 1850, was able to retain the state and temporal power only by resorting to the assistance of foreign troops and by combating the liberal movement energetically.

After 1861 the gulf between Pius IX and the Italian national and liberal state became unbridgeable. It was in vain that statesmen like Cavour, Ricasoli and Minghetti tried to effect a reconciliation by which the pope was to relinquish his temporal power of his own accord and to retain full spiritual sovereignty. Pius IX refused to entertain any idea of compromise, basing his resistance on the support of the French troops maintained at Rome by Napoleon III.

The collapse of the Second Empire after the battle of Sedan and the subsequent discontinuance of Napoleon III's protection naturally led in September, 1870, to another vehement clash between Pius IX and the Italian national state. The Italian troops attacked Rome and put an end to the sovereignty of the pope, an action which evoked the most vigorous protests on the part of Pius IX, who disdainfully rejected the conciliatory solution proposed by the Italian state through the Law of Papal Guarantees of May, 1871. Confined to the Vatican until his death, he remained rigidly intransigent to the end and refused to recognize Rome as the capital of Italy, thus creating a problem which persisted until the Concordat of February, 1929.

His antiliberal attitude after the experiment of 1846-48 was revealed not only in Pius IX's political attempts but also in his religious activities. Such acts as the issuance of the famous Syllabus of 1864, in which the errors of modern civilization were condemned, and the proclamation of the dogma of papal infallibility (July, 1870) merely tended to create conflicts and dissensions among the liberal Catholics themselves.
